Subject: Phase I Environmental Site Assessment and
Document Review
Portions of Former Lockheed Plant B6
Burbank, California

Dear Mr. Johnson:

Ardent Environmental Group, Inc. (Ardent) has performed a Phase I Environmental Site Assessment (ESA) and Document Review of Portions of the Lockheed Former Plant B6 property located at in the city of Burbank, California (site). Work was completed in accordance with Ardent's proposal dated October 29, 2015. The attached report presents our methodology, findings, opinions, and conclusions regarding the environmental conditions at the site. We appreciate the opportunity to be of service to you on this project.

Sincerely,
Ardent Environmental Group, Inc.

EXECUTIVE SUMMARY

Ardent Environmental Group, Inc. (Ardent) was retained by Overton Moore Properties (OMP) to perform a Phase I Environmental Site Assessment (ESA) and Document Review for portions of the former Lockheed Plant B6 property located in the city of Burbank, California (“site” or “subject property”). The site encompasses approximately 60-acres of the former 130-acre Lockheed Martin Corporation (Lockheed) Plant B6 property (referred to herein as the “larger property,” or “Lockheed Plant B6”). Lockheed formerly used Plant B6 for aircraft research, manufacturing, assembly, and maintenance. A number of environmental investigations and remediation have been completed over this larger property under the direction and oversight of the Regional Water Quality Control Board, Los Angeles Region (RWQCB) and Federal EPA. Lockheed has been identified as a potentially responsible party (PRP) to the Burbank Operable Unit of the San Fernando Valley Groundwater Superfund Site. The buildings associated with the former Lockheed Plant B6 property have been razed and the site is currently vacant land. OMP is considering purchasing the site for redevelopment for commercial purposes.

During this investigation, Ardent reviewed files from regulatory agencies and information obtained from the client. It should be noted that because the site was part of a larger property and shared addresses associated with the Lockheed Plant B6 facility, identifying on-site areas of possible concern or determining whether the appropriate investigation activities were completed was extremely difficult. Site assessment activities for this report were conducted between October 30, 2015 and December 21, 2015.

In summary, the following items were noted:

- The site was used for agricultural purposes or vacant land from at least 1928 through the late-1930s. From at least 1944 through the 1990s, the site was used for aircraft research, manufacturing, warehouse, maintenance, and office purposes. The site buildings were razed from 1997 through 2001. The site is currently vacant land, with the exception of a small portion of the northern property which is used by a company for long-term storage of automobiles and miscellaneous personal items in storage pods.
- The site is located within the San Fernando Valley Groundwater Basin which has been designated by EPA as a Federal Superfund Site due to groundwater contamination associated with historical industrial land uses. The areas of groundwater contamination, designated as “Operable Units,” contain chemicals such as volatile organic compounds (VOCs), namely trichloroethene (TCE) and tetrachloroethylene (PCE), and other chemicals such as hexavalent chromium and 1,4-dioxane. The site lies within the “Burbank Operable Unit.” A number of investigations have been completed over the years, and based on the results, Lockheed

has been named as one of many PRPs for contributing to the groundwater issues. Groundwater investigations completed at the site have shown elevated concentrations of PCE, TCE, and hexavalent chromium. Groundwater has been measured at the site at depths of approximately 220 feet below the ground surface (bgs) and flows in a southeasterly direction. Currently, there are three groundwater wells located on the site and groundwater monitoring is completed by Lockheed on an annual basis.

- The site was investigated in the early- to mid-1990s for possible VOC source areas as part of the Regional Water Quality Control Board, Los Angeles Region (RWQCB) Well Investigation Program (WIP) associated with the San Fernando Valley Groundwater Basin Superfund Site. Investigations began in 1991 with an in-depth environmental assessment of the site presenting a comprehensive study of the historical land use, operations, and areas of concern. Based on the results of this investigation, at least 35 underground features consisting of 25 fuel underground storage tanks (USTs) and 10 non-fuel USTs, sumps, and clarifiers were formerly located on-site. A number of areas of concern (AOCs) were identified including USTs, ASTs, sumps, clarifiers, surface stains, process lines, degreasers, trenches and floor drains, and chemical storage and handling areas. These AOCs were subsequently investigated, impacted soils remediated, and USTs and underground features removed. Based on these investigations, no further action (NFA) letters were issued by the RWQCB in 1996.
- As part of this Phase I ESA, Ardent reviewed these environmental reports and agency NFA letters. Based on our review and the fact that the site was part of a larger facility, it was difficult to determine whether all of the reported underground features had been properly removed from the site. In 1998, a geophysical survey was completed throughout the site to address the status of the underground features. Based on the results of the geophysical survey, no anomalies indicative of a UST were discovered. Based on this information, it appears that the reported USTs and underground features have been removed. In the 1990s, residual contaminants to be left in-place were evaluated by regulatory agencies based on the likelihood of migration to groundwater (i.e. for the protection of groundwater); with a lesser extent for the protection of human health. By the mid-2000s, agencies began evaluating in-place contaminants for the protection of groundwater and human health. Ardent completed a cursory evaluation of the chemical data of the residual contaminants that were allowed to be left in-place by the RWQCB in 1996. Ardent reviewed these data based on current regulatory guidelines based on human health risk criteria. Based on our review, there is a low likelihood that the residual contaminants would pose a human health risk through dermal contact.
- During completion of the earlier studies, soil gas investigations were completed as a screening tool to assess possible source areas of VOCs, and therefore, higher chemical detection limits were used. Current studies, used to evaluate human health risks, use much lower detection limits. Based on our evaluation of these historical data with respect to current human health risk guidelines, there is a high likelihood that residual contaminants could pose a potential threat to human health to future occupants through vapor intrusion.
- In the 2013, the RWQCB again requested investigations be completed at the site and surrounding properties to investigate possible source areas of hexavalent chromium that began being identified in close-by water wells. In 2014, an evaluation of on- and off-site AOCs was

completed based on historical land use information. A number of on- and off-site AOCs were identified on the surrounding Lockheed properties. Laboratory results of subsequent soil sampling completed in the on-site AOCs showed low concentrations of hexavalent chromium. Based on this information, the RWQCB concluded that there was a low likelihood that the site had contributed to the chromium issue. However, because additional investigations are still needed at other Lockheed properties in the site vicinity, this case is still considered open with the RWQCB.

- Asbestos-containing Transite piping is reportedly located beneath the site; the extent of which is unknown.
- During the site reconnaissance, Ardent observed a former Pump House associated with a 509,000-gallon water reservoir located in the mid-eastern portion of the site. Although these features are not considered an environmental concern to the site, these features will need to be managed during redevelopment activities.
- No other- on or off-site environmental issues were noted for the site.

Ardent has performed this Phase I ESA in general conformance with the scope and limitations of the American Society for Testing and Materials (ASTM) Practice E 1527-13, ASTM Practice E 2600-15, and the EPA Standards and Practices for All Appropriate Inquiries (AAI), Final Rule (40 CFR, Part 312), for a portion of the former Lockheed Plant B6 property located in the city of Burbank, California. Any limitations or exceptions encountered during completion of this report are stated in Section 1.4. No evidence or indication of recognized environmental conditions (RECs), or conditions indicative of releases or threatened releases of hazardous substances on, at, in, or to the subject property has been revealed, with the exception of the regional groundwater issues, reported Transite piping, and possible vapor intrusion issues.

Based on the results of this investigation, Ardent presents the following recommendations.

- A soil gas survey should be completed to assess current conditions at the site based on human health risk criteria. Following collection of the laboratory data, a Human Health Risk Assessment (HHRA) should be completed to assess whether a human health risk is present and whether engineering controls (e.g. a vapor barrier) are needed beneath the proposed building(s) to limit vapor intrusion.
- Due to the historical land use and residual contaminants known to exist at the site, a Soil Management Plan (SMP) is recommended to be prepared and implemented during grading/redevelopment activities. The SMP will document the program participants including contact information and description of responsibility, agency involvement, and health and safety measures. The SMP will also present procedures to be followed if impacted soil or unknown environmental features are encountered. This will include sampling criteria and analytical procedures.

- Since the existing groundwater monitoring wells are part of a larger monitoring program associated with the Federal Superfund Site, if the wells are needed to be abandoned and/or relocated due to proposed construction plans, authorization needs to be obtained from the EPA. Typically, the well owner/operator would obtain EPA approval.
- If during grading activities Transite piping is discovered, these materials should be removed by a State-licensed abatement contractor. The client should account for the mitigation measures in its grading budget.

1 INTRODUCTION

Ardent Environmental Group, Inc. (Ardent) was retained by Overton Moore Properties (OMP) to perform a Phase I Environmental Site Assessment (ESA) and Document Review for portions of the former Lockheed Plant B6 property located in the city of Burbank, California (“site” or “subject property”). Work was completed in general accordance with the proposal dated October 29, 2015 between OMP and Ardent.

The site encompasses approximately 60-acres of the former 130-acre Lockheed Martin Corporation (Lockheed) Plant B6 property (referred to herein as the “larger property,” or “Lockheed Plant B6”). Lockheed formerly used Plant B6 for aircraft research, manufacturing, assembly, and maintenance. A number of environmental investigations and remediation have been completed over this larger property under the direction and oversight of the Regional Water Quality Control Board, Los Angeles Region (RWQCB) and Federal EPA. Lockheed has been identified as a potentially responsible party (PRP) to the Burbank Operable Unit of the San Fernando Valley Groundwater Superfund Site. The buildings associated with the former Lockheed Plant B6 property have been razed and the site is currently vacant land. OMP is considering purchasing the site for redevelopment for commercial purposes. The following sections identify the purpose, the involved parties, the scope of work, and the limitations and exceptions associated with the Phase I ESA.

1.1 Purpose of Phase I ESA

In accordance with the American Society for Testing and Materials (ASTM) Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process (ASTM Standard E 1527-13), the objective of the Phase I ESA was to identify, to the extent feasible pursuant to ASTM Standard E 1527-13, recognized environmental conditions (RECs), which are defined by ASTM as “...the presence or likely presence of any hazardous substance or petroleum products in, on, or at a property: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment.”

The United States Environmental Protection Agency (“USEPA” or “EPA”) has stated that ASTM Standard E 1527-13, is consistent with the Standards and Practices for All Appropriate Inquiries (AAI), Final Rule (40 Code of Federal Regulations [CFR], Part 312) and is

compliant with the statutory criteria for all appropriate inquiries. All appropriate inquiries, as defined in the AAI Final Rule, must be conducted by persons seeking the landowner liability protections under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) prior to acquiring a property or seeking or receiving federal Brownfields grants under the authorities of CERCLA. The purpose of AAI, as defined in the AAI Final Rule, was to identify releases and threatened releases of hazardous substances which cause or threaten to cause the incurrence of response costs.

As part of this Phase I ESA, Ardent also assessed whether a vapor encroachment condition (VEC) exists at the site. The VEC assessment was completed following the ASTM E 2600-15 Standard Guide for Vapor Encroachment Screening on Property Involved in Real Estate Transactions (ASTM Standard E 2600-15). The objective of this work was to evaluate whether possible contaminants (e.g. volatile organic compounds [VOCs]) are present in soil and/or groundwater in the site vicinity which might pose a possible vapor intrusion into existing or future buildings at the site.

1.2 Involved Parties

Ms. Connie Lizarraga and Mr. Eric Patschull of Ardent conducted the historical research, site reconnaissance, regulatory inquiries, and document review. Mr. Paul Roberts completed oversight and management. Mr. Roberts, Mr. Patschull, and Ms. Lizarraga meet the definition of an environmental professional as set forth in the AAI Final Rule.

1.3 Scope of Work

Ardent's scope of work for this Phase I ESA is consistent with ASTM Standard E1527-13 and included the activities listed below.

- **Review of User Provided Information** – Review of information regarding title and judicial records for environmental liens or activity and use limitations, recorded environmental liens, actual or specialized knowledge or commonly known information regarding environmental conditions at the site, the relationship of the purchase price of the property to the fair market value, readily available maps, environmental reports, and other environmental documents pertaining to the site, as available and obtained from the user/client.
- **Records Review** – Acquisition and review of records, including federal, state, tribal, and local regulatory agency databases, for the site and for properties located within a speci-

fied radius of the site; local regulatory agency files for the site and selected nearby properties of potential environmental concern; physical setting sources, including topographic maps, geologic maps, and geologic and hydrogeologic reference documents; and historic land use information including aerial photographs, historical fire insurance rate maps, building department records, and city directories, as necessary, that are reasonably ascertainable, publicly available, can be obtained within reasonable time and cost, and are practically reviewable.

- **Vapor Encroachment Condition (VEC)** – Review available regulatory and client provided data to assess Tier 1 non-numeric screening for the site. Ardent evaluated whether contaminants were present in soil and/or groundwater in the site vicinity which might pose a VEC at the site.
- **Site Reconnaissance** – Performance of a site reconnaissance to visually observe the site and any structure(s) located on the site to the extent not obstructed by bodies of water, adjacent buildings, or other obstacles. The purpose of the site reconnaissance is to obtain information indicating the likelihood of identifying RECs in connection with the site, including the general site setting, site usage, use and storage of hazardous materials and petroleum products, disposal of waste products and materials, sources of polychlorinated biphenyls (PCBs), and evidence of releases and possible risks of contamination from activities at adjacent properties.
- **Interviews** – Interviews with site representatives, including owners, occupants, and site managers, regarding the environmental condition of the site to the extent necessary and such persons are available. Interviews with state and/or local government officials as necessary.
- **Report** – Evaluation of the information and data obtained by the Phase I ESA process outlined above and preparation of this Phase I ESA report documenting findings and providing opinions and conclusions regarding possible environmental impacts and RECs at the site.

1.4 Limitations and Exceptions

The environmental services described in this report have been conducted in general accordance with current regulatory guidelines and the standard-of-care exercised by environmental consultants performing similar work in the project area. No warranty, expressed or implied, is made regarding the professional opinions presented in this report.

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. Ardent should be contacted if the reader requires any additional information or has questions regarding the content, interpretations presented, or completeness of this document.

The findings, opinions, and conclusions are based on an analysis of the observed site conditions and the referenced literature. It should be understood that the conditions of a site could change with time as a result of natural processes or the activities of man at the subject property or nearby sites. In addition, changes to the applicable laws, regulations, codes, and standards of practice may occur due to government action or the broadening of knowledge. The findings of this report may, therefore, be invalidated over time, in part or in whole, by changes over which Ardent has no control. Ardent cannot warrant or guarantee that not finding indicators of any particular hazardous material means that this particular hazardous material or any other hazardous materials do not exist on the site. Additional research, including invasive testing, can reduce the uncertainty, but no techniques now commonly employed can eliminate the uncertainty altogether.

1.5 Special Terms and Conditions

As indicated in Section 13.1.5 of ASTM Standard E 1527-13, the following, which is not intended to be all inclusive, represents out-of-scope items with respect to a Phase I ESA: asbestos-containing building materials (ACMs), radon, lead-based paint (LBP), lead in drinking water, wetlands, regulatory compliance, cultural and historic risk, industrial hygiene, health and safety, ecological resources, endangered species, indoor air quality unrelated to releases of hazardous substances or petroleum products into the environment, biological agents, and mold. As part of our agreement with the client, Ardent visually assessed site buildings (if present) for possible ACMs, LBP, and mold. In addition, ASTM Standard E 2600-15 supplements the ASTM Standard E 1527-13 to include evaluation of VEC using Tier 1 screening.

This study did not include an evaluation of geotechnical conditions or potential geologic hazards. In addition, Ardent did not address interpretations of zoning regulations, building code requirements, or property title issues.

1.6 User Reliance

This report may be relied upon and is intended exclusively for use by the client, its partners, members, investors, affiliates, successors and assigns, and lenders. Any use or reuse of the findings, opinions, and/or conclusions of this report by parties other than the foregoing parties is undertaken at said parties' sole risk.

1.7 Physical Limitations

No physical limitations were encountered during the completion of this Phase I ESA report.

1.8 Data Gaps

No significant data gaps were noted during the preparation of this Phase I ESA report.

2 GENERAL SITE CHARACTERISTICS

The following sections describe the location and the current uses of the site and adjacent properties. A site location map is presented as Figure 1 and a site vicinity map is presented as Figure 2. Selected photographs of the site and surrounding properties are provided in Appendix A.

2.1 Location and Legal Description

The site is located in the city of Burbank, Los Angeles County, California (Figure 1). The site has been assigned the addresses of 2555, 2801, 2949, and 3001 North Hollywood Way and 3525 and 3615 North San Fernando Boulevard. The addresses of 2555, 2801, and 3001 North Hollywood Way were also assigned to portions of the larger property.

It should be noted that “North San Fernando Boulevard” is also referred to as “North San Fernando Road” on different maps and documents. Therefore, these street designations have been used interchangeably throughout this report.

The site is bounded as shown on Figure 2. The site has been assigned the Tax Assessor Parcel Numbers (APNs) of 2466-011-908, 2466-011-909-, 2466-011-911, 2466-028-907, 2466-028-908, and portions of 2466-011-910. A complete legal description is presented in the Preliminary Title Report provided in Appendix F. Site boundary information was obtained during the site reconnaissance and from information provided by the client.

2.2 Site Description and Current Site Uses/Operations

The following paragraphs present a description of the structures present at the site, the tenants currently occupying the site, the activities being conducted on-site, the heating and cooling systems utilized in the site building, the sewage disposal system, and the potable water provider for the site, if any.

2.2.1 Site Description

The subject site is an irregular shaped property that comprises approximately 60-acres. At the time of the site reconnaissance, the site was vacant land, with the exception of a portion of the northern side of the site which was used for truck parking and storage (Figure 2).

2.2.2 Occupants

The site buildings have been razed and the site is currently vacant land with the exception of a northern portion of the site. Affordable Storage located at 3615 North San Fernando Boulevard is used for truck parking and storage (Figure 2).

2.2.3 Heating and Cooling Systems

Future heating and cooling will likely be powered by electricity and/or natural gas provided by local municipalities.

2.2.4 Sewage Disposal/Septic Systems

Future sewage disposal will likely be provided by the city municipalities. There has been no indication that septic systems have been used at the site.

2.2.5 Potable Water

Potable water is provided to the site by the local water purveyor.

2.3 Adjacent Properties

In general, the site vicinity is used for commercial, office, and retail purposes. As noted above, the site was part of a larger property. The site is generally bounded to the north by San Fernando Road, to the south and west by Bob Hope Airport and to the east by Hollywood Way (Figure 2).

No evidence of aboveground storage tanks (ASTs), underground storage tanks (USTs) or other possible hazardous materials or wastes were noted being stored by off-site facilities along the site property line. These off site facilities would not be considered an environmental concern to the site.

3 USER PROVIDED INFORMATION

The following sections summarize information obtained by the user to assist the environmental professional in identifying the possibility of RECs in connection with the subject property, and to fulfill the user's responsibilities in accordance with Section 6 of ASTM Standard E 1527-13. A copy of the user questionnaire as completed by Mr. Michael Johnson of Overton Moore Properties is presented in Appendix B.

3.1 Current Title Information

A Preliminary Title Report provided by the client was reviewed by Ardent. The title report prepared by First American Title Company was dated November 2, 2015. According to the Preliminary Title Report, the current owner of the site is "The Bank of New York Trust Company, N.A., a national banking association, Trustee" A copy of the Preliminary Title Report is provided in Appendix F.

3.2 Environmental Liens or Activity and Use Limitations (AULs)

Mr. Johnson indicated that environmental liens or AULs against the subject property have been filed or recorded under federal, state, or local law. The OMP Purchase and Sale Agreement includes a deed restriction which restricts the site land use to commercial/industrial.

3.3 Specialized Knowledge

Mr. Johnson indicated that, for purposes of this assessment, the client has no specialized knowledge or experience pertaining to the site or the adjacent properties that is material to RECs in connection with the subject property.

3.4 Commonly Known or Reasonably Ascertainable Information

Mr. Johnson was aware of commonly known or reasonably ascertainable information pertaining to the site. Mr. Johnson referred to the previous environmental reports provided to Ardent for review.

3.5 Valuation Reduction for Environmental Issues

In a transaction involving the purchase of a parcel of commercial real estate, the user shall consider the relationship of the purchase price of the property to fair market value of the property if the property was not affected by hazardous substances or petroleum products. Mr. Johnson indicated the purchase price reflects fair market value.

3.6 Reason for Performing Phase I ESA

Ardent was retained to perform the Phase I ESA as part of the real estate due diligence as part of a possible purchase of the site.

3.7 Other User Provided Information

The client provided Ardent a number of environmental documents for review. Ardent also obtained copies of reports from regulatory agency files. The following presents a summary of our review. Figures 3 through 6 present site area designations and areas investigated, while Appendix C, D and E contain copies of pertinent information, key environmental reports and regulatory no further action (NFA) letters.

3.7.1 Historical Land Use

The site was used for agricultural purposes or vacant land from at least 1928 through the late-1930s. In the early-1940s, the Burbank Airport was constructed for use during World War II. Beginning in the early-1940s through the late-1990s, Lockheed used the site and site vicinity for aircraft research, manufacturing, warehouse, maintenance, and office purposes, mainly for the United States Department of Defense. This facility was known as "Plant B6" (Figure 2). In later years, the name of the airport was changed to Bob Hope Airport.

Site development included aircraft hangers, aircraft assembly and testing areas, maintenance areas, and office space. Operations at the Plant B6 included aircraft parking, final assembly and flight support, classified aircraft research and development, minor subassembly work, aircraft functional testing, and ground support. Supporting activities included cleaning and painting, minor tooling, welding, and parts and component machining. Chemicals and materials used and/or stored at the site to support these operations included aircraft fuels, biocides, descalers, fuel oils, gaso-

line, paints, solvents, acids, caustics, and plastic resins and hardeners. Fuels used at the site included automobile gasoline, aviation gasoline, Jet A, JP-4, JP-5, JP-7, JP-8, and other thermally stable jet fuels. Types of oils used included conventional motor oils, turbine lubricating oils, hydraulic system oils, and rust prevention oils. From 1941 to the late 1980s, approximately 65 buildings were constructed at the site (Figure 3).

In 1997 and 1998, most of the buildings, foundations, and pavement were demolished and removed from the site. The remaining on-site buildings were demolished in 2001.

As noted on Figure 2, a small swatch of land located in the mid-eastern portion of the site is not included as part of this assessment. This property was formerly known as the Pacific Airmotive property and was used for testing aircraft engines. Ardent recently completed a Phase I ESA for this property and is very familiar with the former property activities.

3.7.2 Historical Soil Investigations

The Site is located within the San Fernando Valley Groundwater Basin which has been designated by EPA as a Federal Superfund Site due to groundwater contamination associated with historical industrial land uses (Figure 5). The areas of groundwater contamination, designated as “Operable Units,” contain chemicals such as volatile organic compounds (VOCs), namely trichloroethene (TCE) and tetrachloroethylene (PCE), and other chemicals such as hexavalent chromium and 1,4-dioxane. The site lies within the “Burbank Operable Unit.” A number of investigations have been completed over the years, and based on the results, Lockheed has been named as one of many potentially responsible parties (PRPs) for contributing to the groundwater issues. Groundwater investigations completed at the site have shown elevated concentrations of PCE, TCE, and hexavalent chromium. Groundwater has been measured at the site at depths of approximately 220 feet below the ground surface (bgs) and flows in a southeasterly direction.

Since the early-1990s, the site has been investigated by the Regional Water Quality Control Board, Los Angeles Region (RWQCB) under its Well Investigation Program

(WIP) as part of the San Fernando Valley Groundwater Basin Superfund Site. Over the years, a number of investigations have been completed including the collection and analyses of soil, soil gas, and groundwater samples. Work has been completed under the direction and oversight of the RWQCB and Federal EPA

The earlier investigations and soil remediation were completed throughout the larger property with little documentation as to the location of these actions. Therefore, it was very difficult to determine whether these investigations were completed on- or off-site. Pertinent environmental information and key environmental reports are provided in Appendix C and D.

In 1991, McLaren Hart completed an in-depth environmental assessment of the site which presented a comprehensive study of the historical land use, operations at Plant B6, and areas of concern. Based on the results of this investigation, McLaren Hart identified a number of areas of concern (AOC) including underground storage tanks (USTs), aboveground storage tanks (ASTs), sumps, clarifiers, surface stains, process lines, degreasers, trenches and floor drains, and chemical storage and handling areas. This report refers to the site as "Parcel 2" of Plant B6. This report also refers to areas of concern relative to building numbers formerly associated with the larger property. According to McLaren Hart, 25 fuel USTs and 10 non-fuel USTs, sumps, and clarifiers were located throughout Parcel 2. According to McLaren Hart, some were removed and others were abandoned in-place.

From 1992 through 1996, Tetra Tech completed a number of soil gas investigations, soil sampling, and soil remediation on behalf of Lockheed to address the AOCs outlined by McLaren Hart. Based on the results of these investigations and remedial efforts, the RWQCB issued a number of NFA letters for particular areas of the site, stating that there was a low likelihood that the residual contaminants continue to contribute to the regional groundwater issue.

ENSR also completed independent assessments of the site and surrounding properties from 1996 through 1998 on behalf of the Airport Authority. ENSR also collected soil vapor and discrete soil analytical data. In 2001, ENSR completed an environmental summary which outlined the results of the previous investigations and

presented the subsequent NFA letters issued by the RWQCB for the larger property. At the time of the ENSR report, three additional reports had been recently submitted to the RWQCB and agency response had not yet been obtained. These included two reports by KW Brown & Associates, Inc. dated 1998 and 1999, and a 2001 investigation report by ENSR assessing thallium and chromium concentrations in soil samples at the site. The environmental summary report also presented the results of the soil and soil gas sampling completed throughout the site by Tetra Tech and ENSR. Based on these data, elevated concentrations of total VOCs, in the 100s of micrograms per liter, have been detected throughout the site. This report also indicated that Transite piping was known to exist beneath the site. No recommendations were provided in this report.

In the 2000s, groundwater samples from drinking water wells in the San Fernando Groundwater Basin began detecting emergent chemicals, including hexavalent chromium, 1,4-dioxane, and others. In 2013, the RWQCB issued a letter to Lockheed requesting soil sampling be completed in selected areas of the site for hexavalent chromium. The letter specifically outlined areas of the site and surrounding properties where soil sampling was to be conducted. Tetra Tech subsequently completed the work requested by the RWQCB and presented its results in a report dated December 2014. Tetra Tech designated the on-site AOCs as AOC 13, 14, 15, 16, 17, 18, and 19 (Figure 5). Laboratory results indicated no detectable to low concentrations of hexavalent chromium in soil samples analyzed. Based on these results, Tetra Tech concluded that these AOCs did not pose a significant source of hexavalent chromium to groundwater. The RWQCB concurred with these conclusions in a letter dated August 4, 2015. However, because other off-site AOCs still need further evaluation, the RWQCB has not issued a NFA letter for the site. This case is considered open with the RWQCB.

3.7.3 Evaluation of Historical Soil Investigations and Residual Contaminants

Ardent reviewed RWQCB records, which consisted of numerous boxes containing files for many Lockheed properties in the site vicinity, including the site and larger property. Based on our review, Ardent found numerous reports, which correlated to the NFA letters issued to the site. Based on our review and the fact that the site was

part of a larger facility, it was difficult to determine whether all of the reported underground features had been properly removed from the site. In 1998, a geophysical survey was completed throughout the site to address these unknowns. ENSR retained GeoVision to complete the geophysical survey to screen the site for metallic pipes, utility cables, large USTs (greater than 1,000-gallons), and other large buried metallic objects over most of the site. Based on the findings presented in the report, no large USTs (greater than 1,000-gallons) were identified in the area surveyed. Since the site was only screened for metallic objects, the extent of Transite piping was not further evaluated. Based on this information, it appears that the reported USTs and unknown underground features have been removed. It should be noted that a 509,000-gallon underground water reservoir is still apparently located at the site. The reservoir is reportedly located beneath former Building 333 in the mid-eastern portion of the site. The geophysical survey completed by GeoVision did not include this area. This feature would not be considered an environmental concern to the site.

In the 1990s, residual contaminants to be left in-place were evaluated by regulatory agencies based on the likelihood of migration to groundwater (i.e. for the protection of groundwater); with a lesser extent for the protection of human health. By the mid-2000s, agencies began evaluating in-place contaminants for the protection of groundwater and human health. Ardent completed a cursory evaluation of the chemical data of the residual contaminants that were allowed to be left in-place by the RWQCB in 1996. Ardent reviewed these data based on current regulatory guidelines based on human health risk criteria (i.e. Federal EPA Regional Screening Levels for industrial/commercial land use [RSLi] and Department of Toxic Substances Control Screening Levels for industrial/commercial land use [DTSC-SLi]). Based on our review, there is a low likelihood that the residual contaminants would pose a human health risk through dermal contact.

During completion of the earlier studies, soil gas investigations were completed as a screening tool to assess possible source areas of VOCs, and therefore, higher chemical detection limits were used. Current studies, used to evaluate human health risks, use much lower detection limits. Based on our evaluation of these historical da-

ta with respect to current human health risk guidelines, there is a high likelihood that residual contaminants could pose a potential threat to human health to future occupants through vapor intrusion.

3.7.4 Groundwater Investigations

As stated above, the site lies within the San Fernando Valley Groundwater Basin Superfund Site and Lockheed has been named as a RP to the regional VOC groundwater issue (Figure 6). Groundwater investigations have been ongoing at the Plant B6 property and other Lockheed facilities in the Burbank area since 1986. These earlier investigations were completed to assess the extent of VOC-impacted groundwater. In later years, emergent chemicals, including hexavalent chromium, were detected in drinking water wells. Based on this information, additional soil investigations were required to further assess possible source areas of these chemicals.

Currently, there are three groundwater monitoring wells located on the site (Figure 5). Lockheed conducts groundwater monitoring of these and other wells in the site vicinity on an annual basis. Most recently, groundwater has been measured at depths of approximately 220 feet bgs and flows in a southeasterly direction. Laboratory results have indicated elevated concentrations of VOCs, namely PCE, TCE, and hexavalent chromium in groundwater beneath the site. Work has been completed in general accordance with RWQCB Cleanup and Abatement Order No. 87-161 dated December 1987.

3.7.5 Ardent's Summary of Review

Based on review of available documents, Ardent presents the following summary.

- The site was investigated in the early- to mid-1990s for possible VOCs source areas as part of the RWQCB WIP associated with the San Fernando Valley Groundwater Basin Superfund Site. Although Lockheed has been designated as a PRP for contributing VOCs to groundwater as part of its former regional operations, investigations completed on-site did not show a significant risk of VOCs to groundwater. Based on these investigations and subsequent soil remediation, the RWQCB has issued NFA letters for soil only.

- The VOC soil investigations were completed to assess whether a threat to groundwater existed. Since completion of this work, agencies typically require investigation efforts to also address possible human health risks (i.e. through dermal contact and vapor intrusion). Based on the results of soil and soil gas samples collected in the mid- to late-1990s, the residual contaminants do not apparently present a human health risk through dermal contact, however, a vapor intrusion issue may be present at the site.
- Based on the results of the subsurface investigations and subsequent geophysical survey, no USTs or other unknown subsurface features appear to be located at the site. A large underground water reservoir is apparently still present in the mid-eastern portion of the site in the vicinity of former Building 333.
- In 2013, additional soil investigations were completed to assess whether the site had contributed to the regional hexavalent chromium issue in groundwater. Laboratory results of soil samples collected throughout the site have shown low concentrations of hexavalent chromium. Based on this information, the RWQCB has concluded that there is a low likelihood that the site has contributed to the chromium issue. Because additional investigations are needed at other Lockheed properties in the site vicinity, this case is still considered open with the RWQCB.
- Three groundwater monitoring wells are located on-site and are part of a larger groundwater monitoring program currently being completed by Lockheed on an annual basis.
- Asbestos-containing Transite piping is reportedly located beneath the site; the extent of which is unknown.

4 PHYSICAL SETTING

The following sections include discussions of topographic, geologic, and hydrogeologic conditions in the vicinity of the site, based upon our document review and our visual reconnaissance of the site and adjacent areas.

4.1 Site Topography

Based on the review of the United States Geological Survey (USGS) 7.5 Minute Series, Burbank, California, Topographic Quadrangle Map dated 1994, photorevised from 1966, the site has an approximate elevation of 715 feet above mean sea level (msl) and slopes to the southeast.

4.2 Geology

The site is located in the western portion of the Transverse Range Geomorphic Province, on the northwestern structural block of the Los Angeles basin. The Verdugo Mountains, a surface expression of the Verdugo Faults within the San Fernando Valley, are located approximately one-mile northeast of the site. The San Fernando Valley contains up to 2,000 feet of alluvial sediments resting on mid-Tertiary marine sedimentary beds and volcanics. The site is underlain by Quaternary age sand and gravels derived from crystalline and sedimentary rocks in the surrounding mountains.

4.3 Oil and Gas Maps

Based on a review of the Division of Oil, Gas, and Geothermal Resources (DOGGR) on-line well finder the site does not lie in an active oil field and no oil wells have been drilled on the site or in the immediate site vicinity.

4.4 Site Hydrology

The following sections discuss the site hydrology in terms of both surface waters and groundwater.

4.4.1 Surface Waters

No natural surface water bodies, including ponds, streams, or other bodies of water are present on or adjacent to the site.

4.4.2 Groundwater

As noted above, the site is located within the San Fernando Valley Groundwater Basin which has been designated by EPA as a Federal Superfund Site due to groundwater contamination associated with historical industrial land uses. The areas of groundwater contamination, designated as "Operable Units," contain chemicals such as VOCs, namely TCE and PCE, and other chemicals such as hexavalent chromium and 1,4-dioxane. The site lies within the "Burbank Operable Unit." A number of investigations have been completed over the years, and based on the results, Lockheed has been named as one of many PRPs for contributing to the groundwater issues. Groundwater investigations completed at the site have shown elevated concentrations of PCE, TCE, total chromium and hexavalent chromium.

Currently, there are three groundwater monitoring wells located on-site, designated B-6-CW06, B-6-CW09, and B-6-CW10 (Figure 3). These wells are part of a larger groundwater monitoring program that includes additional off-site wells. These wells are monitored by Lockheed on an annual basis. Groundwater has been measured at a depth of approximately 220 feet bgs and flows in a southeasterly direction.

Because these wells are part of a regional Superfund Site, if these wells are required to be moved or modified during redevelopment activities, authorization must be obtained from the EPA before abandonment/modification can be completed. Typically, the well owner/operator would obtain EPA approval.

5 HISTORICAL LAND USE

Ardent conducted a historical record search for both the site and surrounding areas. This included a review of one or more of the following sources that were found to be both reasonably ascertainable and useful for the purposes of this Phase I ESA: historical aerial photographs, historical fire insurance maps, historical city directories, building permits and plans, topographic maps, property tax records, zoning/land use records, and a review of prior environmental assessment reports regarding the site. Copies of historical land use information are provided in Appendix F.

5.1 Summary of Historical Land Use of the Property

The site was used for agricultural purposes or vacant land from at least 1928 through the late-1930s. From at least 1944 through the 1990s, the site was used for aircraft research, manufacturing, warehouse, maintenance, and office purposes. The site buildings were razed from 1997 through 2001. The site is currently vacant land, with the exception of a small portion of the northern property which is used by a company for long-term storage of automobiles and miscellaneous personal items in storage pods.

5.2 Summary of Historical Land Use of Adjoining Properties

The site vicinity was used for agricultural purposes, vacant land, and some residential purposes from at least 1928 through the late-1930s. By the early-1940s, properties in the site vicinity started to be developed for commercial, industrial, and some residential purposes.

5.3 Historical Aerial Photographs

Historical aerial photographs for selected years between 1928 and 2012 were provided by EDR. The following presents a summary of our review.

- **1928 and 1938** – The site and properties in the site vicinity appeared to be used for agricultural purposes or vacant land. The northern portion of the site appeared to be developed with residential structures. The Southern Pacific Railroad spurs were noted north of the site.
- **1952, 1954, 1964, 1977, 1981, 1989, and 1994** – The site appeared to be developed as part of the larger property with various commercial buildings. In the 1952, 1954, and 1964 photographs, the eastern and southern portions of the site appeared to be used to park small aircrafts. Adjacent properties west and south of the site were developed as part of the Bob Hope Airport.
- **2002, 2005, 2009, 2010, and 2012** – The site appeared to be vacant land. Portions of the northern portion of the site appeared to be used as a parking lot.

5.4 Building Permits

Building permits for the site are issued and maintained at by the City of Burbank Building Department (BBD). Building permits for the addresses of 2555, 2801, 2949, and 3001 North Hollywood Way were found. The following presents a summary of the permits reviewed.

- **2555 North Hollywood Way:** Building permits associated with this address not only contained information associated with the larger property but it appears that this address was also recently assigned to a new shopping center development located further south of the site. The building permits associated with the new development were dated 2012 through 2014. Building permits associated with the site and larger property were dated 1969 through 1997 and included building repairs, alterations, electrical, plumbing, fire sprinklers, mechanical, and foundation repair. The permits reviewed were issued to Lockheed. A certificate of occupancy issued to owner Lockheed California Company for a re-located office building was dated February 28, 1978. A grading permit dated November 10, 1999 was issued to Lockheed for the “exploratory excavation to evaluate the lateral extent of chemicals in soil.” The permit was issued to contractor Tetra Tech.
- **2801 North Hollywood Way:** Building permits associated with this address also contained information associated with the larger property. Building permits associated with the site and larger properties were dated 1944 through 1997 and included building repairs, alterations, electrical, plumbing, fire sprinklers, mechanical, and heating and ventilation. The permits reviewed were issued to Lockheed. Building permits dated May 29, 1944 were for the construction of an aircraft assembly building. The owner listed was Lockheed Aircraft Corporation. Building permits dated 1996 through 1999 were for the demolition of buildings.

- **2949 North Hollywood Way:** A permit dated July 16, 2014 was for the installation of a temporary power pole. The permit was issued to owner “Arman Naringan.” A letter from the city of Burbank dated September 10, 1975 indicates that Lockheed Building No. 326 was issued the address of 2949 North Hollywood Way.
- **3001 North Hollywood Way:** A permit dated July 16, 2014 was for the installation of a temporary power pole. The permit was issued to owner “Arman Naringan.”

5.5 Historical Topographic Maps

Historical topographic maps were provided by EDR for review. The maps were dated 1896, 1900, 1901, 1902, 1920, 1926, 1953, 1966, 1972, and 1994. The 1896, 1900, 1901, 1902, 1920, and 1926 maps did not show site specific details. In the 1953 map, the central and southern portions of the site were developed with at least ten commercial structures while the northern side of the site was developed with various smaller structures along North San Fernando Boulevard. In the 1966, 1972, and 1994 maps the former site buildings were noted. Properties in the surrounding vicinity, further north, south, and east of the site were shaded pink indicating these areas was urban development.

5.6 Interviews

Interviews were conducted by Ardent with key site personnel (e.g., past and present owners, operators, and/or occupants) with the objective of obtaining information indicating RECs in connection with the subject property. The following are the site personnel interviewed for purposes of this assessment.

5.6.1 Interview with Owner

The owner of the site was not available for an interview.

5.6.2 Interview with Site Manager

The site manager was not available for an interview.

5.6.3 Interviews with Occupant

The majority of the site was vacant land at the time of the site reconnaissance, therefore no occupants were present.

5.6.4 Interviews with Local Government Officials

Representatives of local regulatory agencies were interviewed during completion of this report. The information obtained is presented throughout this report.

5.6.5 Interviews with Others

A Burbank Airport Authority Police officer escorted Ardent personnel during its site reconnaissance. Ardent interviewed the officer during the site reconnaissance. No other interviews were conducted during this Phase I ESA.

5.7 Previous Reports and Documents

As discussed in Section 3.7, previous environmental reports were provided to Ardent for review.

6 SITE RECONNAISSANCE

The site and site vicinity reconnaissance was performed by Ardent on November 10, 2015. The site reconnaissance involved a walking tour of the site and visual observations of adjoining properties. At the time of the site reconnaissance, the weather was clear and sunny. Selected photographs taken during these activities are included in Appendix A.

At the time of the site reconnaissance, most of the site was vacant land, except for a northern portion of the site located at 3615 North San Fernando Boulevard, which was occupied by Affordable Storage, a truck parking lot and storage facility. The Affordable Storage facility was used to store vehicles and trucks for long term purposes, and also used storage pods to store miscellaneous personnel items. No vehicle maintenance was noted.

6.1 Use and Storage of Hazardous Substances and Petroleum Products

The use and storage of hazardous substances and petroleum products was not observed during the site reconnaissance.

6.2 Storage and Disposal of Hazardous Wastes

The storage and disposal of hazardous wastes was not observed at the time of the site reconnaissance.

6.3 Unidentified Substance Containers

No unidentified substance containers were observed on site during the site reconnaissance.

6.4 Aboveground Storage Tanks (ASTs) and Underground Storage Tanks (USTs)

During the site reconnaissance, Ardent observed an approximately 100 to 150-gallon AST located within a concrete lined basement enclosure. The basement was approximately 10 to 15 feet deep. Based on representatives at the Airport Authority, the basement enclosure was formerly associated with a Pump House that was located beneath former Building 339 and was connected to the 509,000-gallon water reservoir which was located beneath former Building 333. The AST located within the basement possibly contained fuels for the water pump. No evidence of leaks or stains were observed. These features would not be considered an environmental concern to the site.

6.5 Evidence of Releases

Evidence of chemical releases on the site, such as odors, stressed vegetation, stains, leaks, pools of liquids, and spills, was not observed during the site reconnaissance.

6.6 Polychlorinated Biphenyls (PCBs)

Historically, PCBs (a group of hazardous substances and suspected human carcinogens) were widely used as an additive in cooling oils for electrical components. Typical sources of PCBs can include electrical transformers. No electrical transformers were noted on the site.

6.7 Suspect Asbestos-Containing Building Materials (ACMs)

The manufacture of most ACMs in the United States was phased out in the 1970s, ending in 1980. Previously manufactured ACMs that were in stock continued to be used through approximately 1981. Some non-friable ACMs are still manufactured (e.g. roofing mastics). In general, buildings constructed after 1981 have a negligible potential to contain friable ACMs and a low potential for most non-friable ACMs, with the exception of roofing materials. Since the site is currently vacant, the presence of ACMs is not likely. However, as noted in Section 3.7, previous investigations indicated that there were known asbestos-containing Transite piping located beneath the site.

6.8 Lead Based Paint (LBP)

The manufacture of LBP was phased out in approximately 1978. The site is currently vacant land, therefore LBP is not likely present.

6.9 Indications of Water Damage or Mold Growth

Since no structures are present on-site, no visual indications of water damage or mold growth were observed at the site during the site reconnaissance.

6.10 Wastewater Systems

No wastewater systems were observed during the site reconnaissance.

6.11 Stormwater Systems

Storm drains were noted throughout the site (in paved areas). No other stormwater systems were noted during the site reconnaissance.

6.12 Wells

One on-site monitoring well (B-6-CW06) was observed on the northeastern side of the property within a parking lot area (3525 North San Fernando Boulevard). The groundwater monitoring well consisted of three well boxes, indicating the well was perforated at different zones. According to reports reviewed, up to three groundwater monitoring wells are located on the site in the locations shown on Figure 3.

6.13 Other Subsurface Structures

Ardent also observed a vent pipe along the access road, in the general vicinity of the water reservoir. Although the use of the vent pipe is unknown, based on the location with respect to the 509,000-gallon water reservoir, it is our assumption that this vent pipe is associated with this feature. . This feature, therefore, would not be considered an environmental concern to the site.

No other subsurface structures (e.g., sumps, vaults, oil/water separators, and other surface impoundments) were noted during the site reconnaissance.

6.14 Other Issues

No other on- or off-site issues of environmental concern were noted.

7 ENVIRONMENTAL DATABASE SEARCH

A computerized environmental information database search was performed by EDR for this Phase I ESA on November 4, 2015. The database search included federal, state, local, and tribal databases. A summary of the environmental databases searched, their corresponding search radii, and number of noted facilities of environmental concern is presented in Appendix G. In addition, a description of the assumptions and approach to the database search is provided in Appendix G. The review was conducted to evaluate whether the site or properties within the vicinity of the site have been reported as having experienced significant unauthorized releases of hazardous substances or other events with potentially adverse environmental effects.

Five unmapped properties, due to poor or inadequate address information, were identified in the database report. Two of these listings, the San Fernando Valley Groundwater Basin and Pacific Airmotive Corporation, have been identified and are discussed below. Based on the information provided for the remaining properties, and/or the types of databases on which the properties are listed, there is a low likelihood that the environmental integrity of the site has been adversely impacted by these off-site sources.

The following paragraphs describe the databases that contain noted properties of environmental concern, and include a discussion of the regulatory status of the facilities and potential environmental impact to the subject site.

As previously discussed, the site was assigned the addresses of 2555, 2801, 2949, and 3001 North Hollywood Way and 3525 and 3615 North San Fernando Boulevard. The addresses of 2555, 2801, and 3001 North Hollywood Way were also assigned to portions of the larger property. The site was listed on numerous databases listed below, however Ardent could not identify whether the listings were associated with the site or the larger property.

7.1 Federal National Priorities List (NPL): Distance Searched – 1 mile

The NPL is the USEPA's database of uncontrolled or abandoned hazardous waste properties identified for priority remedial actions under the Superfund program. This database includes proposed NPL listings.

The site address is not noted on the EDR report as part of the NPL. The site lies within the San Fernando Valley Groundwater Basin. Portions of the San Fernando Groundwater Basin have been impacted with chlorinated solvents due to historical industrial activities. The site lies within the Burbank Operable Unit of the San Fernando Valley Groundwater Basin.

A Cleanup and Abatement Order was issued in 1987 to the responsible parties of the site and larger property. The responsible parties included Lockheed. The Cleanup and Abatement Order was issued by the RWQCB on behalf of the EPA to cleanup and abate VOC-contamination of soil and groundwater associated with the EPA San Fernando Valley Superfund Site. Lockheed has retained liability of the groundwater responsibilities.

7.2 Federal Delisted NPL: Distance Searched – 0.5 mile

This database contains delisted NPL properties under the Superfund program. The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the USEPA uses to delete properties from the NPL. In accordance with 40 Code of Federal Regulations (CFR) 300.425. (e), properties may be deleted from the NPL where no further response is appropriate.

Neither the site nor properties located within a 0.5-mile radius from the site were listed on this database.

7.3 Federal Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) List: Distance Searched – 0.5 mile

The CERCLIS database contains properties which are either proposed or on the NPL and properties which are in the screening and assessment phase for possible inclusion on the NPL. This database also includes properties listed as No Further Remedial Action Planned (NFRAP).

Although a specific site address was not listed, as noted above, the site and larger property have been listed as a responsible party to the San Fernando Valley Groundwater Basin Superfund Site. Portions of the San Fernando Valley Groundwater Basin are listed on the CERCLIS database.

Five other facilities located hydraulically cross- and downgradient from the site were listed on the database as NFRAP.

7.4 Federal Corrective Action Report (CORRACTS): Distance Searched – 1 mile

The USEPA maintains this database of Resource Conservation and Recovery Act (RCRA) facilities that are undergoing corrective action. A corrective action order is issued when there has been a release of hazardous waste or constituents into the environment from a RCRA facility.

The site was not listed on this database. One facility located approximately 0.37-mile east to southeast of and cross- to downgradient from the site was listed. Based on the distance and direction of this facility from the site, and depth to groundwater, this facility would not be considered an environmental concern to the site.

7.5 Federal Resource Conservation and Recovery Act (RCRA) Treatment, Storage, and Disposal (TSD) Facilities List: Distance Searched – 0.5 mile

The RCRA TSD database (non-CORRACTS) is a compilation by the EPA of facilities that report generation, storage, transportation, treatment, or disposal of hazardous waste.

The site was not listed on this database. One facility located approximately 0.37-mile east to southeast of and cross- to downgradient from the site was listed. Based on the distance and direction of this facility from the site, and depth to groundwater, this facility would not be considered an environmental concern to the site.

7.6 Federal RCRA Generators List: Distance Searched – Site and Adjoining Properties

This list identifies sites that generate hazardous waste as defined by RCRA. Inclusion on this list is for permitting purposes and is not indicative of a release.

The site was not listed on this database. Adjoining property listed as “UNC Pacific Airmotive” at 3003 North Hollywood Way as a large generator of hazardous waste. No violations were noted. Listing on this database is not indicative of a release.

7.7 Federal Institutional Control/Engineering Control Registries: Distance Searched – Site

These lists identify properties with engineering and/or institutional controls. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or affect human health. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on the site. Deed restrictions are generally required as part of the institutional controls.

Although the site is not listed, the San Fernando Valley Groundwater Basin is listed on these databases. Lockheed has been identified as a RP.

7.8 Federal Emergency Response Notification System (ERNS) List: Distance Searched – Site

The ERNS database, maintained by the USEPA, contains information on reported releases of oil and hazardous substances.

Site was not listed on this database.

7.9 Federal Brownfield List: Distance Searched – 0.5 mile

The USEPA Brownfield database, entitled Targeted Brownfield’s Assessments (TBA), lists properties for which the USEPA is providing funding and/or technical support for environmental assessments and investigations. The objective of the TBA is to promote cleanup and redevelopment of undesirable properties with environmental issues.

Neither the site nor properties located within a 0.5-mile radius from the site were listed on this database.

7.10 State Calsites Database (Calsites) or State-Equivalent CERCLIS: Distance Searched – 1 mile

The Calsites database, also known as the State-equivalent CERCLIS, is maintained by the Cal-EPA DTSC. This database contains information on AWP and both known and potentially contaminated properties. Two-thirds of these properties have been classified, based on available information, as needing no further action (NFA) by the Department of Toxic Substances Control (DTSC). The remaining properties are in various stages of review and remediation to determine if a problem exists. These properties are presented by EDR on the EnviroStor databases.

The site was listed on this database under the address of 2555 North Hollywood Way. The site was listed due to the groundwater issues previously discussed in Section 3.7.

Sixteen additional facilities were listed; three of which were listed with a regulatory status of closed case. The remaining thirteen facilities were located between approximately 0.002-mile and 0.90-mile hydraulically down- to crossgradient from the site. Based on the distance, direction, depth to groundwater, and/or regulatory status, these facilities would not be considered an environmental concern.

7.11 State Solid Waste Landfill Sites (SWLF): Distance Searched – 0.5 mile

The SWLF database consists of open and closed solid waste disposal facilities and transfer stations. The data comes from the Integrated Waste Management Board's Solid Waste Information System (SWIS) and the SWRCB Waste Management Unit Database (WMUD) database.

Neither the site nor properties located within a 0.5-mile radius from the site were listed on this database.

7.12 State Leaking Underground Storage Tank (LUST) Lists: Distance Searched – 0.5 mile

The LUST information system is obtained from by the SWRCB and the RWQCB (Regional Water Quality Control Board).

The site was not listed on this database. Nineteen facilities were listed on this database within the search radius. Seventeen of the nineteen facilities listed had a regulatory status of “case closed.” The remaining two facilities were located hydraulically down- and crossgradient, approximately 0.002-mile east and 0.34-mile southeast of the site. Based on the distance, direction, depth to groundwater, and/or regulatory status, these facilities would not be considered an environmental concern to the site.

7.13 State Underground Storage Tank (UST) and Aboveground Storage Tank (AST) Registration List: Distance Searched – Site and Adjoining Properties

UST and AST databases are provided by the SWRCB. Inclusion on these lists is for permitting purposes and is not indicative of a release.

The site and adjoining properties were not listed on the AST databases. The site was listed on the Statewide Environmental Evaluation and Planning System (SWEEPS) database, as Lockheed Plant B6 at 2801 North Hollywood Way. The listing indicated USTs varying in size from 1,500-gallon to 15,000-gallon containing diesel fuel, jet fuel, and water/oil were located at the site. Based on a review of regulatory records, these USTs were formerly located on the larger property.

7.14 State Voluntary Cleanup Programs (VCPs): Distance Searched – 0.5 mile

The State VCP database lists low threat level properties with either confirmed or unconfirmed releases. Project proponents have requested that the DTSC oversee investigation and/or cleanup activities and have agreed to provide coverage for DTSC’s costs.

Neither the site nor facilities located within the search radius were listed on this database.

7.15 Indian Reservations: Distance Searched – 1 mile

This list depicts Indian administered lands of the United States that have an area equal to or greater than 640-acres. No Indian Reservations were listed within a 1-mile radius from the site. Due to the lack of Indian Reservations within 1-mile of the site, other tribal database listings required by ASTM and AAI were deemed not applicable. These listings would include tribal-equivalent NPL, CERCLIS, Landfill and/or Solid Waste Disposal, LUST, UST and AST Registrations, Institutional Control/Engineering Control Registries, VCPs, and Brownfields.

7.16 Other Non-ASTM and AAI Database: Distance Searched – Site

Other databases were included in the EDR Report, but are not required by ASTM or AAI. Based on our review of these databases, the site was listed on the following databases.

7.16.1 Facility Index System Identification Program Summary Report (FINDS)

The FINDS database contains information obtained from other regulatory databases. The FINDS database is maintained by EPA.

Although the site is not listed, the San Fernando Valley Groundwater Basin is listed on these databases. Lockheed has been identified as a RP.

7.16.2 Historical Hazardous Waste and Substances Sites List (HIST CORTESE)

The HIST CORTESE database contains information obtained from other the regulatory databases.

The site and larger property were listed as “Lockheed Plant B-6” at 2801 North Hollywood Way due to its listing on other regulator databases.

7.16.3 California Bond Expenditure Plan (CA BOND EXP. PLAN)

This database contains information obtained from the RWQCB.

The site and larger property were listed under the address of 2555 North Hollywood Way under the name “Lockheed-Burbank Plants A-1, B-1, B-6, and C-1.” As previously discussed, the site has been named a RP for the San Fernando Groundwater Basin Superfund Area 1. The listing indicates the PRP will be providing costs for remediation of the site cleanup under the oversight of the RWQCB.

8 VAPOR ENCROACHMENT CONDITION (VEC)

Ardent completed a VEC study for the site using Tier 1 criteria as recommended by ASTM E 2600-15. The Tier 1 screening identifies surrounding facilities that pose a possible vapor intrusion source to the site based on the results of the Phase I ESA investigations and certain criteria outlined by ASTM. These criteria include a certain distance from the target site (referred to by ASTM as within the “area of concern”); the types of chemicals used (referred to by ASTM

as the “chemicals of concern”); and a plume test to determine if the plume associated with a source of contamination is close enough to the site to impact indoor air quality. Based on our review of regulatory records, files, databases, client furnished data, and site reconnaissance activities, the site would be considered a possible risk for vapor intrusion.

As discussed in Section 3.7, soil vapor samples collected in the mid-1990s have shown elevated concentrations of PCE exceeding screening levels. Based on this information, a current soil gas survey should be completed to obtain recent data. The laboratory results should be evaluation to assess whether engineering controls in new buildings are necessary.

9 REGULATORY RECORDS REVIEW

The South Coast Air Quality Management District (SCAQMD), RWQCB, Los Angeles County Department of Public Health, Environmental Programs (LACDPH), Los Angeles County Department of Public Works (LACDPW), the Department of Toxic Substances Control (DTSC), the City of Burbank Fire Department (BFD) are the lead regulatory agencies for permitting and regulating USTs, ASTs, LUST cases, and/or facilities that use, store, or generate hazardous waste or hazardous materials. Ardent requested file reviews using the site addresses of 2801, 2949, and 3001 North Hollywood Way and 3525 and 3615 North San Fernando Boulevard.

9.1 South Coast Air Quality Management District (SCAQMD)

Records regarding the site were reviewed using the SCAQMD FIND website. The site address of 2801 and 2555 North Hollywood Way was listed. The site was listed under the following Facility Names and ID's:

- Lockheed Advanced Dev Co (2801 North Hollywood Way) was listed under Facility ID 67709 with an “active” facility status. The facility was listed under the description of “transportation equipment and sales.” One permit dated July 6, 1989 was issued for the operation of a drying oven. Two violations dated July 11, 1989 and August 8, 1989 for not having a proper permit for the use of a spray booth. Both violations were reportedly corrected on February 28, 1990.
- Lockheed Advanced Dev Co (2801 North Hollywood Way) was listed under Facility ID 67389 with a facility status of “out of business.” The facility was listed under the description of “transportation equipment and sales.” No equipment permits, notices of violations or notices of compliance were listed.

- Lockheed Advanced Dev Co (2801 North Hollywood Way) was listed under Facility ID 67834 with a facility status of “out of business.” The facility was listed under the description of “transportation equipment and sales.” No equipment permits, notices of violations or notices of compliance were listed.
- Lockheed Air Terminal Inc. (2801 North Hollywood Way) was listed under Facility ID 85109 with a facility status of “out of business.” No equipment permits, notices of violations or notices of compliance were listed.

9.2 Regional Water Quality Control Board, Los Angeles Region (RWQCB)

Ardent searched the SWQCB GeoTracker website for possible files at the RWQCB regarding the site. According to GeoTracker, the site address of 2801 North Hollywood Way was listed on this database as “Lockheed Plant B-6” a closed leaking underground storage tank (LUST) case as of October 30, 1996. The GeoTracker database, however, had no additional information regarding the case.

The site address of 2555 North Hollywood Way was also listed on this database as “Lockheed Plant A-1” and “Lockheed Plant A-1-F” as closed LUST cases as of May 1, 1994. Additional information regarding the listings was not provided on the GeoTracker database. Based on the title of the listings (Lockheed Plant A-1 and Lockheed Plant A-1-F), these listings are likely associated with the larger property and not the site.

Ardent also requested records regarding the site from the RWQCB. The RWQCB files consisted of numerous boxes containing files for many Lockheed properties in the site vicinity, including the site. Ardent obtained copies of the earlier subsurface investigation reports completed by Tetra Tech as part of the soil closure activities. These reports were reviewed and summarized in Section 3.7.

9.3 Los Angeles County Department of Public Works (LACDPW)

Records regarding the site were requested from the LACDPW. According to the LACDPW, records regarding properties in Burbank were forwarded to the City of Burbank Fire Department (BFD).

9.4 Los Angeles County Department of Public Health (LACDPH)

Records regarding the site were requested from the LACDPH. According to the LACDPH, no records regarding the site were found.

9.5 City of Burbank Fire Department (BFD)

The BFD is the lead regulatory agency for UST and industrial waste closure activities. Records regarding the site were requested from the BFD. Records regarding the site addresses of 2555, 2801, and 3001 North Hollywood Way and 3615 North San Fernando Road were found. The following presents a summary of these records.

- **2555 North Hollywood Way:** Records associated with this address included both the site and larger property. Most of the records associated with this address were not regarding the site. Records regarding the site included a permit dated June 20, 1972 to install a 12,000-gallon liquefied petroleum gas UST west of Building 322 within Plant B-6. A permit dated April 20, 1994 was issued to remove “8” USTs from the “Lockheed Facility.”
- **2801 North Hollywood Way:** Most of the records associated with this address were regarding the removal, remediation, and closure of seven USTs located within the larger property (northwest of the site). No records regarding the site were noted.
- **3001 North Hollywood Way:** Hazardous materials inventory summaries dated April 9, 1991, February 1, 1995, November 15, 1996, January 27, 1997 indicated the site contained “electrical equipment in station” and indicated the following hazardous materials were stored “insulating oil, solvent refined hydrotreated middle distillate, butylated hydroxyl toluene, and severely hydrotreated light naphthenic distillate.” An investigation report dated October 10, 1999 indicated “Tulare electrical distribution yard is gone, this was located on Lockheed Property Plant B6.”
- **3615 North San Fernando Road:** A permit dated February 12, 1979 was for the installation of an 8,000-gallon diesel fuel UST. A permit dated April 8, 1987 issued by the LACDPW was for the removal of the 8,000-gallon diesel fuel UST. A note on the permit indicated the UST was removed on April 12, 1987. A report called “Preliminary Soil Contamination Exploration Abandonment of Underground Storage Tank” by Engineering Geology dated May 11, 1987 outlined the soil sampling completed beneath the former UST. Based on the findings, no petroleum hydrocarbons were noted. Although a closure letter was not noted, based on the results of the sampling completed beneath the UST excavation, the former 8,000-gallon UST would not be considered an environmental concern to the site.

9.6 Department of Toxic Substances Control (DTSC)

Ardent searched the DTSC Envirostor website for records regarding the site. The site was listed on the Envirostor database as “Lockheed Aeronautical Systems Co” under the address of 2555 North Hollywood Way. The listing was for a tiered permit. No additional information regarding the tiered permit was provided on the website.

Ardent has also requested records regarding the site from the DTSC. Records reviewed were dated 1987 through 1995 and were regarding the site and other Lockheed properties in the site vicinity. Records included correspondence associated with tiered permits for wastewater treatment units. Reports dated February 22, 1995, indicated the closure of wastewater treatment units at plants including A-1, B-1, and B-6 (site). No additional records were noted.

10 FINDINGS, OPINIONS AND CONCLUSIONS

Based upon the results of this Phase I ESA the following findings, opinions and conclusions are provided.

10.1 Findings and Opinions

The following presents a summary of findings and opinions associated with this Phase I ESA performed for the subject property, including known or suspect RECs, controlled RECs, and de minimus environmental conditions (i.e., conditions that generally do not present a material risk of harm to public health or the environment).

- The site was used for agricultural purposes or vacant land from at least 1928 through the late-1930s. From at least 1944 through the 1990s, the site was used for aircraft research, manufacturing, warehouse, maintenance, and office purposes. The site buildings were razed from 1997 through 2001. The site is currently vacant land, with the exception of a small portion of the northern property which is used by a company for long-term storage of automobiles and miscellaneous personal items in storage pods.
- The site is located within the San Fernando Valley Groundwater Basin which has been designated by EPA as a Federal Superfund Site due to groundwater contamination associated with historical industrial land uses. The areas of groundwater contamination, designated as "Operable Units," contain chemicals such as VOCs, namely TCE and PCE, and other chemicals such as hexavalent chromium and 1,4-dioxane. The site lies within the "Burbank Operable Unit." A number of investigations have been completed over the years, and based on the results, Lockheed has been named as one of many PRPs for contributing to the groundwater issues. Groundwater investigations completed at the site have shown elevated concentrations of PCE, TCE, and hexavalent chromium. Groundwater has been measured at the site at depths of approximately 220 feet below the ground surface (bgs) and flows in a southeasterly direction. Currently, there are three groundwater wells located on the site and groundwater monitoring is completed by Lockheed on an annual basis.

- The site was investigated in the early- to mid-1990s for possible VOC source areas as part of the RWQCB WIP associated with the San Fernando Valley Groundwater Basin Superfund Site. Investigations began in 1991 with an in-depth environmental assessment of the site presenting a comprehensive study of the historical land use, operations, and areas of concern. Based on the results of this investigation, at least 35 underground features consisting of 25 fuel USTs and 10 non-fuel USTs, sumps, and clarifiers were formerly located on-site. A number of AOCs were identified including USTs, ASTs, sumps, clarifiers, surface stains, process lines, degreasers, trenches and floor drains, and chemical storage and handling areas. These AOCs were subsequently investigated, impacted soils remediated, and USTs and underground features removed. Based on these investigations, NFA letters were issued by the RWQCB in 1996.
- As part of this Phase I ESA, Ardent reviewed these environmental reports and agency NFA letters. Based on our review and the fact that the site was part of a larger facility, it was difficult to determine whether all of the reported underground features had been properly removed from the site. In 1998, a geophysical survey was completed throughout the site to address the status of the underground features. Based on the results of the geophysical survey, no anomalies indicative of a UST were discovered. Based on this information, it appears that the reported USTs and underground features have been removed. In the 1990s, residual contaminants to be left in-place were evaluated by regulatory agencies based on the likelihood of migration to groundwater (i.e. for the protection of groundwater); with a lesser extent for the protection of human health. By the mid-2000s, agencies began evaluating in-place contaminants for the protection of groundwater and human health. Ardent completed a cursory evaluation of the chemical data of the residual contaminants that were allowed to be left in-place by the RWQCB in 1996. Ardent reviewed these data based on current regulatory guidelines based on human health risk criteria. Based on our review, there is a low likelihood that the residual contaminants would pose a human health risk through dermal contact.
- During completion of the earlier studies, soil gas investigations were completed as a screening tool to assess possible source areas of VOCs, and therefore, higher chemical detection limits were used. Current studies, used to evaluate human health risks, use much lower detection limits. Based on our evaluation of these historical data with respect to current human health risk guidelines, there is a high likelihood that residual contaminants could pose a potential threat to human health to future occupants through vapor intrusion.
- In the 2013, the RWQCB again requested investigations be completed at the site and surrounding properties to investigate possible source areas of hexavalent chromium that began being identified in close-by water wells. In 2014, an evaluation of on- and off-site AOCs was completed based on historical land use information. A number of on- and off-site AOCs were identified on the surrounding Lockheed properties. Laboratory results of subsequent soil sampling completed in the on-site AOCs showed low concentrations of hexavalent chromium. Based on this information, the RWQCB concluded that there was a low likelihood that the site had contributed to the chromium issue. However, because additional investigations are still needed at other Lockheed properties in the site vicinity, this case is still considered open with the RWQCB.

- Asbestos-containing Transite piping is reportedly located beneath the site; the extent of which is unknown.
- During the site reconnaissance, Ardent observed a former Pump House associated with a 509,000-gallon water reservoir located in the mid-eastern portion of the site. Although these features are not considered an environmental concern to the site, these features will need to be managed during redevelopment activities.
- No other- on or off-site environmental issues were noted for the site.

10.2 Conclusions

Ardent has performed this Phase I ESA in general conformance with the scope and limitations of the ASTM Practice E 1527-13, ASTM Practice E 2600-15, and the EPA Standards and Practices for AAI, Final Rule (40 CFR, Part 312), for a portion of the former Lockheed Plant B6 property located in the city of Burbank, California. Any limitations or exceptions encountered during completion of this report are stated in Section 1.4. No evidence or indication of RECs, or conditions indicative of releases or threatened releases of hazardous substances on, at, in, or to the subject property has been revealed, with the exception of the regional groundwater issues, reported Transite piping, and possible vapor intrusion issues.

11 RECOMMENDATIONS

Based on the results of this investigation, Ardent presents the following recommendations.

- A soil gas survey should be completed to assess current conditions at the site based on human health risk criteria. Following collection of the laboratory data, a Human Health Risk Assessment (HHRA) should be completed to assess whether a human health risk is present and whether engineering controls (e.g. a vapor barrier) are needed beneath the proposed building(s) to limit vapor intrusion.
- Due to the historical land use and residual contaminants known to exist at the site, a Soil Management Plan (SMP) is recommended to be prepared and implemented during grading/redevelopment activities. The SMP will document the program participants including contact information and description of responsibility, agency involvement, and health and safety measures. The SMP will also present procedures to be followed if impacted soil or unknown environmental features are encountered. This will include sampling criteria and analytical procedures.

- Since the existing groundwater monitoring wells are part of a larger monitoring program associated with the Federal Superfund Site, if the wells are needed to be abandoned and/or relocated due to proposed construction plans, authorization needs to be obtained from the EPA. Typically, the well owner/operator would obtain EPA approval.
- If during grading activities Transite piping is discovered, these materials should be removed by a State-licensed abatement contractor. The client should account for the mitigation measures in its grading budget.

13 QUALIFICATIONS STATEMENT AND SIGNATURE OF ENVIRONMENTAL PROFESSIONAL

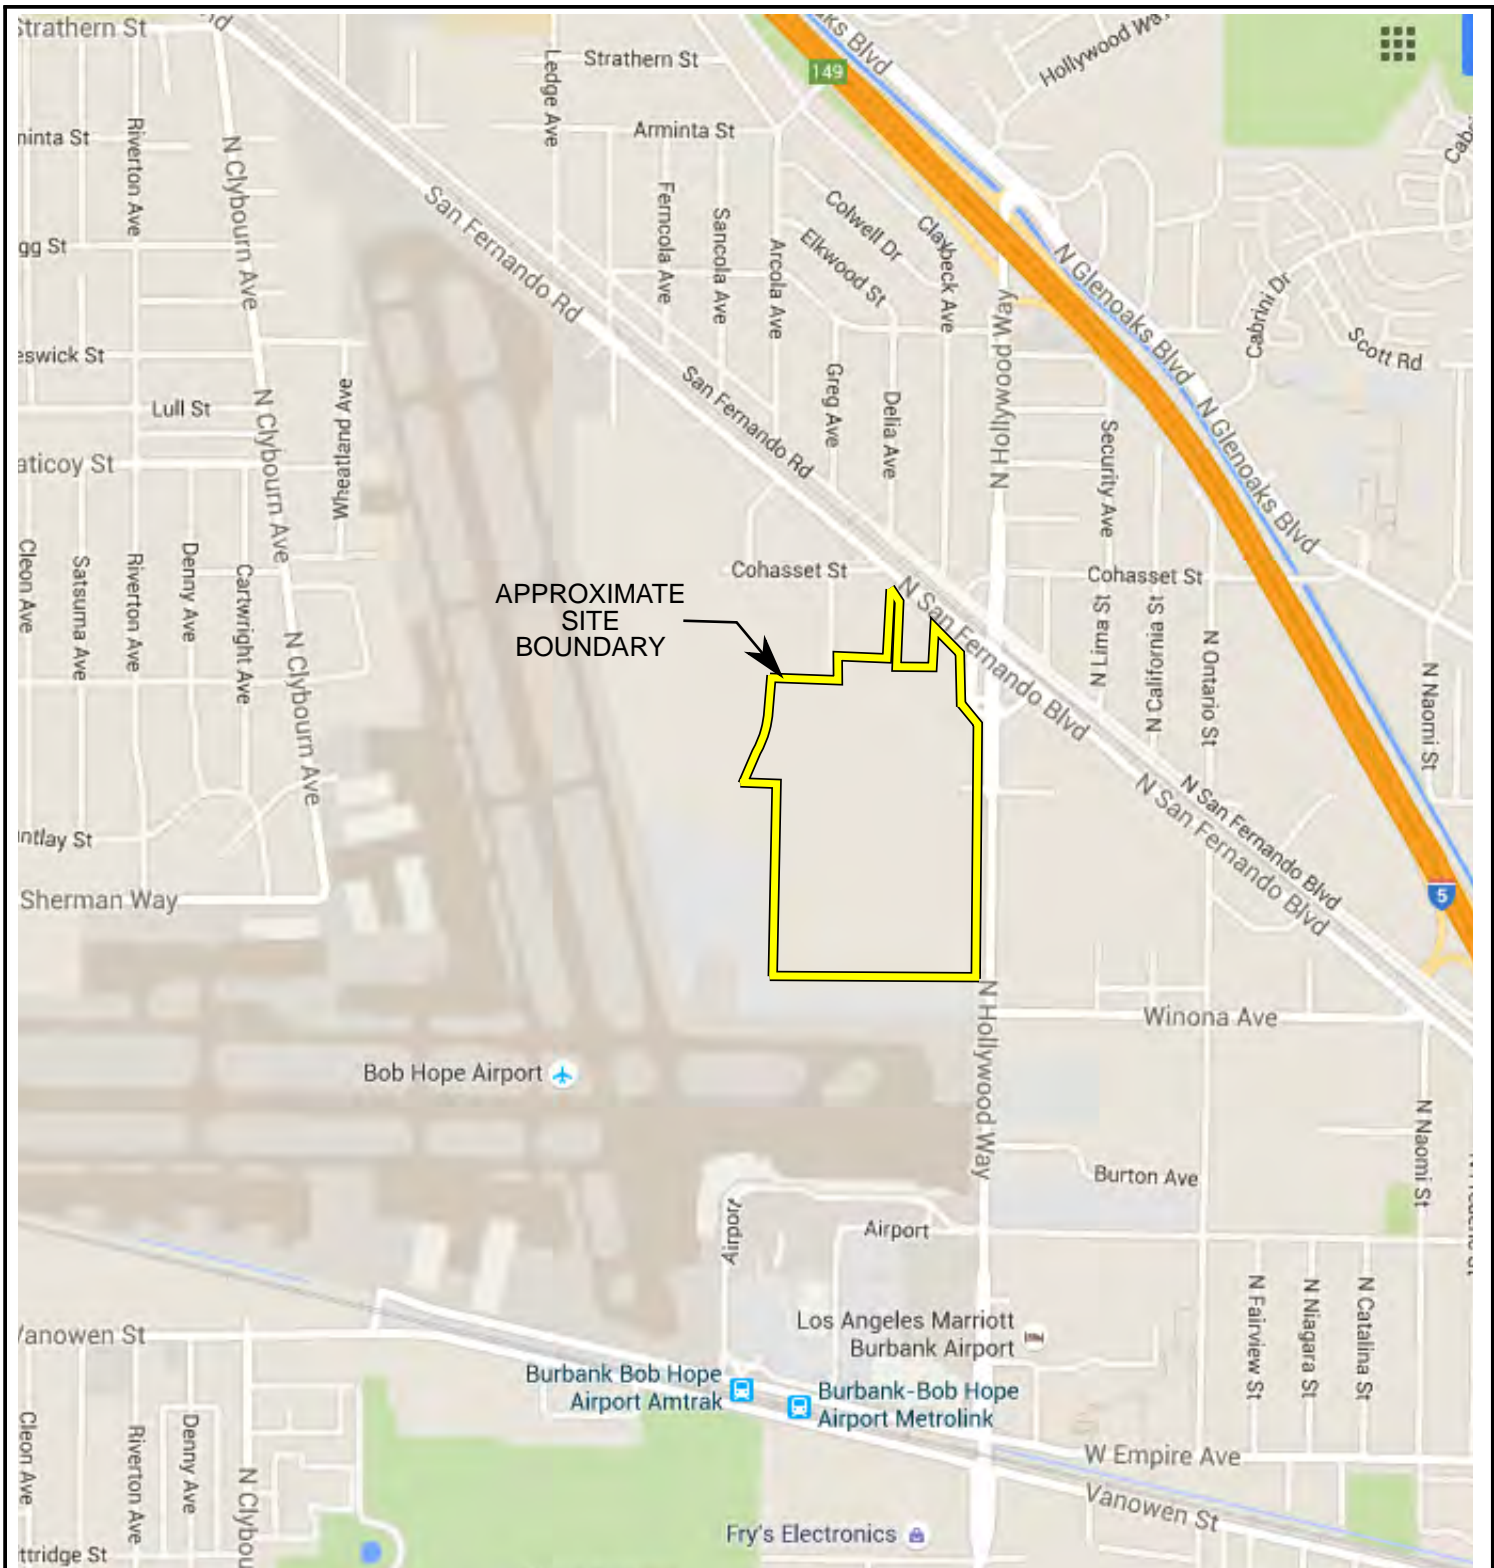

Mr. Paul Roberts states that the Phase I ESA was performed under his direct supervision, and that he has reviewed and approved the report, and the methods and procedures employed in the development of the report conform to the minimum industry standards. Mr. Roberts certifies that Ardent project personnel and subcontractors are properly licensed and/or certified to do the work described herein.

Pursuant to Paragraph 12.13 of the ASTM Standard E1527-13:

I declare that, to the best of my professional knowledge and belief, I meet the definition of *Environmental professional* as defined in §312.10 of 40 CFR 312. I have the specific qualifications based on education, training, and experience to assess a *property* of the nature, history, and setting of the subject *property*. I have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Paul Roberts, P.G.
Principal Geologist

In Shallow Zone In 2008
San Fernando Valley Superfund Sites

CH2MHILL

- NOTES:**
1. The areas of contamination shown on this map represent generalized two-dimensional approximations based on water quality analysis from Monitoring Wells, Facility Wells, and Production Wells where the top of screened interval is within 50 feet of the water table.
 2. Due to the possible vertical zonation of contamination, a well within an identified area of contamination may produce water with contamination different than that indicated on this map.
 3. Areas of contamination are based on the most recent record available for wells sampled.
 4. Areas outside the colored area of contamination represented on this map may also be contaminated. However, the most recent data available from wells located outside the colored area of contamination on this map are below the detection limit of 2 µg/L.
 5. The original figure is produced in color. Significant information is lost if copied in black and white.

APPENDIX B
USER QUESTIONNAIRE

PHASE I ENVIRONMENTAL SITE ASSESSMENT (ESA) USER QUESTIONNAIRE

In order to qualify for one of the *Landowner Liability Protections (LLPs)* offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the "*Brownfields Amendments*"), the user of the Phase I ESA must provide the following information (if available) to the *environmental professional*. Failure to provide this information could result in a determination that "*all appropriate inquiry*" is not complete.

Project Information	
Facility Name and Address:	Burbank Trust Property Burbank, CA
Reason for the Phase I ESA:	Acquisition
Type of Property:	Commercial
Site Owner and Contact Information:	Burbank-Glendale-Pasadena Airport Authority
Site Contact Name and Contact Information:	John Hatanaka 818-557-0263
Tax Assessors Parcel Number (APN):	APN(S): 2466-011-908, 2466-011-909, portion of 2466-011-910 and all of APNS: 2466-011-911; 2466-028-907 and 2466-028- 908.

	Yes	No
1. Are you aware of any environmental cleanup liens against the subject property that are filed or recorded under federal, state, or local law?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
2. Are you aware of any activity use limitations, such as engineering controls (engineered caps, liners, treatment methods, etc.), land use restrictions, or institutional controls (administrative measures restricting groundwater use, construction, or property use, etc.) that are in place at the site and/or have been filed or recorded in a registry under federal, tribal, state, or local law?	<input checked="" type="checkbox"/>	<input type="checkbox"/>
3. Do you have any specialized knowledge or experience related to the subject property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the subject property so that you would have specialized knowledge of the chemicals or processes used by this type of business?	<input type="checkbox"/>	<input checked="" type="checkbox"/>
4a. Does the purchase price being paid for the subject property reasonably reflect the fair market value of the subject property?	<input checked="" type="checkbox"/>	<input type="checkbox"/>
4b. If you conclude that there is a difference in fair market price, have you considered whether the lower purchase price is because contamination is known or believed to be present at the property?	<input type="checkbox"/>	<input type="checkbox"/>
5. Are you aware of any commonly known or reasonably ascertainable information about the subject property that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example, as a user,	<input checked="" type="checkbox"/>	<input type="checkbox"/>
5 (a) Do you know of the past uses of the property?	<input checked="" type="checkbox"/>	<input type="checkbox"/>
5 (b) Do you know of any specific chemicals that are present or were once present on the subject property?	<input type="checkbox"/>	<input checked="" type="checkbox"/>

5 (c) Do you know of spills or other chemical releases that have taken place at the subject property?		X
5 (d) Do you know of any environmental cleanups that have taken place at the subject property?		X
6. As the user of this ESA, based on your knowledge and experience related to the subject property, are there any obvious indicators that point to the presence or likely presence of contamination at the subject property?	X	

If you answered "yes" to any of the questions (except 4a) above, please provide more detail below, or attach additional information to this document:

Check previous environmental reports, past clean-up and ground watering wells.

Lockheed is responsible party. Land use restriction per the PSA.

NOTICE OF CONSENT TO ORDER
 OF INDEMNIFICATION

21
 22
 23 Lockheed hereby consents to the following order of indemnification to be
 24 included in the judgment herein:

25
 26 Defendant Lockheed Martin Corporation shall indemnify and defend
 Plaintiff and its successors and assigns (including but not limited to tenants,
 28 lessees, ground lessees, and subsequent owners in the chain of title from Plaintiff)

1 against liabilities, losses, costs or expenses arising out of claims, causes of action
 2 or suits by third parties other than Plaintiff's successors and assigns, or by
 3 governmental agencies, for damages (including response costs as defined in
 4 CERCLA) caused by environmental conditions relating to groundwater
 5 contamination existing as of the date Plaintiff was granted possession of the
 6 property in this proceeding, arising from or related to said persons' status as an
 7 owner or operator of the subject property under applicable state or federal law.

8
 9 Provided, however, that: (1) nothing in this Judgment shall limit or
 0 otherwise affect Lockheed Martin's rights, whether arising under law, contract, or
 1 otherwise, to seek indemnity, contribution, set-off, or other reimbursement from
 2 any person who, notwithstanding a relationship with the subject property arising
 3 after Plaintiff was granted possession of the property, is subject to liability on an
 4 independent basis - *i.e.* not arising from its status as an owner or operator of the
 5 subject property under applicable state or federal law - for environmental
 6 conditions relating to groundwater contamination; and (2) this Order of Indemnity
 7 shall be effective only upon the Authority's satisfaction of the Judgment.

PROOF OF SERVICE

I, Suzanne Tieche, declare:

I am a resident of the State of California and over the age of eighteen years, and not a party to the within action; my business address is 400 South Hope Street, Los Angeles, CA 90071-2899. On February 25, 1999, I served the within documents:

NOTICE OF CONSENT TO ORDER OF INDEMNIFICATION

- by transmitting via facsimile the document(s) listed above to the fax number(s) set forth below on this date before 5:00 p.m.
- by placing the document(s) listed above in a sealed envelope with postage thereon fully prepaid, in the United States mail at Los Angeles, California addressed as set forth below.**
- by placing the document(s) listed above in a sealed envelope and affixing a pre-paid air bill, and causing the envelope to be delivered to a _____ agent for delivery
- by causing said document(s) to be personally delivered to the person(s) at the address(es) set forth below.*

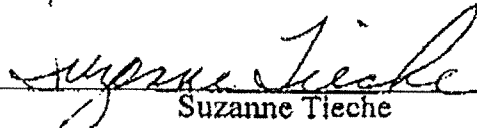

*Robert D. Crockett, Esq.
 Latham & Watkins
 633 West Fifth Street, Ste. 4000
 Los Angeles, CA 90071-2007
 Fax: 213-891-8763

**Roger M. Sullivan, Esq.
 Joseph S. Dzida, Esq.
 Sullivan, Workman & Dee
 800 South Figueroa, 12th Floor
 Los Angeles, CA 90017-2521
 Fax: 213-627-7128

I am readily familiar with the firm's practice of collection and processing correspondence for mailing. Under that practice it would be deposited with the U.S. Postal Service on that same day with postage thereon fully prepaid in the ordinary course of business. I am aware that on motion of the party served, service is presumed invalid if postal cancellation date or postage meter date is more than one day after date of deposit for mailing in affidavit.

I declare under penalty of perjury under the laws of the State of California that the above is true and correct.

Executed on February 25, 1999, at Los Angeles, California.

 Suzanne Tieche

WHEREAS on August 8, 1996, plaintiff Burbank-Glendale-Pasadena Airport Authority (the "Authority") filed a complaint in this condemnation action to condemn an approximately 130-acre parcel of property more particularly described in Exhibit "A-1" attached hereto and incorporated herein by this reference (the "B-6 Property"); and

WHEREAS Lockheed Corporation has merged with and into Lockheed Martin Corporation ("Lockheed") and Lockheed has acquired ownership of the B-6 Property by operation of law; and

WHEREAS the condemnation action came on for trial on April 12, 1999; and

WHEREAS a jury determined the value of the B-6 Property as of February 13, 1997, to be \$86,012,056.00 (the "Verdict Amount"); and

WHEREAS on June 25, 1999, the trial court, the Honorable Carl J. West presiding, entered a judgment (the "Judgment") for the net amount of \$59,286,068.00 (calculated as the Verdict Amount of \$86,012,056.00, less an offset for \$740,000.00 withdrawn by Aircraft Services International, Inc., less \$36,952,000.00 withdrawn from the deposit by Lockheed, plus interest on this resulting subtotal in the amount of \$5,805,289.00, plus precondemnation delay damages in the amount of \$5,160,723.00); and

WHEREAS the Judgment provided that the Authority would be entitled to an Order of Condemnation upon payment of the sums set forth immediately above; and

WHEREAS on June 25, 1999, the Court ordered the Authority to increase its deposit for the B-6 Property by a total amount of \$59,286,068.00 payable as follows: \$30,000,000.00 due on July 26, 1999 (the "First Deposit") and \$29,286,068.00 due on August 24, 1999 (the "Second Deposit"); and

WHEREAS on July 26, 1999, the Authority paid Lockheed \$5,160,723.00 and, on August 6, 1999, paid Lockheed an additional \$24,839,277.00, which sums

1 Lockheed and the Authority have agreed satisfy the Authority's obligations to make the
2 First Deposit; and

3 WHEREAS on August 24, 1999, the Authority made the Second Deposit
4 required by the Court's June 25, 1999 order; and

5 WHEREAS on October 5, 1999, the Court entered a separate order,
6 requiring the Authority to pay Lockheed's litigation expenses, including attorney fees and
7 costs, in the amount of \$8,558,561.00; and

8 WHEREAS on October 20, 1999, the Authority paid Lockheed
9 \$8,558,561.00 pursuant to the Court's October 5, 1999 order and the Authority paid
10 Lockheed \$435,626.50 which represents interest accrued on the First and Second Deposits
11 between June 24, 1999 and August 24, 1999; and

12 WHEREAS on November 15, 1999, the Authority paid Lockheed
13 \$24,620.84 ("Additional Interest 1") which represented interest that had accrued on the
14 \$8,558,561.00 in costs, attorneys fees and other litigation expenses from October 5, 1999
15 to October 20, 1999; and

16 WHEREAS on November 15, 1999, the Authority also paid Lockheed an
17 additional \$131,975.32 to which Lockheed was entitled from the County Treasury
18 ("Additional Interest 2") which represented interest that had accrued on the Second
19 Deposit from August 24, 1999 until September 24, 1999; and

20 WHEREAS the Authority and the City of Burbank (the "City") have
21 executed an agreement denominated the Amended, Restated and Superceding Escrow
22 Agreement ("Restated Escrow Agreement"); and

23 WHEREAS the Authority, the City and Security Trust Company, for itself
24 and its successors and assigns (collectively, the "Trustee"), have executed an Amended,
25 Restated and Superceding Land Title Trust Agreement (the "Restated Trust Agreement");
26 and

27 WHEREAS the Authority and the City have executed a Grant of Easements,
28

1 Declaration of Use Restrictions and Agreement for Adjacent Property for the part of the
2 B-6 Property described in Exhibit "A-2" as the "Adjacent Property" (the "Adjacent
3 Property Easement") and the City, the Authority and the Trustee have executed a Grant of
4 Easements, Declaration of Use Restrictions and Agreement for Trust Property for the part
5 of the B-6 Property described in Exhibit "A-3" as the "Trust Property" (the "Trust
6 Property Easement") (collectively, the "Easement Agreements"), which will be recorded
7 in the Official Records of Los Angeles County immediately after the recordation of a
8 certified copy of this Final Order of Condemnation ("Final Order"); and
9

10 WHEREAS the Authority, the City and Trustee have executed a
11 Memorandum of Option that will be recorded in the Official Records of Los Angeles
12 County immediately after the recordation of the Easement Agreements; and

13 WHEREAS the decision of the Court of Appeal for the Second Appellate
14 District in *City of Burbank et al. v. Burbank-Glendale-Pasadena Airport Authority*, 72
15 Cal. App. 4th 366 (1999), review denied August 11, 1999, upheld the City's right and
16 power to approve or disapprove the acquisition of property in the City of Burbank by the
17 Authority for purposes of expanding or enlarging the Burbank-Glendale-Pasadena Airport
18 (the "Airport") under California Public Utilities Code Section 21661.6 ("PUC Section
19 21661.6"); and

20 WHEREAS the Authority and the City have executed, conditioned upon
21 entry of this Final Order, (1) a Request to Dismiss Without Prejudice the Authority's
22 remaining claims in *City of Burbank, et al. v. Burbank-Glendale-Pasadena Airport*
23 *Authority*, Case No. EC 022341, (2) a [Proposed] Final Judgment in Case No. EC 022341,
24 and (3) a [Proposed] Final Judgment Denying Petition For Writ in *Burbank-Glendale-*
25 *Pasadena Airport Authority v. City of Burbank*, Case No. ES 004248, thereby resolving
26 all issues that could bar entry of this Final Order; and

27 WHEREAS pursuant to PUC Section 21661.6, the Burbank City Council
28 has approved the Authority's "Application for Approval of Land Acquisition ("Adjacent

1 Property") and Amendment to Second Superseding Application for Approval of Land
2 Acquisition (For Remaining "B-6 Property")" (the "Adjacent Property Section 21661.6
3 Application") as evidenced by Burbank Resolution No. 25,632 (attached as Exhibit "B");
4 and

5
6 WHEREAS the Authority has fully complied with the Judgment, the
7 Court's June 25, 1999 order and the Court's October 5, 1999 order and satisfied all other
8 conditions to entry of this Final Order; and

9 WHEREAS the City has given its written consent to entry of this Final
10 Order and thereby agreed, upon its entry: (i) to waive and relinquish all of its rights, if
11 any, to appeal from this Final Order or any other judgment or order in this case, (ii) to
12 waive and relinquish all of its rights, if any, to challenge collaterally this Final Order or
13 any other judgment or order in this case and (iii) to bear its own costs and attorneys fees in
14 this action; and

15 GOOD CAUSE APPEARING THEREFOR,

16 **IT IS HEREBY ORDERED AND ADJUDGED:**

17 A. THE "ADJACENT PROPERTY"

18 1. Subject to the limitation in paragraph 2, all right, title and interest in
19 the Adjacent Property of Lockheed Martin Corporation and its predecessors, successors,
20 subsidiaries and affiliates; Lockheed Corporation, Lockheed Aircraft Corporation,
21 Lockheed Air Terminal, Inc., Rainer Equipment Leasing, Inc., Aircraft Services
22 International, Inc. and their predecessors, successors, subsidiaries and affiliates; the Los
23 Angeles County Tax Collector; and all persons unknown claiming an interest in the
24 Adjacent Property are hereby condemned to and taken for public use by the Authority
25 subject to and in accordance with the terms of the Adjacent Property Easement, as
26 follows: (a) for the uses described in this Court's July 9, 1997 Stipulated Order in *City of*
27 *Burbank v. Burbank-Glendale-Pasadena Airport Authority*, Case. No. EC 022341, a true
28 and correct copy of which is attached hereto as Exhibit "C"; (b) for the purpose of

1 ensuring that the use and development of the Adjacent Property shall be consistent with
2 the California Airport Noise Standards, California laws and regulations regarding the
3 construction of obstructions to air navigation (including PUC Section 21659) and Federal
4 Aviation Administration ("FAA") guidelines with respect to clear zones, setbacks, height
5 limits, and electromagnetic and light interference; (c) for the purpose of imposing
6 development restrictions, as described in the Restated Escrow Agreement and established
7 under the Adjacent Property Easement, to ensure that the Adjacent Property is not used
8 for any structure, construction or development project to expand or enlarge the Airport
9 except as permitted by the City; and (d) upon the granting of approval therefor by the
10 City pursuant to PUC Section 21661.6 and the City's other land use and zoning powers,
11 including but not limited to the City's Zoning Ordinance and General Plan and the
12 Burbank Redevelopment Agency's Golden State Redevelopment Plan, and only upon the
13 granting of such approval, for purposes of expanding and enlarging the Airport consistent
14 with the terms of the Restated Escrow Agreement and the Adjacent Property Easement.

15 2. Unless and until the City approves the Authority's development plan
16 for the B-6 Property pursuant to PUC Section 21661.6 and its land use laws, as evidenced
17 by an "Acknowledgement Of Development Approval" or a "Notice Of Election To
18 Proceed Under Development Agreement As Modified" (as defined in the Restated Escrow
19 Agreement), which has been signed, acknowledged and recorded in the official land title
20 records of Los Angeles County, nothing in this Final Order shall authorize the use of the
21 Adjacent Property for any purpose other than the purposes set forth in Burbank Resolution
22 No. 25,632 (Exhibit "B"). Upon recordation of either an "Acknowledgement of
23 Development Approval" or "Notice of Election to Proceed Under Development
24 Agreement as Modified," *the use restrictions established by* the Court's July 9, 1997 Stipulated Order in *City of Burbank v.*
Burbank-Glendale-Pasadena Airport Authority, Case. No. EC 022341, and adopted in this final order, shall have no
25 further force or effect, ~~and the use restrictions contained therein shall be of no further force~~
26 ~~or effect,~~
27
28

1 3. Upon recordation of a certified copy of this Final Order with the
2 County Recorder of the County of Los Angeles, State of California, all right, title and
3 interest in the Adjacent Property described herein, subject to and in accordance with the
4 terms of the Adjacent Property Easement, shall vest in the Authority, its successors and
5 assigns.

6 4. Pursuant to Sections 4986, 5082 and 5086 of the Revenue and
7 Taxation Code, all ad valorem real property taxes and any penalties and costs related
8 thereto pertaining to the Adjacent Property described herein are canceled, as of June 8,
9 1997, the date of possession, upon recordation of a certified copy of this Final Order.

10 B. THE "TRUST PROPERTY"

11 1. The portion of the B-6 Property referred to herein as the Trust
12 Property consists of that portion of the B-6 Property not included in the Adjacent
13 Property. Unless and until the City approves the Authority's development plan for the B-
14 6 Property pursuant to PUC Section 21661.6 and its land use laws, as evidenced by an
15 "Acknowledgment Of Development Approval" or a "Notice Of Election To Proceed
16 Under Development Agreement As Modified," which has been signed and acknowledged
17 by the City and recorded in the official land title records of Los Angeles County, nothing
18 in this Final Order shall be understood to confer or vest any right, title or interest in the
19 Trust Property in the Authority (excepting the limited right to occupy and possess the
20 Trust Property as provided in paragraph B.6 below) or to authorize the use of the Trust
21 Property for the purpose of expanding or enlarging the Airport, and the Authority may not
22 use the B-6 Property for the purpose of expanding or enlarging the Airport and may not
23 acquire any right, title or interest in the Trust Property.

24 2. All right, title and interest in the Trust Property of Lockheed Martin
25 Corporation and its predecessors, successors, subsidiaries and affiliates; Lockheed
26 Corporation, Lockheed Aircraft Corporation, Lockheed Air Terminal, Inc., Rainer
27 Equipment Leasing, Inc., Aircraft Services International, Inc. and their predecessors,
28

1 successors, subsidiaries and affiliates; the Los Angeles County Tax Collector; and all
2 persons unknown claiming an interest in the Trust Property are hereby condemned to and
3 taken for public use, subject to and in accordance with the terms of the Trust Property
4 Easement, as follows: (a) for the uses described in this Court's July 9, 1997 Stipulated
5 Order in *City of Burbank v. Burbank-Glendale-Pasadena Airport Authority*, Case. No. EC
6 022341, Exhibit "C" hereto, to the extent such uses do not constitute the expansion or
7 enlargement of the Airport under PUC Section 21661.6; (b) for the purpose of imposing
8 development restrictions, as described in the Restated Escrow Agreement and established
9 under the Trust Property Easement, to ensure that the Trust Property is not used for
10 purposes of expanding or enlarging the Airport except as permitted by the City; (c) for the
11 purpose of insuring, in the event that the Trust Property is sold or transferred to a party
12 other than the Authority in accordance with the terms of the Restated Escrow Agreement
13 and Restated Trust Agreement, that the use and development of the Trust Property shall
14 be consistent with the California Airport Noise Standards, California laws and regulations
15 regarding construction of obstructions to air navigation (including PUC Section 21659),
16 and FAA guidelines with respect to clear zones, setbacks, height limits, and
17 electromagnetic and light interference, and (d) upon the granting of permission therefor by
18 the City pursuant to PUC Section 21661.6 and the City's other land use and zoning
19 powers, including but not limited to the City's Zoning Ordinance and General Plan and
20 the Burbank Redevelopment Agency's Golden State Redevelopment Plan, and only upon
21 granting such permission, for purposes of expanding and enlarging the Airport consistent
22 with the terms of the Restated Escrow Agreement and the Trust Property Easement.

23 3. Pursuant to PUC Section 21661.6, the Authority may not acquire any
24 portion of the Trust Property for the purpose of expanding or enlarging the Airport unless
25 and until the Burbank City Council has approved the Authority's plan to expand or
26 enlarge the Airport. In order to achieve the public purposes set forth in paragraph B.2,
27 above, in a manner consistent with PUC Section 21661.6, pending a decision by the City
28

1 on the Authority's applications for permission to use the B-6 Property to expand or
2 enlarge the Airport, upon recordation of a certified copy of this Final Order with the
3 County Recorder of the County of Los Angeles, State of California, all right, title, and
4 interest in the Trust Property of Lockheed Martin Corporation and its predecessors,
5 successors, subsidiaries and affiliates; Lockheed Corporation, Lockheed Aircraft
6 Corporation, Lockheed Air Terminal, Inc., Rainer Equipment Leasing, Inc., Aircraft
7 Services International, Inc. and their predecessors, successors, subsidiaries and affiliates;
8 the Los Angeles County Tax Collector; and all persons unknown claiming an interest in
9 the Trust Property, subject to and in accordance with the terms of the Trust Property
10 Easement, shall vest in Security Trust Company, Trustee, and its successors and assigns
11 (collectively the "Trustee"), to hold the Trust Property and to transfer all right, title and
12 interest therein, subject to the terms of the Trust Property Easement, pursuant to the
13 Restated Escrow Agreement and the Restated Trust Agreement.

14 4. Pursuant to the Restated Escrow Agreement and the Restated Trust
15 Agreement, if a valid "Final Development Agreement" is not concluded, as evidenced by
16 a "Notice of Failure to Execute Development Agreement" or a "Notice of Invalidation of
17 Development Agreement", which has been signed and acknowledged by the City and
18 recorded in the land title records of Los Angeles County, no right, title and interest in the
19 Trust Property shall be transferred to, or vest in, the Authority, and all right, title or
20 interest in the Trust Property shall be sold and transferred by the Trustee, subject to and in
21 accordance with the terms of the Trust Property Easement, to the City or to third parties as
22 provided in the Restated Escrow Agreement and Restated Trust Agreement, with all
23 proceeds from such sale being paid to the Authority. The recordation of a deed describing
24 the Trust Property executed and acknowledged by the Trustee shall be conclusive
25 evidence of the Trustee's authority to sell and transfer all right, title and interest in the
26 Trust Property to the City or to any other party and, upon the recordation of the Trustee's
27 deed in favor of the City or other party, the Authority's limited right of possession and
28

1 occupancy as described in paragraph B.6 below shall terminate. The Authority shall
2 obtain all right, title and interest to the Trust Property if and only if the City approves the
3 Authority's request to construct a passenger terminal on the B-6 Property and has
4 recorded an "Acknowledgement Of Development Approval" or a "Notice Of Election To
5 Proceed Under A Development Agreement As Modified", as provided in the Restated
6 Escrow Agreement and the Restated Trust Agreement. The recordation of the
7 "Acknowledgement Of Development Approval" or the "Notice Of Election To Proceed
8 Under A Development Agreement As Modified" with the County Recorder of the County
9 of Los Angeles, State of California, and the recordation of a deed describing the Trust
10 Property executed and acknowledged by the Trustee, shall be conclusive evidence of the
11 Trustee's authority to transfer and vest in the Authority all right, title, and interest in the
12 Trust Property, subject to the provisions of the Trust Property Easement.

13 5. Pursuant to Sections 4986, 5082 and 5086 of the Revenue and
14 Taxation Code, all ad valorem real by taxes and any penalties and costs related thereto
15 pertaining to the Trust Property described herein are cancelled as of June 8, 1997, the date
16 of possession, upon recordation of a certified copy of this Final Order.

17 6. Until such time as the Authority acquires all right, title and interest to
18 the Trust Property or the Trust Property is sold and transferred to the City or to a third
19 party, the Trustee, except as provided in this paragraph, shall have the sole right to possess
20 and occupy the Trust Property, to the exclusion of all others, except as required by law.
21 The Authority, as provided in the Restated Trust Agreement, shall have the right to
22 possess and occupy the Trust Property only for the purposes permitted in the Court's July
23 9, 1997 Stipulated Order in *City of Burbank v. Burbank-Glendale-Pasadena Airport*
24 *Authority*, Case. No. EC 0223-41, to the extent such uses do not constitute the expansion
25 or enlargement of the Airport under PUC Section 21661.6, and only in accordance with
26 the Easement Agreements executed by the City and the Authority with respect to the B-6
27 Property. Upon recordation of either an "Acknowledgement of Development Approval"
28

1 or "Notice of Election to Proceed Under Development Agreement as Modified" ^{the use restrictions established by} at the ^{CG}
2 Court's July 9, 1997 Stipulated Order in *City of Burbank v. Burbank-Glendale-Pasadena*
3 *Airport Authority*, Case. No. EC 022341, ^{And adopted in this final order} shall have no further force or effect, ~~and the use~~
4 ~~restrictions contained therein shall be of no further force or effect.~~

5 C. OTHER PROVISIONS

6 1. This Final Order of Condemnation is intended only to cause passage
7 of title from Lockheed to the Authority and its designee, the Trustee, in accordance with
8 the Eminent Domain Law of the State of California and does not affect or alter the rights
9 of the parties with respect to each other or the subject property other than as such rights
10 and obligations may be affected prospectively by the passage of title.

11 2. Nothing in this Final Order shall be interpreted or construed as
12 establishing that the transfer of any right, title or interest in the B-6 Property and/or the
13 imposition of easements and restrictions on the use of the B-6 Property will preempt, or
14 create rights that will result in the preemption of, PUC Section 21661.6 or the City's local
15 land use laws, including, but not limited to the City's Zoning Ordinance and General Plan,
16 and the Burbank Redevelopment Agency's Golden State Redevelopment Plan, or
17 otherwise affect adversely the applicability, validity or enforceability of any of those laws.

Matrix Table of Responses

AOC	Area Of Concern (AOC)	Scope of work in April 2013 13267 Order	Additional Site Investigation Results	
			Soil and Soil Vapor	Groundwater
1	B-1 Historic Injection Well Dry Well 1 (DW-1)	2 soil boring through the vadose zone to fine grained unit, between 115 and 150 feet below ground surface (bgs). Industrial Waste water containing hexavalent chromium (CrVI) may have been discharged via this feature. Groundwater well installation to be determined (TBD).	Results do not present evidence of a chromium (Cr), CrVI, or volatile organic compounds (VOCs) release in the soil boring locations.	Results do not present evidence of a Cr, CrVI, or VOCs release in the soil boring locations or to the underlying groundwater.
2	B-1 DW-2 and DW-2A	2 soil borings through the vadose zone to fine grained unit, between 115 and 150 feet bgs. 3 new groundwater wells between CW-29 and CW-12. Industrial waste water containing CrVI may have been discharged via this feature. 3 new groundwater wells installed between CW-29 and CW-12.	Concentrations of CrVI were detected in soil borings at 40-feet, 45-foot and 70 feet bgs. CrVI was not detected at any other sample interval from 75-feet bgs to the bottom of the soil borings at 150-feet bgs.	No data exists to determine whether Cr, CrVI and VOCs have migrated to the regional groundwater. This indicates a data gap which needs to be resolved.
3	B-1 DW-3 Seepage Pit	1 soil boring through the vadose zone to fine grained unit, between 115 and 150 feet bgs. Industrial waste water containing CrVI may have been discharged via this feature. Groundwater well installation TBD	Results do not present evidence of a Cr, CrVI, or VOCs release in the soil boring locations.	Results do not present evidence of a Cr, CrVI, or VOCs release in the soil boring locations or to the underlying groundwater.
4	B-1 DW-4	1 soil boring through the vadose zone to the fine-grained unit, between 115 feet and 150 feet bgs; Install soil vapor probes at depth to be determined for VOCs. Industrial waste water containing CrVI and VOCs may have been discharged via this feature. Groundwater wells TBD	Results do not present evidence of a Cr, CrVI, or VOCs release in the soil boring locations.	No data exists to determine whether Cr, CrVI and VOCs have migrated to the regional groundwater. This indicates a data gap which needs to be resolved.
5	B-1 DW-5	1 soil boring through the vadose zone to the fine-grained unit, between 115 feet and 150 feet bgs; Install soil vapor probes at depth to be determined for VOCs. Industrial waste water containing CrVI and VOCs may have been discharged via this feature. Groundwater wells TBD.	Results do not present evidence of a Cr, CrVI, or VOCs release in the soil boring locations.	Results do not present evidence of a Cr, CrVI, or VOCs release in the soil boring locations or to the underlying groundwater.
6	B-1 DW-6	2 soil borings through the vadose zone to the fine-grained unit, between 115 feet and 150 feet bgs; Install soil vapor probes at depth to be determined for VOCs. Industrial waste water containing CrVI and VOCs may have been discharged via this feature. Groundwater wells TBD	Results do not present evidence of a Cr, CrVI, or VOCs release in the soil boring locations.	Results do not present evidence of a Cr, CrVI, or VOCs release in the soil boring locations or to the underlying groundwater.
7	B-1 Building 175 Vapor Degreaser and Clarifier	2 soil borings through the vadose zone to the fine-grained unit greater than 40 bgs; Install soil vapor probes at depth to be determined (TBD) for VOCs. Area of historic PCE release does not appear to be adequately delineated or mitigated. Groundwater wells TBD	Concentrations of CrVI were detected in soil borings from 10-feet to a depth of 135-feet bgs, which is the deepest depth achieved during the investigation.	No data exists to determine whether Cr, CrVI and VOCs have migrated to the regional groundwater. This indicates a data gap which needs to be resolved.
8	B-1 Building 194/195 (portion of Former Buried Waste Area)	2 soil borings through the vadose zone to the fine grained unit greater than 40 feet bgs.; Install soil vapor probes at depth TBD for VOCs. Area of previous soil investigations is not delineated for CrVI. Groundwater wells TBD	Concentrations of CrVI were detected in soil borings at 15-feet, 30-feet, 40-feet, 45-feet, 55-feet and 60-feet bgs. The soil borings were not completed to the required depth of 150-feetbgs due to refusal. Therefore a data gap exists between the depth of 60-feet bgs down to the top of the regional groundwater.	No data exists to determine whether a release of Cr, CrVI and VOCs wastes which may have migrated to the regional groundwater. This indicates a data gap which needs to be resolved.
9	B-1 Former Buried Waste Area	2 soil borings through the vadose zone to the fine grained unit between approx. 80 feet and 100 feet bgs. Area of historic and undocumented waste disposal has not been adequately delineated. Groundwater wells TBD	Concentrations of CrVI were detected in soil borings from 10-feet, 20-feet, and 40-feet. The soil borings were not completed to the required depth of 150-feetbgs due to refusal. Therefore a data gap exists between the depth of 40-feet bgs down to the top of the regional groundwater.	No data exists to determine whether Cr, CrVI and VOCs have migrated to the regional groundwater. This indicates a data gap which needs to be resolved.
10	A-1 North Former CrVI Passivation Area	2 soil borings through the vadose zone to the fine grained unit between approx. 80 feet and 100 feet bgs.	Although the potential for a subsurface release of hexavalent chromium was deemed to be high in this area, due to the construction and redevelopment of the entire AOC into a multi-level park	
11	B-6 Building 371 Former CrVI Passivation Area	Two soil borings through the vadose zone to the fine grain unit between 80 and 100 ft. below grade. Install soil vapor probes at depth to be determined for VOCs. Groundwater wells TBD	Results do not present evidence of a Cr, CrVI, or VOCs release in the soil boring locations.	Results do not present evidence of a Cr, CrVI, or VOCs release in the soil boring locations or to the underlying groundwater.
12	B-6 Building 357 Complex - Dry Wells	One soil boring through the vadose zone to the fine grain unit between 80 and 100 ft. below grade, per feature identified. Groundwater wells TBD	Results do not present evidence of a Cr, CrVI, or VOCs release in the soil boring locations.	Results do not present evidence of a Cr, CrVI, or VOCs release in the soil boring locations or to the underlying groundwater.
13	B-6 Building 353 Dry Wells and Clarifier B-6-F	One soil boring through the vadose zone to the fine grain unit between 80 and 100 ft. below grade, per feature identified. Industrial waste water containing CrVI may have been discharged via these features. Area of previous soil investigation was not delineated for CrVI. Groundwater wells TBD	Results do not present evidence of a Cr or VOCs release in the soil boring locations. However, a detectable concentration of CrVI was found at 85 ft. below grade. This may be an anomaly.	Results do not present evidence of a Cr, CrVI, or VOCs release in the soil boring locations or to the underlying groundwater.
14	B-6 Building 340 Dry Wells	One soil boring through the vadose zone to the fine grain unit between 80 and 100 ft. below grade, per feature identified. Industrial waste water containing CrVI may have been discharged via these features. Groundwater wells TBD	Results do not present evidence of a Cr, CrVI, or VOCs release in the soil boring locations.	Results do not present evidence of a Cr, CrVI, or VOCs release in the soil boring locations or to the underlying groundwater.
15	B-6 Building 332-333 Dry Well locations	One soil boring through the vadose zone to the fine grain unit between 80 and 100 ft. below grade, per feature identified. Industrial waste water containing CrVI may have been discharged via these features. Groundwater wells TBD	Results do not present evidence of a Cr, CrVI, or VOCs release in the soil boring locations.	Results do not present evidence of a Cr, CrVI, or VOCs release in the soil boring locations or to the underlying groundwater.
16	B-6 Building 310 Dry Well, Metal Finishing Line, Sump and Sand Traps	One soil boring through the vadose zone to the fine grain unit between 80 and 100 ft. below grade, per feature identified. Industrial waste water containing CrVI may have been discharged via these features. Groundwater wells TBD	Results do not present evidence of a Cr, CrVI, or VOCs release in the soil boring locations.	Results do not present evidence of a Cr, CrVI, or VOCs release in the soil boring locations or to the underlying groundwater.
17	B-6 Building 88 Dry Well locations	One soil boring through the vadose zone to the fine grain unit between 80 and 100 ft. below grade, per feature identified. Industrial waste water containing CrVI may have been discharged via these features. Groundwater wells TBD	Results do not present evidence of a Cr, CrVI, or VOCs release in the soil boring locations.	Results do not present evidence of a Cr, CrVI, or VOCs release in the soil boring locations or to the underlying groundwater.
18	B-6 Building 83 CrVI Use (former clarifier, sumps, sand traps and pits)	One soil boring through the vadose zone to the fine grain unit between 80 and 100 ft. below grade, per feature identified. Industrial waste water containing CrVI may have been discharged via these features. Groundwater wells TBD	Results do not present evidence of a Cr, CrVI, or VOCs release in the soil boring locations.	Results do not present evidence of a Cr, CrVI, or VOCs release in the soil boring locations or to the underlying groundwater.

Matrix Table of Responses

SUBJECT: Request For Plant B-6 Environmental Assessments

Dear Dios:

Per your request, I am enclosing the copies of the Environmental Assessments Reports (EAs) for Plant B-6, Parcel 1 and Parcel 2. The EAs were prepared by McLaren-Hart at Lockheed's request in 1991.

Should you have any questions please contact me at (818) 847-0166.

Sincerely,

Gene Matsushita,
Project Coordinator
Environmental Technical Services

Subject: Transmittal of Environmental Assessment for
Lockheed Plant B-6, Parcel 2 - Burbank, California

Dear Mr. Yacoub:

Enclosed are two (2) copies of the Environmental Assessment (EA) for Lockheed's Parcel 2 portion of the Plant B-6 facility located in Burbank. The EA was prepared at Lockheed's request by McLaren/Hart for Lockheed's Land Sale Project.

Should you have any questions regarding this matter please contact Gene Matsushita at (818) 847-0166.

Sincerely,

A handwritten signature in black ink, appearing to read "Ron Helgerson", with a long horizontal line extending to the right.

2550 North Hollywood Way, Suite 305
Burbank, California 91505

Dear Mr. Helgerson:

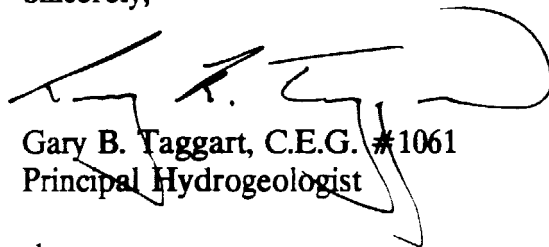

**ENVIRONMENTAL ASSESSMENT REPORT FOR THE LOCKHEED PLANT B-6
FACILITY, PARCEL 2, BURBANK, CALIFORNIA**

This report presents the environmental assessment for the Parcel 2 portion of Lockheed's Plant B-6 facility located at 2801 North Hollywood Way, Burbank, California. Parcel 2 consist of 65.2 acres of Plant B-6 bounded by Parcel 1 to the west, the Burbank-Glendale-Pasadena Airport to the south, the boundary between Plant B-6 and other private industry to the north, and Hollywood Way to the east.

The report describes the results of the site survey and inspection of buildings and other structures, former flight line areas, and associated areas at the Plant B-6, Parcel 2 area. Also included are the results of the aerial photograph and regulatory agency files reviews, and summaries of the site geologic and hydrogeologic conditions, facility operations history, chemical use practices, and previous and ongoing site investigations.

Should you have any questions or comments on the report, please contact us.

Sincerely,

Gary B. Taggart, C.E.G. #1061
Principal Hydrogeologist

SECTION 1

INTRODUCTION

This report presents the Phase I environmental assessment for the Parcel 2 portion of the Lockheed Aeronautical Systems Company (LASC) and Lockheed Advanced Development Company (LADC) Plant B-6 facility located at 2801 North Hollywood Way, Burbank, California. The Phase I environmental assessment has been performed at the request of the Lockheed Corporation in preparation for the sale of the Plant B-6 site. Parcel 2 consists of that portion of Plant B-6 east of the Parcel 1 boundary and west of Hollywood Way. The Phase I environmental assessment for Parcel 1 was completed and presented in the report titled "Environmental Assessment Report for the Lockheed Plant B-6 Facility, Parcel 1, Burbank, California" dated October 2, 1991. The environmental assessment of the remainder of the Plant B-6 site will be completed separately, as requested by Lockheed Corporation.

The purpose of the Phase I environmental assessment was to identify current and historical chemical use practices at the facility and to evaluate whether chemicals may have been discharged to the soil at the site. Specific project objectives included the following:

- Documentation of past and present work activities and chemical handling procedures on and immediately adjacent to the Parcel 2 portion of the Plant B-6 facility;
- Identification of areas which are potential sources of soil contamination beneath the site;
- Determination of the principal contaminants which may be associated with potential source areas of soil contamination; and
- Compilation of data to provide a basis for recommending a Phase II sampling plan to address each potential source area identified during the Phase I assessment.

The Phase I environmental assessment included inspection of buildings, parking areas, former flight lines, and chemical storage, usage, and disposal areas within and adjacent to the Parcel 2 portion of the B-6 facility. In addition, LASC files and facility engineering drawings, regulatory agency files, previous site investigation reports, and historical aerial photographs were reviewed. Current and former LASC employees were interviewed to provide information for the environmental assessment. A description of the environmental assessment approach and a discussion of the organization of this report are presented below.

1.1 ENVIRONMENTAL ASSESSMENT APPROACH

Descriptions of the methods used in the Phase I environmental assessment for Parcel 2 are presented below.

1.1.1 Aerial Photograph Review

Over 800 vertical and oblique aerial photographs from the years 1920 through 1988 were reviewed from several public and private sources to provide a history of land use practices and to identify past potential sources of environmental concern at the Plant B-6 facility. Vertical aerial photographs taken from 1937 to 1986, which are compiled in two reports prepared by Lockheed (LEMSCO, 1986; LESC, 1988a), were included in the review. The photographs, which provided resolution of features ranging in size from small buildings to 55-gallon drums, were examined for disposal locations, fill areas, chemical storage areas, potential spill areas, flight line operations, and general construction activity information.

1.1.2 Facility Engineering Drawings

Approximately 5,500 design drawings and as-builts were reviewed to obtain a thorough understanding of physical building designs and operations. These drawings and maps were examined for details on chemical use locations and storage capacities of clarifiers, sumps, tanks, and other equipment. The facility design drawings were obtained from two sources: the Lockheed Advanced Development Company Facilities Engineering Department, located at Plant A-1, and the Lockheed Corporate Records Center located at the Rye Canyon facility. All available design drawings were reviewed. Selected drawings that provide historical and current operations information were reproduced to aid site inspections. A LASC computer index file that lists titles of the facility drawings was consulted, and approximately 39 percent of the listed design drawings were located for review. An additional 847 drawings that were not listed were found and reviewed.

1.1.3 Literature Review

The literature review for the Plant B-6 facility included site assessment and other environmental study reports, which were authored by LASC and LASC contractors, and regulatory agency file documents. This information provided a basis for identifying areas of environmental concern, such as the documented chemical release at an underground storage tank, and provided details on chemical use practices, such as paint usage at a former paint spray booth.

Environmental reports prepared by or for LASC were reviewed to identify the following chemical waste storage, transfer and treatment facilities; clarifiers; underground and above ground tanks, and sumps; drainage systems; and other potential pathways for chemical migration to the soil. Several reports summarized site investigations and contained chemical data reflecting soil or groundwater conditions.

Agency file information was reviewed to identify any permits, site investigation and inspection reports, notices of violation, and soil and groundwater data for the Plant B-6 facility, and to obtain an overall understanding of the environmental compliance history of the plant.

Approximately 25 Factory Mutual fire insurance maps, compiled in 1942, approximately 1948, and 1965, were reviewed for the environmental assessment. The maps provided information on Plant B-6 facility building usage, building construction details, plant-wide water main locations, and underground fuel tanks.

1.1.4 Site Inspections

Detailed site inspections were conducted to identify past and present work practices, production flow, and operations at flight line areas at the Plant B-6 facility. Chemical use and storage facilities and chemical waste facilities were inspected. Site inspections concentrated on identifying or confirming former and current locations of underground and aboveground tanks, dip tanks, clarifiers, pipelines, sumps, disposal areas, chemical storage areas, flight lines, and paint spray booths. Surface drainage characteristics were identified and selected storm drain catch basins and trenches were inspected because they represent potential pathways for movement of chemicals to the soil. Follow-up site inspections were conducted, in many cases, to fill data gaps or resolve apparent discrepancies in information.

Site inspections did not include a detailed evaluation of the facility sewer and storm drain systems. A comprehensive sewer and storm drain site inspection program was not conducted for this environmental assessment because inspection and monitoring activities will be performed when the buildings and subsurface utilities are demolished and removed. That monitoring effort will guide potential future investigations of soil at these utilities.

An asbestos study of Plant B-6 was not included in the Phase I environmental assessment. A comprehensive asbestos survey will be performed as a separate task at a later date, prior to demolition of Plant B-6 buildings. Nevertheless, cursory inspections of insulated pipes and other readily accessible building interior structures were conducted, when practical, to assess the potential presence of asbestos containing material. Acoustic drop ceiling panels and nine- and 12-inch square floor tiles were noted during building inspections, since the ceiling panels, floor tiles and

mastic used to apply the tiles frequently contain asbestos particles. Roof surface covering information is also included in the building discussions for potential asbestos content information. Asphaltic-type roofing material frequently contains emulsified asbestos, as do certain reflective coating materials. Other types of roof surfaces include mineral surface caps, polyurethane Scotch clad-foam type roofs, and metal roofs, all of which do not contain asbestos.

Transformers and other electrical equipment were inspected for visual signs of leakage and oil spills. A thorough plant-wide polychlorinated biphenyl (PCB) survey was not conducted for this assessment, as LASC completed a survey in 1989. Transformer inspections consisted of noting information on the unit (if labeled) and checking for signs of leakage beneath each unit.

1.1.5 Employee Interviews

To supplement site inspections, interviews with current and retired LASC and LADC personnel were conducted to obtain information regarding past and present operations, and historical and ongoing chemical usage and waste handling practices. Several interviews were conducted with employees who had worked at the B-6 site over a 50 year period. In many cases, follow-up interviews were conducted to fill data gaps or resolve apparent discrepancies in information.

1.2 REPORT ORGANIZATION

The remainder of the report is organized in six sections which consist of the following:

Section 2	Site Characteristics;
Section 3	Site Background;
Section 4	Site Inspections;
Section 5	Regulatory Agency File Review;
Section 6	Conclusions; and
Section 7	References.

SECTION 2

SITE CHARACTERISTICS

The Lockheed Plant B-6 site consists of approximately 144 acres and is located in Burbank, California (Figure 2-1). Other Lockheed facilities in the Burbank area include Plant A-1, Plant B-1, and Plant C-1, as shown on Figure 2-1. The land surface at the Plant B-6 site slopes from an elevation of about 760 feet above mean sea level (MSL) in the northwestern part of the plant to about 700 feet MSL at the southeastern part of the plant. The site is bisected by Hollywood Way, which divides the Building 369 and 371 area to the east of the road from the remainder of the plant which lies west of the road. The portion of the Plant B-6 site investigated in this study consists of a 65.2-acre parcel (Parcel 2) bounded by the Burbank-Glendale-Pasadena Airport to the south, the eastern most boundary of the Parcel 1 area to the west, the boundary between Plant B-6 and other private industry to the north, and Hollywood Way to the east (Figure 2-2). The environmental assessment for the remaining area of Plant B-6 not included in Parcels 1 and 2 will be presented in subsequent reports as requested by Lockheed Corporation.

The geologic setting and hydrogeologic conditions underlying the Plant B-6 site are described below.

2.1 GEOLOGIC SETTING

The Lockheed Plant B-6 facility is located in the southeast portion of the San Fernando Valley. The San Fernando Valley is a west-northwest trending interior coastal basin approximately 23 miles long and 12 miles wide. The San Fernando Valley is surrounded by the Simi Hills to the west, the Santa Monica Mountains to the south, the Santa Susana Mountains to the north and northwest, the San Gabriel Mountains to the northeast, and the San Rafael Hills to the east. The Verdugo Mountains, located to the north and east of the Plant B-6 site, consist of a large block of crystalline basement rock which was isolated from the San Gabriel Mountains by faulting. The valley which separates the Verdugo and San Gabriel Mountains is included in the San Fernando Valley basin. Figure 2-3 shows the San Fernando Valley and surrounding physiographic features.

The San Fernando Valley is a down-faulted valley which has been partially filled with alluvial sediments. The valley slopes gently to the south-southeast, towards the Los Angeles River. Sediments within the valley were primarily deposited along the major tributaries to the Los Angeles River, including the Pacoima and Tujunga washes to the west of the Plant B-6 facility.

FIGURE 2-3
 THE SAN FERNANDO VALLEY
 AND SURROUNDING
 PHYSIOGRAPHIC FEATURES

ADAPTED FROM URS (1989)

The geological units within the San Fernando Valley form three general groups. The oldest group is made up of crystalline basement rocks which are Cretaceous in age or older (at least 65 million years old). Granitic rocks from this group outcrop in the Verdugo Mountains to the north and east of the Lockheed Burbank facilities. The second group unconformably overlies the oldest group and consists of sedimentary rocks, predominantly of marine origin, which are late Cretaceous to late Pliocene in age (2 to 65 million years old). These two older groups have been extensively faulted and folded by Tertiary and younger tectonic events (URS, 1989).

The third group can be divided into three subgroups: the Saugus Formation, Older Alluvium, and Younger Alluvium (URS, 1989). The Saugus Formation is the oldest subgroup and was deposited in the early Pleistocene (1 to 2 million years before the present). The Saugus Formation was deposited unconformably on the crystalline and sedimentary rocks described above, and is composed of poorly consolidated continental and marine conglomerates, sands, silts, and clays. The Saugus Formation has been deformed only in areas disrupted by relatively young faulting activity.

The Older Alluvium overlies the Saugus Formation, and was deposited in the late Pleistocene (10,000 to 100,000 years before the present). The Older Alluvium is composed of terrace deposits and thick sequences of poorly consolidated gravels, sands, and clays that have been uplifted and eroded to form terraces.

The Younger Alluvium consists of poorly sorted boulders, gravels, sands, and clays which were deposited in coalescing alluvial fans. The Younger Alluvium is Holocene in age (up to 10,000 years old) and overlies the Older Alluvium. In the eastern portion of the San Fernando Valley (near the Burbank site), the Younger Alluvium is mostly sand and gravel (70 percent), whereas in the western portion of the valley, silts and clays predominant (50 to 65 percent). The sediment sources of the Younger Alluvium in the eastern portion of the valley are primarily the Verdugo Mountains and San Gabriel Mountains. The finer sediment size in the western portion of the valley reflect deposition from sedimentary rock sources including the Santa Monica and Santa Susana Mountains and the Simi Hills. Generally, the Younger Alluvium is thicker layered, coarser grained, and less dense than the underlying Older Alluvium.

Lithologic logs for groundwater monitoring wells constructed at Lockheed's Burbank facilities indicate that the Plant B-6 site and surrounding areas rest on the Younger Alluvium. The Younger Alluvium appears to slope south-southeast and is approximately 350 feet thick at the Plant B-6 site. The Younger Alluvium beneath the Plant B-6 site primarily consists of interbedded layers of sand and gravel, silty sand, and silt (URS, 1989). The sand and gravel layers range from approximately 10

to 80 feet thick, with the thicker layers occurring at shallower depths. The silty sand and silt layers range from approximately 10 to 60 feet thick. Laterally extensive clay layers have not been encountered during drilling at the Plant B-6 site or surrounding facilities.

A coarse-grained cobble layer occurs at the base of the Younger Alluvium in the Burbank area. The cobble layer overlies a distinctive red to brown clayey-silt layer at the top of the Older Alluvium. Lithologic logs indicate that the Older Alluvium, at depth beneath the Plant B-6 site, consists of relatively thin beds of finer grained deposits (sand, silt, and clay, with some gravels) compared to the Younger Alluvium. The deep boreholes drilled at the Lockheed Burbank facilities only penetrate the upper portion of the Older Alluvium. The top of the underlying Saugus Formation is reported to be at least 1,200 feet below ground surface in the vicinity of the Plant B-6 site (URS, 1989).

2.2 HYDROGEOLOGIC CONDITIONS

Regional and local hydrogeologic conditions for the Lockheed Plant B-6 site are discussed below.

2.2.1 Regional Hydrogeology

The San Fernando Valley is semi-arid, with a mean annual precipitation of 15 to 20 inches (California State Water Rights Board, 1962). The valley is located within the Upper Los Angeles River Area (ULARA), which consists of that portion of the watershed and source tributary system of the Los Angeles River bounded by the Simi Hills on the west, the San Rafael Hills on the east, the Santa Susana and San Gabriel Mountains on the north, and the Santa Monica Mountains on the south. The Los Angeles River flows west to east along the southern edge of the San Fernando Valley and exits the valley in a southeasterly direction through the Los Angeles River Narrows (Figure 2-3).

The San Fernando Valley Groundwater Basin is the largest of four hydrologic basins within the ULARA. The San Fernando Valley Groundwater Basin extends throughout approximately 91 percent of the ULARA (112,000 acres), including the Burbank area. The three other basins in the ULARA include the Sylmar, Verdugo, and Eagle Rock basins.

Groundwater recharge to the San Fernando Valley Groundwater Basin occurs in the following three forms: 1) direct infiltration of precipitation; 2) artificial recharge of imported water and treated wastewater effluent; and 3) to a lesser extent, subsurface inflow from the adjacent groundwater basins (James M. Montgomery, 1988). Imported water sources include the Colorado River, the State Water Project, and the Mono Basin-Owens River System.

Depths to groundwater within the alluvial deposits of the San Fernando Valley Groundwater Basin range from approximately 50 to 300 feet below the ground surface (URS, 1989). The primary water-bearing deposits are the Older and Younger Alluvium. The greater depths to groundwater generally occur in the central part of the valley and around areas of heavy pumping. The alluvial aquifer is approximately 1,000 to 1,200 feet thick in the center of the San Fernando Valley and thins towards the edges of the valley.

The fine-grained deposits of the alluvial aquifer on the western side of the San Fernando Valley are less transmissive than the coarse-grained deposits in the eastern portion of the valley, where sand and gravel deposits predominate. The regional direction of groundwater flow throughout the valley is to the southeast toward the Los Angeles River Narrows. Groundwater velocities in the western portion of the San Fernando Valley have been estimated at between 5 to 100 feet per year, compared with 300 to 500 feet per year in the eastern portion of the valley (James M. Montgomery, 1988).

Alluvial sediments in the eastern portion of the San Fernando Valley contain approximately two-thirds of the groundwater storage capacity of the entire valley. The total storage capacity of the San Fernando Valley is approximately 3,000,000 acre-feet. A majority of the municipal wells in the San Fernando Valley are located in the eastern part of the valley because of the presence of highly permeable and transmissive sediments. The municipal wells include wells owned and operated by the Cities of Los Angeles, Burbank, and Glendale. Dense grouping of many of these wells has resulted in large cones of depression in the groundwater table.

2.2.2 Local Hydrogeology

Lockheed has installed over 100 groundwater monitoring wells at its Burbank facilities since 1986 to determine groundwater gradients, velocities, and water quality. This site characterization work is the principal source of information for specific hydrogeologic conditions at Lockheed's Burbank facilities. As of June 1991, a total of 25 groundwater monitoring wells have been constructed at or adjacent to the Plant B-6 site. The locations of wells in the vicinity of the Plant B-6 site are shown on Figure 2-4.

Both single- and multiple-screen monitor wells have been constructed at Plant B-6. The single-screen wells are completed at depths ranging from approximately 200 to 375 feet below ground surface in the Younger Alluvium and from approximately 490 to 600 feet below ground surface in the Older Alluvium. The multiple-screen wells have up to seven screened intervals within a single casing. Lockheed is in the process of converting multiple screen wells at the Plant B-6 facility to single screen wells.

FIGURE 2-4
MONITOR WELL LOCATIONS

FIGURE FROM HARGIS + ASSOCIATES, INC., 1991b.

Lithologic and hydrologic data collected from Lockheed Burbank facility monitor wells indicate the presence of three hydrogeologic units within the Younger Alluvium (Hargis, 1991a). These units are generally composed of coarse-grained material and are separated by finer-grained zones. The coarse-grained zones tend to have greater hydraulic conductivity than the intervening zones and are generally the zones which have been selected for monitor well screen intervals. These coarser-grained units are designated the A' zone, A zone, and B zone. The finer-grained units are designated the X zone and Y zone. The hydrostratigraphic zones in the Younger Alluvium dip at angles steeper than the slope of the water table. As a result, monitor wells completed at or near the water table may be screened in different zones depending on their location in and adjacent to Lockheed's Burbank facilities. These water table monitor wells are completed in the A' zone in the eastern portion of the study area, the X zone in the central portion of the study area, the A zone in the western portion of the study area, and the Y zone in the northwestern portion of the study area (Hargis, 1991a). The Older Alluvium has not been divided into discrete hydrogeologic units for the groundwater assessment. The A' zone appears to be saturated only in the eastern portion of the Lockheed Burbank facility area. The A and B zones, and Older Alluvium appear to be saturated throughout the Burbank facility area.

Water surface elevation measurements taken at Plant B-6 monitor wells in May 1991 indicate that the depth to groundwater is approximately 191 to 267 feet below ground surface (481 to 493 feet MSL) (Hargis, 1991b). Groundwater contours developed from water surface elevation measurements at shallow monitor wells (those wells completed in the A', X, A, and Y zones) and B-zone monitor wells indicate that the groundwater flow direction beneath the Lockheed Burbank facilities is generally south to southeast. May 1991 water surface elevation contours for the shallow monitor wells and B zone wells in the vicinity of the Lockheed Burbank facilities are shown on Figures 2-5 and 2-6.

SECTION 3

SITE BACKGROUND

Operations at the Plant B-6 facility are primarily administered by Lockheed Advanced Development Company (LADC). LADC (also known as the "Skunk Works") performs classified aircraft research, development, and assembly work, primarily for the U.S. Department of Defense. Many of the buildings at the Plant B-6 facility have restricted access and require LADC and U.S. Department of Defense clearance for entry. Aircraft final assembly has been the principal manufacturing activity at Plant B-6. Other operations performed at the plant include research and development activities, minor subassembly work, aircraft functional testing, and ground support equipment assembly, and flight operations. Supporting activities at Plant B-6 include cleaning and painting, minor tooling and welding, and parts and components machining. Primary and support activities require the use and storage of aircraft fuels, fuel oils and gasoline, paints, and chemicals such as solvents, acids, caustics, and plastic resins and hardeners. Chemical wastes such as waste oils and paints, spent solvents, plastic resins, and metal shavings are generated and temporarily stored at the site. This section of the report summarizes past construction and operational activities at the Plant B-6 site and presents a general description of chemical usage at the site. Results of the aerial photograph review are presented and previous investigations that have been conducted at the site are described.

3.1 SITE DESCRIPTION AND OPERATIONAL ACTIVITY OVERVIEW

Portions of the Plant B-6 site were first occupied by Lockheed Corporation in approximately 1940. The Plant B-6 area included a portion of the former Union Air Terminal runway number 1 and undeveloped land east and north of the airport runways. Initial Lockheed use of the site was for parking completed aircraft from other Lockheed facilities located adjacent to the airport. Aircraft at the Plant B-6 site underwent final preparations for delivery to the client. Building construction and expansions began in 1941, when Plant B-6 became a significant final assembly and flight support facility. The eastern portion of the site, which encompasses the Parcel 2 environmental assessment area, contained the majority of buildings associated with assembly and related activities, while the western portion was used more for flight line operations.

From 1941 to the late 1980s, a total of more than 80 buildings were constructed on the Plant B-6 site; approximately 65 buildings were constructed in the Parcel 2 area. Some older buildings were demolished prior to the construction of new buildings. Figure 3-1 shows former locations of Lockheed buildings and structures in relation to the current configuration of Parcel 2. Figure 3-2 and Table 3-1 present the construction dates of existing buildings at Plant B-6.

In the mid-1940s, the Plant B-6 site was divided in ownership between Lockheed Air Terminal (LAT), Lockheed Factory B, and the Defense Plant Corporation (Air Force Plant 14), a subsidiary of the federal Reconstruction Finance Corporation. The Parcel 2 area was owned by Lockheed Factory B and the Defense Plant Corporation. By 1973, Lockheed had taken over all of the government owned land on the site, with the government retaining ownership of four buildings in the northern portion of Parcel 2. Since that time, Parcel 2 has been composed of land owned by Lockheed California Company (CALAC), LASC, or LAT and land leased from LAT by CALAC, LASC, or LADC. With the exception of Buildings 332, 333, 338, and 339, which are owned by LAT, all buildings in Parcel 2 are currently owned by LASC or LADC.

Since operations began at Plant B-6, the facility has been committed almost exclusively to final assembly, flight line operations, and research and development activities associated with military aircraft. Beginning in the 1940s, Plant B-6 was used for final assembly of Hudson bombers, P-38 Lightning fighters, B-17 bombers, Constellation series aircraft, P-80/F-80 Shooting Star jet fighters, and P-2V Neptune anti-submarine patrol aircraft. Commercial and military versions of the Constellation, military P-2V's, and Model 188 Electra airliners were the primary aircraft produced at the site in the post-war period, with limited production of the U-2 reconnaissance aircraft. In the 1960s, the P-3 Orion supplanted the P-2V and production of the SR-71 reconnaissance aircraft began. In the 1970s, the S-3A Viking, a carrier-based anti-submarine patrol aircraft, underwent final assembly at Plant B-6 and production of P-3's and SR-71's continued. In the 1980s, the F-117A Stealth fighter was developed and partially assembled at Plant B-6. In the last few years, activities at the plant have decreased as projects have been transferred to other Lockheed facilities and as Lockheed has begun preparation for sale of the Plant B-6 property.

In support of aircraft final assembly and functional testing activities, facilities at Parcel 2 of Plant B-6 have been used to conduct operations of potential environmental concern such as fuel system and hydraulic system testing, painting, paint stripping, engine testing, metal fabrication, and metal finishing. The use of clarifiers, sumps, storage tanks, chemical waste storage areas, flight line blast fences,

electrical substations, and paint spray booths have been associated with operations in Parcel 2, and they are of particular interest as potential sources of soil contamination. Each potential source of chemical release to the ground is identified and discussed in the individual building summaries presented in Section 4.

3.2 GENERAL CHEMICAL USE PRACTICES

The assembly and testing of aircraft, aircraft parts, ground support equipment, and metal fabrication at the Parcel 2 portion of Plant B-6 has required the use and storage of a large variety of chemicals for operations such as fuel system testing, aircraft fueling, hydraulic system testing, metal finishing, cleaning, composites assembly, and painting. The environmental assessment investigation focuses on understanding chemical storage, handling, and disposal practices. Some of these practices are associated with specific buildings and are discussed in detail in the site inspection portion of this report. A general description of chemical use practices at Plant B-6 is, however, presented below.

Former aircraft flight line and final assembly operations utilized the majority of land encompassed by Parcel 2 of the Plant B-6 site. Currently, much of the former flight line areas are utilized as Lockheed employee and Burbank-Glendale-Pasadena Airport parking lots, while much of the final assembly operations, which are conducted in the buildings on the site, are being transferred to Lockheed's Palmdale, California and Marietta, Georgia facilities. Chemical use at the former flight lines and in the final assembly processes included aviation gasoline and jet fuel, aircraft hydraulic and engine oils, acids, caustics, and cleaning solvents. As part of aircraft fuel system check-out, fuel was occasionally spilled to the ground, sometimes in large quantities. Spilled fuel was typically washed off the area, usually to storm drains, to lessen the fire hazard and to reduce pavement damage. Spills of hydraulic fluids and engine oils were common on the flight lines. Metal fabrication and other final assembly processes commonly used solvents, acids, caustics, and hydraulic oil which may have drained into sand traps and unlined utility pits. More details on flight line and final assembly operations are presented in site and building discussions in Section 4.

The main chemical storage facility for Plant B-6 and other LASC facilities was located at Buildings 85 and 87 on Plant A-1 until 1987. Building 161 at Plant B-1 was constructed in 1987 and has been the major chemical storage location and chemical receiving facility since that time. Individual departments within Plant B-6 buildings maintain discrete stores of chemicals that are used on a daily or frequent basis. Chemicals for the Plant B-6 facility are received at the loading dock at Building 309 and are then delivered to three main storage areas located adjacent to Buildings 83 (solvents), 88 (oils), and 349 (acids and caustics). A large variety of paints, primers, adhesives, lacquers, thinners, epoxies, resins, cements, hardeners, fuels, greases, oils, waxes, lubricants, and sealants have been or are currently used

on-site and are generally stored in small-volume containers. The current use of chemicals at the Plant B-6 facility is much reduced in volume and variety compared to when the plant was at full production capacity.

Chemical storage noted in and around Plant B-6 buildings is discussed in the individual building summaries presented in Section 4. In general, the majority of chemical use at Parcel 2 of the B-6 facility consisted of fuels, oils, solvents, paints, acids, caustics, refrigerants, and compressed gasses. Fuels used in Parcel 2 included automobile gasolines, aviation gasoline, Jet A, JP-4, JP-5, JP-7, JP-8, and thermally stable jet fuel. The types of oils used included conventional motor oils, turbine lubricating oils, hydraulic system oils, and rust preventative oils. Painting at Parcel 2 has included spray painting, from both aerosol cans and spray guns, and brush application. Paint constituents have evolved through the years that Plant B-6 has been in operation. From the plant's start to the 1960s, oil-based, lacquer, and synthetic paints were used. Polyurethane and epoxy paints were used from the early 1970s through the mid-1980s. Latex and water-based paints have been used since approximately 1986. Minor amounts of lacquers, oil-based and epoxy paints are still used at the facility for special applications. A wide variety of solvents have been used at Plant B-6, Parcel 2, including carbon tetrachloride, various chlorofluorocarbons (Freons), isopropyl alcohol (IPA), methylene chloride, methyl ethyl ketone (MEK), methyl isobutyl ketone (MIBK), petroleum naphtha, Stoddard solvent, 1,1,1-trichloroethane (TCA), tetrachloroethylene (PCE), trichloroethylene (TCE), and xylene. Refrigerants used at Parcel 2 include chlorofluorocarbons from several manufacturers, the most common being DuPont (Freons). Table 3-2 lists the various Freon species and their chemical compositions. Compressed gasses used in large quantities at Parcel 2 include oxygen, nitrogen, and acetylene.

Air conditioning units at the facility are generally maintained by facility maintenance personnel; refrigerants used are noted above. Occasionally, air conditioning units are sent off-site for major repairs. An outside contractor, Chem Pro, provides chemical use services for cooling towers and boilers. Water treatment chemicals currently used in cooling towers may include sodium bisulfide, sulfamic acid, polyacrylate, organophosphonate, orthophosphate, quaternary amines, and chlorine. Prior to the early 1970s, chromium compounds were reportedly used in cooling towers at the site.

3.3 AERIAL PHOTOGRAPH REVIEW

Aerial photographs of the Lockheed Plant B-6 site were reviewed to provide a history of land use practices and to identify past potential source areas of environmental concern on and adjacent to the Parcel 2 site. Both vertical and oblique photographs from several different collections were reviewed.

TABLE 3-2

VARIOUS FREON SPECIES AND THEIR
CHEMICAL COMPOSITIONS

<u>Product Name</u>	<u>Chemical Composition</u>
Freon 11	trichlorofluoromethane
Freon 12	dichlorodifluoromethane
Freon 13	chlorotrifluoromethane
Freon 14	tetrafluoromethane
Freon 21	dichlorofluoromethane
Freon 22	chlorodifluoromethane
Freon 113 (Freon (R) TF)	1,1,2-trichloro-1,2,2- trifluoroethane
Freon 114	1,2-dichloro-1,1,2,2- tetrafluoroethane
Freon 502	monochlorodifluoromethane and chloropentafluoroethane

Vertical aerial photographs taken in 1937 through 1986 that were compiled in two reports prepared by Lockheed (LEMSCO, 1986; LESC, 1988a) were reviewed. The Fairchild Aerial Photography Collection at Whittier College and at the University of California, Los Angeles; the Teledyne Aerial Photography Collection at the University of California, Santa Barbara; and the aerial photography collection at California State University, Northridge were examined and vertical aerial photographs taken in 1928 through 1988 were reviewed. Generally, the scale of the photographs from these collections is such that details smaller than automobiles cannot be distinguished. The photographs in the Fairchild Collection at Whittier college were examined stereoscopically, since stereo pairs were available. The remainder of the photographs for Plant B-6 were examined individually.

Oblique aerial photographs taken in 1920 through 1969 from the Spence Collection at the University of California, Los Angeles; the Lockheed Public Information office; the Lockheed file room located in Building 76 at Plant A-1; and the personal collection of Mr. Al Weaver (LADC Facilities Engineer, former LASC employee) were also reviewed. The photographs from the Lockheed Public Information office, the file room, and Mr. Al Weaver are of a scale such that 55-gallon drums can be distinguished.

This aerial photograph review concentrates on identification of past potential contaminant sources in the eastern portion of Plant B-6, within and adjacent to Parcel 2. The aerial photograph review discussion is segregated into time intervals that have been chosen to include a period of construction activity followed by a construction hiatus (1941 to 1952; 1953 to 1961; 1962 to 1977; and 1978 to 1988). Aerial photographs taken prior to 1941 show the former Union Air Terminal runway number 1 occupying a portion of the western section of Plant B-6, on Parcel 1, and the remaining area of Plant B-6 used for agriculture and airport parking. Aerial photographs covering the years 1989 through 1991 were not available for review.

The predominant features of environmental concern observed on the aerial photographs are dark discolorations, which appear to be staining, adjacent to buildings where aircraft maintenance and testing was performed and adjacent to flight line and blast fence areas. Aircraft maintenance, aircraft fuel and oil system testing, final assembly, flight operations, and other flight line and blast fence activities, which are described in more detail in Section 4, appear to be the major contributors to staining noted in Parcel 2. Figure 3-3 shows the areas of pronounced discoloration and staining within and adjacent to Parcel 2 that were noted in the aerial photograph review. The figure encompasses the area south of Parcel 2 that was owned and occupied by LAT from approximately 1941 to the mid-1980s. The history of activities in this area is described in Section 4. Several chemical storage areas external to Parcel 2 buildings have also been identified on the aerial photographs. A description of each of these storage areas is presented in the Section 4 site inspection discussions for the pertinent buildings.

3.3.1 1941 to 1952

Aerial photographs taken in 1941 indicate that Parcel 2 consisted mostly of undeveloped land and agricultural land used for dry-land grain crops, dry-land grazing, and vineyards. In the southern portion of Parcel 2, land use in the vicinity of former farmstead buildings (noted in pre-1941 photographs) appears to be associated with the aircraft staging (Hudsons and P-38s). Aircraft staging was observed on the 1941 photos just west of Parcel 2 and at the airport hangars just south of Parcel 2. The aircraft staging areas located off of the Parcel 2 property appeared to be asphalt paved. Two Hudson bombers were parked in an unpaved area on the western edge of Parcel 2, west of the current location of Building 332. Several barns, sheds, and other associated agricultural buildings were located approximately at the present location of Buildings 82 and 352. A few small buildings were noted at the present location of Buildings 355 and 356.

From 1942 through 1945, the Parcel 2 area underwent significant development, with construction of many of the more important buildings, including Buildings 82, 83, 88, 304, 309, 330, 331, 332, 333, as well as run-up sheds and blast fences (Figure 3-1). From 1946 through 1952, there was virtually no building construction activity at Parcel 2.

In aerial photographs taken in 1942, Building 304 is present, along with dozens of P-38s and Hudsons parked on the paved area around the building.

Buildings 82, 83, 330, and 331 are present on photographs taken in 1944, as is a blast fence, west of Building 331. In addition to P-38s parked in the southern portion of Parcel 2, several B-17s are parked at this blast fence and adjacent to Building 82.

Aerial photographs from 1945 show Parcel 2 to be paved, with the exception of areas east of Buildings 82 and 83 and north and east of Building 88. In 1945, blast fences were constructed at the following locations: around the paved area at the eastern end of Building 82; immediately north and west of the present location of Buildings 349 and 352; north of Buildings 330/331/332; west and north of the run-up sheds that were located south of Buildings 330 and 333; and between Building 338 and the northern side of Building 309.

In a January 1945 photograph, an unpaved area of approximately two acres in the northeast corner of Parcel 2 was noted with mounds of soil and piled debris. In a photograph taken later in 1945, the mounds and debris have been removed and the area is being used as an unpaved parking lot. A service station is visible at the northeast corner in late 1946 aerial photographs.

In aerial photographs taken from 1942 through 1952, operations in the vicinity of the blast fences, run-up sheds, and outside of the buildings appear to consist of aircraft final assembly, pre-flight and flight operations, and maintenance of the P-38, Hudson, B-17, Constellation, and P-2V aircraft.

A 1945 aerial photograph shows evidence of a firing tube covered by mounded earth and three small concrete bomb shelters that were located just north of Building 309. Building 309 facility drawings indicate the firing tube was approximately 70 feet long and 8 feet wide.

Photographs taken in 1951 show numerous P-51 Mustangs outside of Buildings 330/331/332 and on the south sides of the N1 and S1 East blast fences, which are shown on the western edge of Parcel 2 on Figure 3-1.

Moderate to heavy dark-colored staining is evident on paved areas of Parcel 2 from 1942 through 1952. Staining is evident on the asphalt areas around Building 304 on aerial photographs taken in 1942 and 1944. Most of the staining is outside the Parcel 2 boundary, west and south of Building 304. Aerial photographs taken in 1945 indicate the presence of heavy staining along the north side of the eastern portion of the N1 blast fence and localized heavy staining between Buildings 330/331/332 and Building 83. The 1945 photographs also show evidence of moderate to heavy staining around the flammable material storage sheds west of Building 83 and fluid draining from the west end of these sheds into the drainage channel south of Building 83. Aerial photographs from the period of 1948 through 1951 indicate the presence of heavy staining south and southeast of Building 82, east of Building 83 on the Pacific Airmotive Corporation property, north of the N1 blast fence, south and west of Hangar 8 (located southeast of Building 304), and in localized areas south of Blast Fence 331B, located west of the run-up sheds. From 1948 through 1951, additional staining was noted in the following areas: moderate to heavy staining in the vicinity of the current Building 349; minor to moderate staining between Buildings 330/331 and the run-up sheds and Blast Fence 330B and 331B; and minor staining between Buildings 304 and 309. Photographs taken in 1952 show evidence of moderate to heavy staining south of Buildings 330/331/332, and minor staining north of Building 82.

3.3.2 1953 to 1961

During 1953 and 1954, building construction in Parcel 2 resumed with the construction of eight buildings, including Building 310. Aerial photographs from 1953 to 1961 indicate that Constellation and P-2V aircraft were the predominant aircraft being built and tested at Parcel 2. Aerial photographs from 1954 indicate that the run-up sheds from south of Building 330 had been removed. In 1957 photographs, Building 352 was noted in its present configuration rather than two smaller structures noted in earlier photographs.

As with earlier photographs, significant staining was noted during the 1953 to 1961 time period. On 1953 and 1954 aerial photographs, moderate to heavy staining is visible at the blast fences and adjacent to several buildings. Heavy staining is also noted on the Pacific Airmotive Corporation property immediately east of Building 83. Staining is visible in the storm drain channel south of Building 83 and along the south side of Building 331. Storage of drums and miscellaneous parts and equipment was noted on the photographs along the blast fence north of Buildings 330/331/332. These three buildings appeared to be occupied by Pacific Airmotive Corporation because the company name is visible on the buildings on the aerial photographs.

New paving is visible between blast fences N1 and N2 and south of N1 on aerial photographs from 1954. Staining is present on the new pavement at the blast fences. The photographs from 1954 suggest that the firing tube (north of Building 309) has been removed, leaving an undeveloped dirt lot. Heavy staining is visible at the flight line blast fence south of Building 304 southwest of the Parcel 2 boundary.

Aerial photographs dated from 1955 to 1961 show evidence of staining at the flight line blast fences. Staining is also evident north of Building 309 at an aircraft parking and maintenance area.

3.3.3 1962 to 1977

Aerial photographs from 1962 to 1966 indicate that construction was completed on Buildings 311, 311A, 322, 325, 326, and 341. By 1962, substantial additions had been completed on Building 352. The service station previously noted at the corner of San Fernando Road and Hollywood Way was removed between 1965 and 1968. Facility drawings from 1967 to 1977 indicate no new buildings were constructed on Parcel 2. During the 15-year period of 1962 to 1977, flight line operations at Plant B-6 declined significantly. Aerial photographs taken during this period show Constellations and P-3 aircraft at blast fences in the early 1960s, with P-3s and S-3As predominating the later part of this period. Virtually all flight line operations and aircraft parking took place outside of the Parcel 2 area, the principal exception being east of the N2 blast fence.

Aerial photographs taken in 1962, 1964, and 1968 indicate the presence of heavy staining east of the N2 blast fence and north of the eastern portion of the N1 blast fence. Minor stains (possibly residual stains from previous operations) are present at these two locations on photographs taken in 1972, 1975, and 1977.

3.3.4 1978 to 1988

Aerial photographs from 1978 to 1988 indicate that numerous small and portable buildings, as well as Buildings 84, 315 (the Cafe) and 349, were constructed. By 1986, the N1 and N2 blast fences were removed and the area north of the eastern

portion of the former N1 blast fence was being used for miscellaneous storage. The P-3 was the last aircraft to utilize the flight line areas at Plant B-6; the P-3 program was discontinued at the plant in the mid-1980s.

Aerial photographs taken from 1978 to 1983 indicate the presence of minor to moderate staining south and east of Building 304, off of Parcel 2, at the flight line blast fences. Aerial photographs taken from 1984 to 1988 do not show significant staining at the Plant B-6 site.

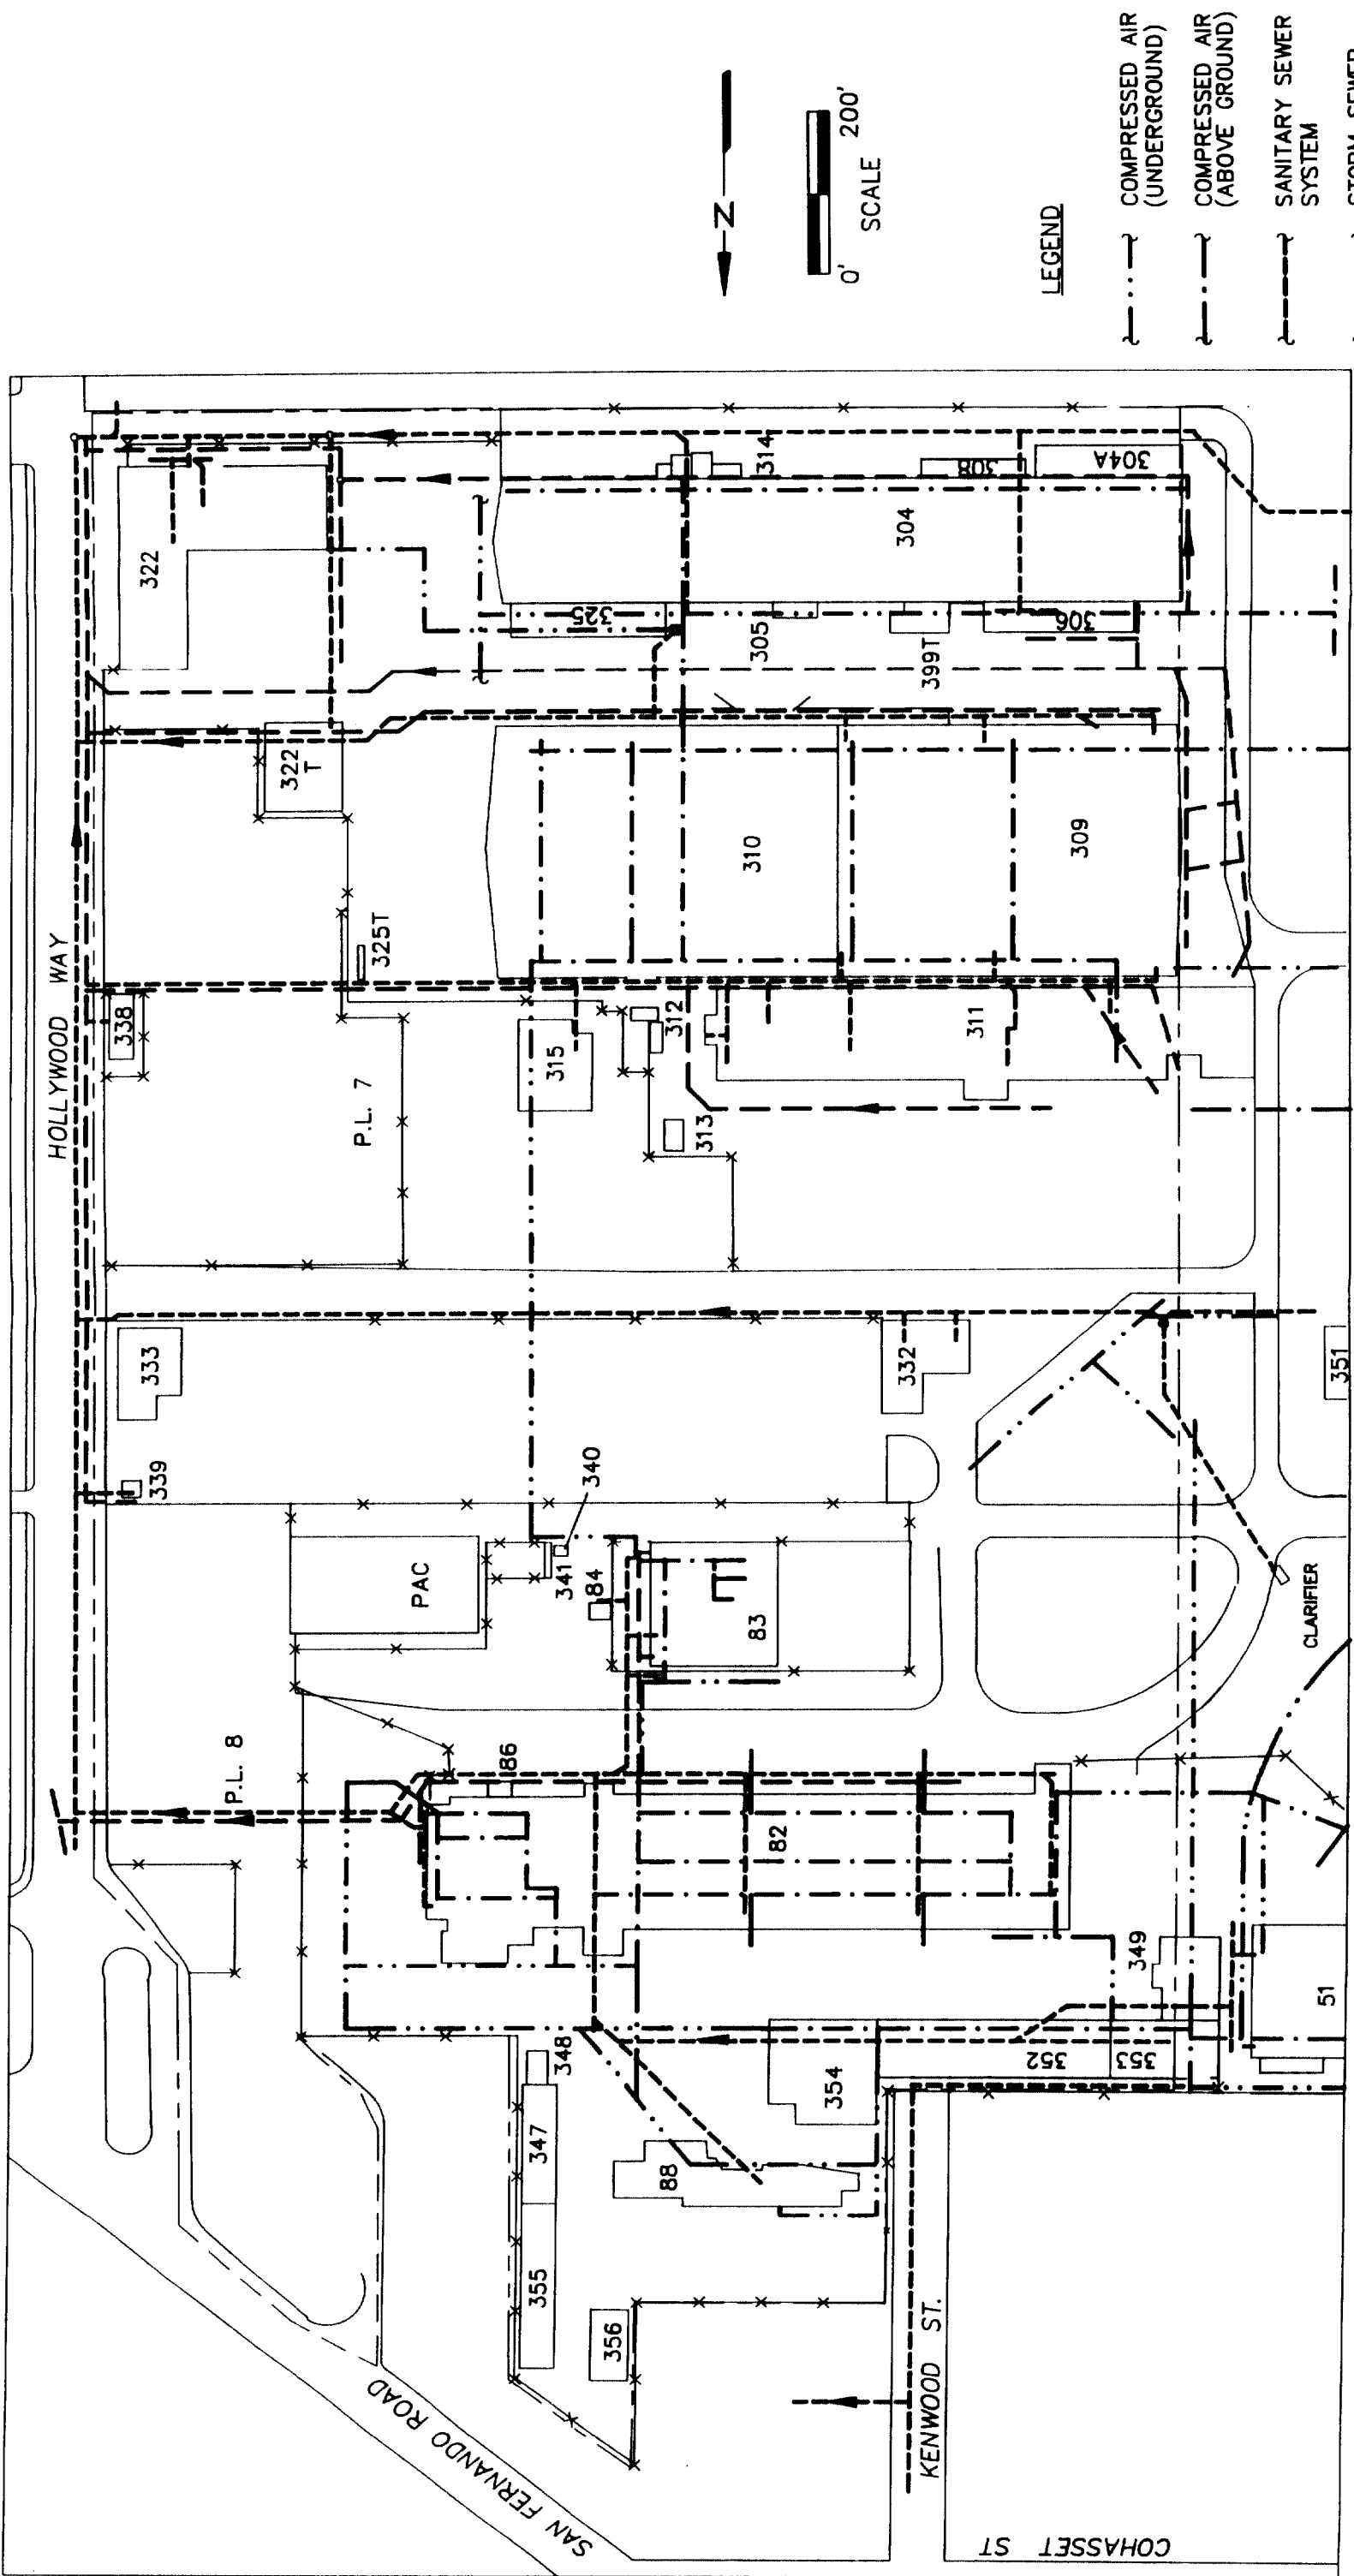

3.4 STORM DRAIN, SANITARY SEWER, AND COMPRESSED AIR SYSTEMS

The storm drainage system present at Plant B-6 consists of open storm drain channels and a subsurface storm sewer system. The storm drain channels may receive runoff directly from overland flow or from catch basins that discharge to the channels. The storm sewer receives discharge from storm drain channels, catch basins, and from roof downspouts. A review of available storm drain drawings for Plant B-6 was performed; however, the drawings located did not allow definition of the entire subsurface system. The locations of the identified drainage channels and subsurface piping in the Parcel 2 area are presented on Figure 3-4. This figure was compiled from Lockheed facility drawings, with minor modifications based on field observations. The design drawing review indicated that historical on-site practices included clarifiers discharging to the storm drain system, as well as to the sanitary sewer system.

Surface runoff from most of the northern half of Parcel 2 (that part approximately north of Parking Lot 7) drains overland to an open drainage channel that lies between Buildings 83 and 333. The drainage channel empties into a 60-inch city main that runs south along Hollywood Way. Much of the southern portion of Parcel 2 drains into catch basins and trenches on the northern side of Buildings 311, 309, 310, and 304. These catch basins and trenches discharge to three underground conduits that run east to the 60-inch city main at Hollywood Way.

The on-site sanitary sewer system receives discharge from rest rooms, sinks, floor drains, and clarifiers. The locations of sanitary sewer lines on Parcel 2 were identified from the facility design drawing review and are shown on Figure 3-4. As with the storm sewer, this figure may not present the complete Parcel 2 sanitary sewer system. The sanitary sewer system laterals discharge to city mains located beneath Hollywood Way and Kenwood Street. The laterals consist of vitrified clay pipe and cast iron pipe that range up to nearly 50 years in age. Three sewage lift-stations are located at the facility, one about midway between Buildings 332 and 351, one in Building 322, and one in Building 352B.

FIGURE 3-4
PARCEL 2 UTILITIES

In addition to the sanitary sewer system, there are several active and inactive dry wells, and cesspools on Parcel 2 of the Plant B-6 site. An inactive cesspool is located at Building 352. Inactive dry wells are located at Buildings 349, 353 and former Buildings 330 and 331 and active dry wells are located at Building 322. These features are described in more detail in the specific building discussions in Section 4.

Compressed air is supplied throughout Plant B-6 by compressors located at the blast fence north of Building 357 and at Building 83. Compressed air storage tanks (receivers) are located at various buildings and locations throughout Parcel 2. Figure 3-4 shows the location of compressed air lines at Parcel 2.

The information provided by the location of dry wells, cesspools, and the storm drainage, sanitary sewer, and compressed air systems at Parcel 2 potentially will assist in preparation of the work plan for the Phase II site investigation. This information may also assist in the evaluation of data obtained through the Phase II site investigation, such as determination of potential contaminant migration pathways.

3.5 PREVIOUS AND ONGOING SITE INVESTIGATIONS

Environmental investigations have been conducted at Plant B-6 and surrounding Lockheed Burbank facilities since 1983, when LASC responded to a Regional Water Quality Control Board (RWQCB) request to inventory underground storage tanks at all of their Los Angeles County facilities. Since that time, numerous site investigations have taken place in response to regulatory compliance guidelines, suspected chemical releases, and LASC environmental policy. These site investigations can be grouped into three classes: groundwater investigations; underground storage tank investigations; and other investigations, including a transformer survey, a soil vapor survey, a potentially responsible party (PRP) survey, and a records search. The investigations at the Lockheed Burbank facilities have resulted in: 1) identification of several areas of potential environmental concern; 2) characterization of underground storage tank integrity which resulted in abandonment or removal of selected tanks; 3) cleanup of chemically impacted soil at various locations; 4) identification of groundwater flow characteristics and quality; and 5) initiation of groundwater cleanup efforts.

Previous and ongoing site investigations at the Lockheed Burbank facilities and at Plant B-6 in particular are briefly summarized below. More detailed descriptions of investigations at Plant B-6 facilities are presented in the individual building site inspection sections of this report, where applicable.

3.5.1 Groundwater Investigations

Groundwater investigations have been ongoing at Plant B-6 and other Lockheed facilities in the Burbank area since 1986. To date, over 100 groundwater monitoring wells, one extraction well, and one recharge well have been installed within or adjacent to the Lockheed Burbank facilities. Three distinct phases of groundwater characterization activities have been completed and a fourth phase is currently underway. Phases I and II of the groundwater investigations were undertaken in response to the Lockheed 1984-1985 underground storage tank leak detection program, which identified areas of soil contamination and potential sources of groundwater contamination. Phase III and Phase IV groundwater investigations were initiated in response to LASC's site-wide Comprehensive Site Assessment and Remediation Program and in compliance with the December 1987 RWQCB Cleanup and Abatement Order No. 87-161. A comprehensive review of groundwater investigation activities conducted through February 1991 is provided in the February 28, 1991, Hargis and Associates, Inc., "Interim Groundwater Assessment Report, Volume I - Text, Tables, and Illustrations." A brief summary of the work which has been performed is presented below.

The Phase I groundwater investigation was conducted in 1986 and consisted of installing and sampling 12 multiple-screened monitoring wells. Well installation and sampling was performed by Gregg and Associates, Inc. (Gregg and Associates, 1987). Sampling was conducted by isolating screened intervals with inflatable packers and collecting samples with a submersible pump. A total of 111 samples were collected, including one sample from each of the 88 screened intervals and 23 duplicate samples for quality assurance/quality control (QA/QC) purposes. Thirty-seven of the samples were analyzed for volatile organic compounds (VOCs; EPA Method 624); base/neutral and acid extractable compounds, including pesticides and PCBs (EPA Method 625); priority pollutant metals; cyanide; phenols; total dissolved solids; conductivity; and general minerals. The remaining seventy-four samples were analyzed for VOCs (EPA Method 624); California Assessment Manual (CAM) metals; cyanide; total organic carbon (TOC); and general minerals. Sample results showed elevated concentrations of PCE and TCE in groundwater underlying Plants A-1, B-1, and B-6 and relatively low levels beneath Plant C-1 (Gregg and Associates, 1987). PCE and TCE were found at concentrations of up to 590 and 260 micrograms per liter ($\mu\text{g}/\text{L}$), respectively, beneath Plant B-6. In general, the shallowest sampled saturated interval contained the highest levels of PCE and TCE. Other VOCs were detected at relatively low concentrations (below Department of Health Services Recommended Drinking Water Action Levels). Base/neutral and acid extractable compounds, pesticides, PCBs, and metals were not detected (Gregg and Associates, 1987).

The Phase II work was conducted in 1987 and consisted of installing four additional multiple-screened monitoring wells and sampling all 16 wells. The work was performed to verify initial groundwater analytical data and to assess groundwater quality immediately upgradient of LASC facilities. Gregg and Associates performed the well installation and sampling. The groundwater sampling technique was identical to the Phase I methodology. A total of 142 samples, 112 from Phase I wells and 30 from the four Phase II wells, were collected from discrete depth intervals and were analyzed for VOCs using EPA Method 624. Sample results showed PCE and TCE concentrations up to 500 and 260 $\mu\text{g/L}$, respectively, in Plant B-6 wells. In general, the second sampling round of Phase I wells verified the presence of elevated concentrations of PCE and TCE beneath Plant A-1, B-1, and B-6, and relatively low concentrations of VOCs beneath Plant C-1 (Gregg and Associates, 1988). Sampling of Phase II wells showed PCE concentrations up to 43,000 $\mu\text{g/L}$ and TCE concentrations up to 7,800 $\mu\text{g/L}$, at monitor well B-1-MW9, located approximately 2,000 feet upgradient of Plant B-1, between Plants B-1 and B-6. Phase II sampling of all wells also indicated the likelihood of single or multiple sources of PCE and TCE contamination to groundwater upgradient of the Lockheed Burbank facilities (Gregg and Associates, 1988).

The Phase III investigation was conducted in 1988 and included installing an additional 24 single-screened groundwater monitoring wells in eight 3-well clusters across the LASC-Burbank facilities. Well depths ranged from 167 to 665 feet below ground surface. Groundwater was sampled from all 40 monitoring wells for analysis of VOCs using EPA Methods 601 and 602 or 624; semi-volatile compounds using EPA Method 625; major ions; and total dissolved solids. A total of 140 samples were collected for laboratory analysis from the 16 multiple-screened and 24 single-screened wells. Groundwater samples were obtained using a stainless steel positive displacement piston pump isolated by rubber well seals positioned above and below each sampled interval. URS Consultants, Inc., supervised the installation of the eight 3-well clusters (URS, 1988a; URS, 1988b). The Mark Group Engineers and Geologists, Inc., performed the groundwater sampling. Sample results indicated elevated PCE and TCE concentrations in groundwater underlying the northern (Plant B-6) and southeastern (Plant B-1) portions of the LASC-Burbank facilities, and relatively low levels underlying the western portion of the area (Plant C-1) (The Mark Group, 1988). PCE and TCE were found in concentrations up to 9,578 and 3,142 $\mu\text{g/L}$, respectively. Both PCE and TCE levels were found to decrease with depth. The Phase III work also included installation of a 1,100 gpm extraction well for groundwater remediation at Plant B-1, Building 175 (URS, 1988c). Extracted groundwater is treated by steam-stripping and is then discharged to the storm drain or recharged to the aquifer system. Recharge well LIW-1 is located in the southeast portion of Plant B-1.

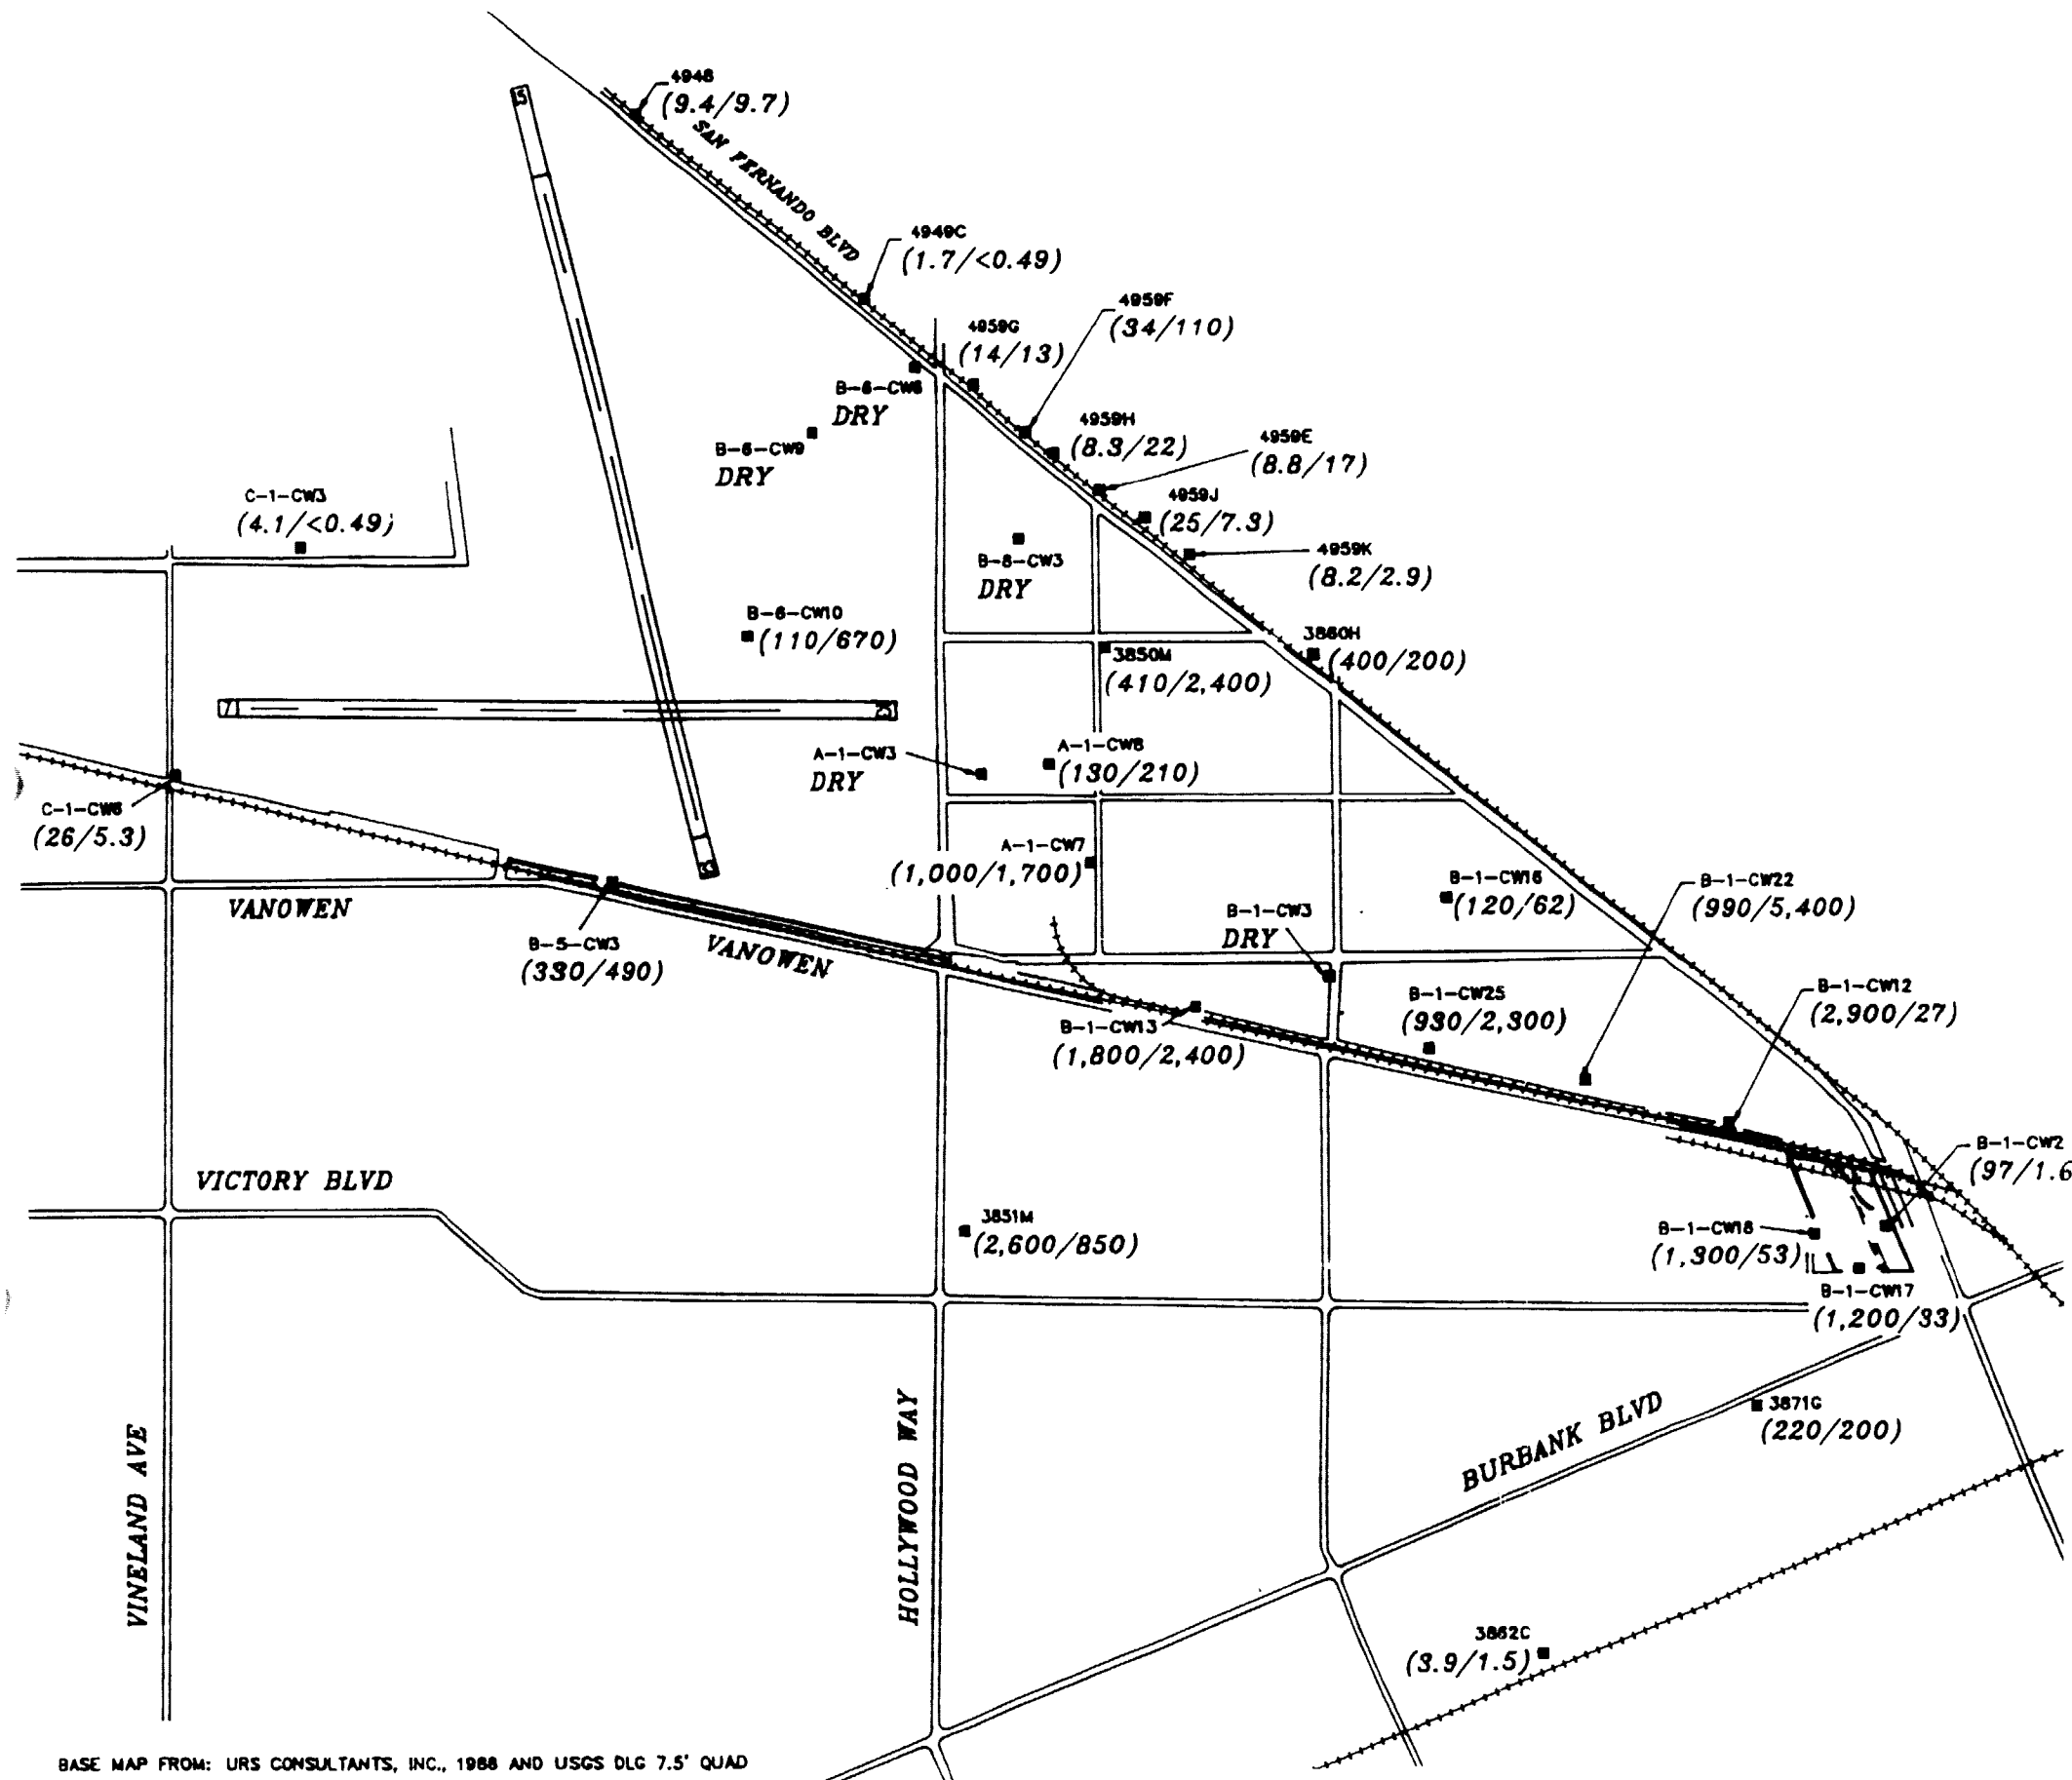

The Phase IV groundwater investigation was initiated in 1988 with the installation and sampling of 23 single-screened groundwater monitoring wells and one multiple-screened observation well near the extraction well at Plant B-1, Building 175. Phase IV work also included converting 15 multiple-screened wells to single-screened wells; installing dedicated sampling equipment in 38 of the 40 Phase I, II, and III wells; and sampling 38 of 40 Phase I, II, and III wells. URS supervised the monitor well installations (URS, 1990a). Radian Corporation performed the sampling of the Phase I, II, III, and IV monitoring wells (Radian Corporation, 1989). In 1990, an additional 20 monitor wells were installed by Hargis and Associates as part of the ongoing Phase IV investigation.

Phase IV groundwater sampling has included analysis for VOCs using EPA Methods 8010/8020, and 8240/8260; trace metals; major ions; and nitrate. Analytical results from the Phase IV sampling conducted between January and February 1991, show elevated concentrations of PCE and TCE in groundwater beneath the Lockheed Burbank facilities (Hargis, 1991c). PCE and TCE detected in groundwater samples from Lockheed monitor wells completed at or just below the water table have concentrations up to 5,400 and 2,900 $\mu\text{g/L}$, respectively, in the A' zone; up to 2,400 and 1,800 $\mu\text{g/L}$, respectively, in the X zone; and up to 1,400 and 2,600 $\mu\text{g/L}$, respectively, in the A zone. PCE and TCE are detected in concentrations up to 120 and 54 $\mu\text{g/L}$ in B zone monitor wells (Hargis, 1991c). A description of the distribution of TCE and PCE in the water table, A-, and B-zones beneath the Lockheed Burbank facilities is presented below.

The distribution of TCE and PCE in the water table is shown on Figure 3-5. The figure reflects data collected in January and February 1991. As shown, TCE is detected in concentrations up to 410 $\mu\text{g/L}$ and PCE is detected in concentrations up to 2,400 $\mu\text{g/L}$ east of Plant B-6, at well 3850M. The distribution of TCE and PCE in the A zone beneath the Lockheed Burbank facilities is shown on Figure 3-6. As shown, TCE is detected in concentrations up to 110 $\mu\text{g/L}$ and PCE is detected in concentrations up to 670 $\mu\text{g/L}$ beneath Plant B-6 at well B-6-CW10. The distribution of TCE and PCE in the B zone beneath the Lockheed Burbank facilities is shown on Figure 3-7. As shown, TCE is detected in concentrations up to 2.1 $\mu\text{g/L}$ and PCE is detected in concentrations up to 5.2 $\mu\text{g/L}$ beneath Plant B-6 at wells B-6-CW14 and B-6-CW8, respectively. The TCE and PCE concentrations in the B zone are low compared to the water table and A zone.

Additional Phase IV work is being conducted at Lockheed's Burbank plants to characterize downgradient groundwater quality and to obtain data for the design of groundwater remediation facilities.

3.5.2 Underground Storage Tank Investigations

Underground storage tank investigations conducted at the Plant B-6 facility are discussed below and include the 1984/1985 Underground Storage Tank Leak Detection Program and the Underground Storage Tank Compliance Program.

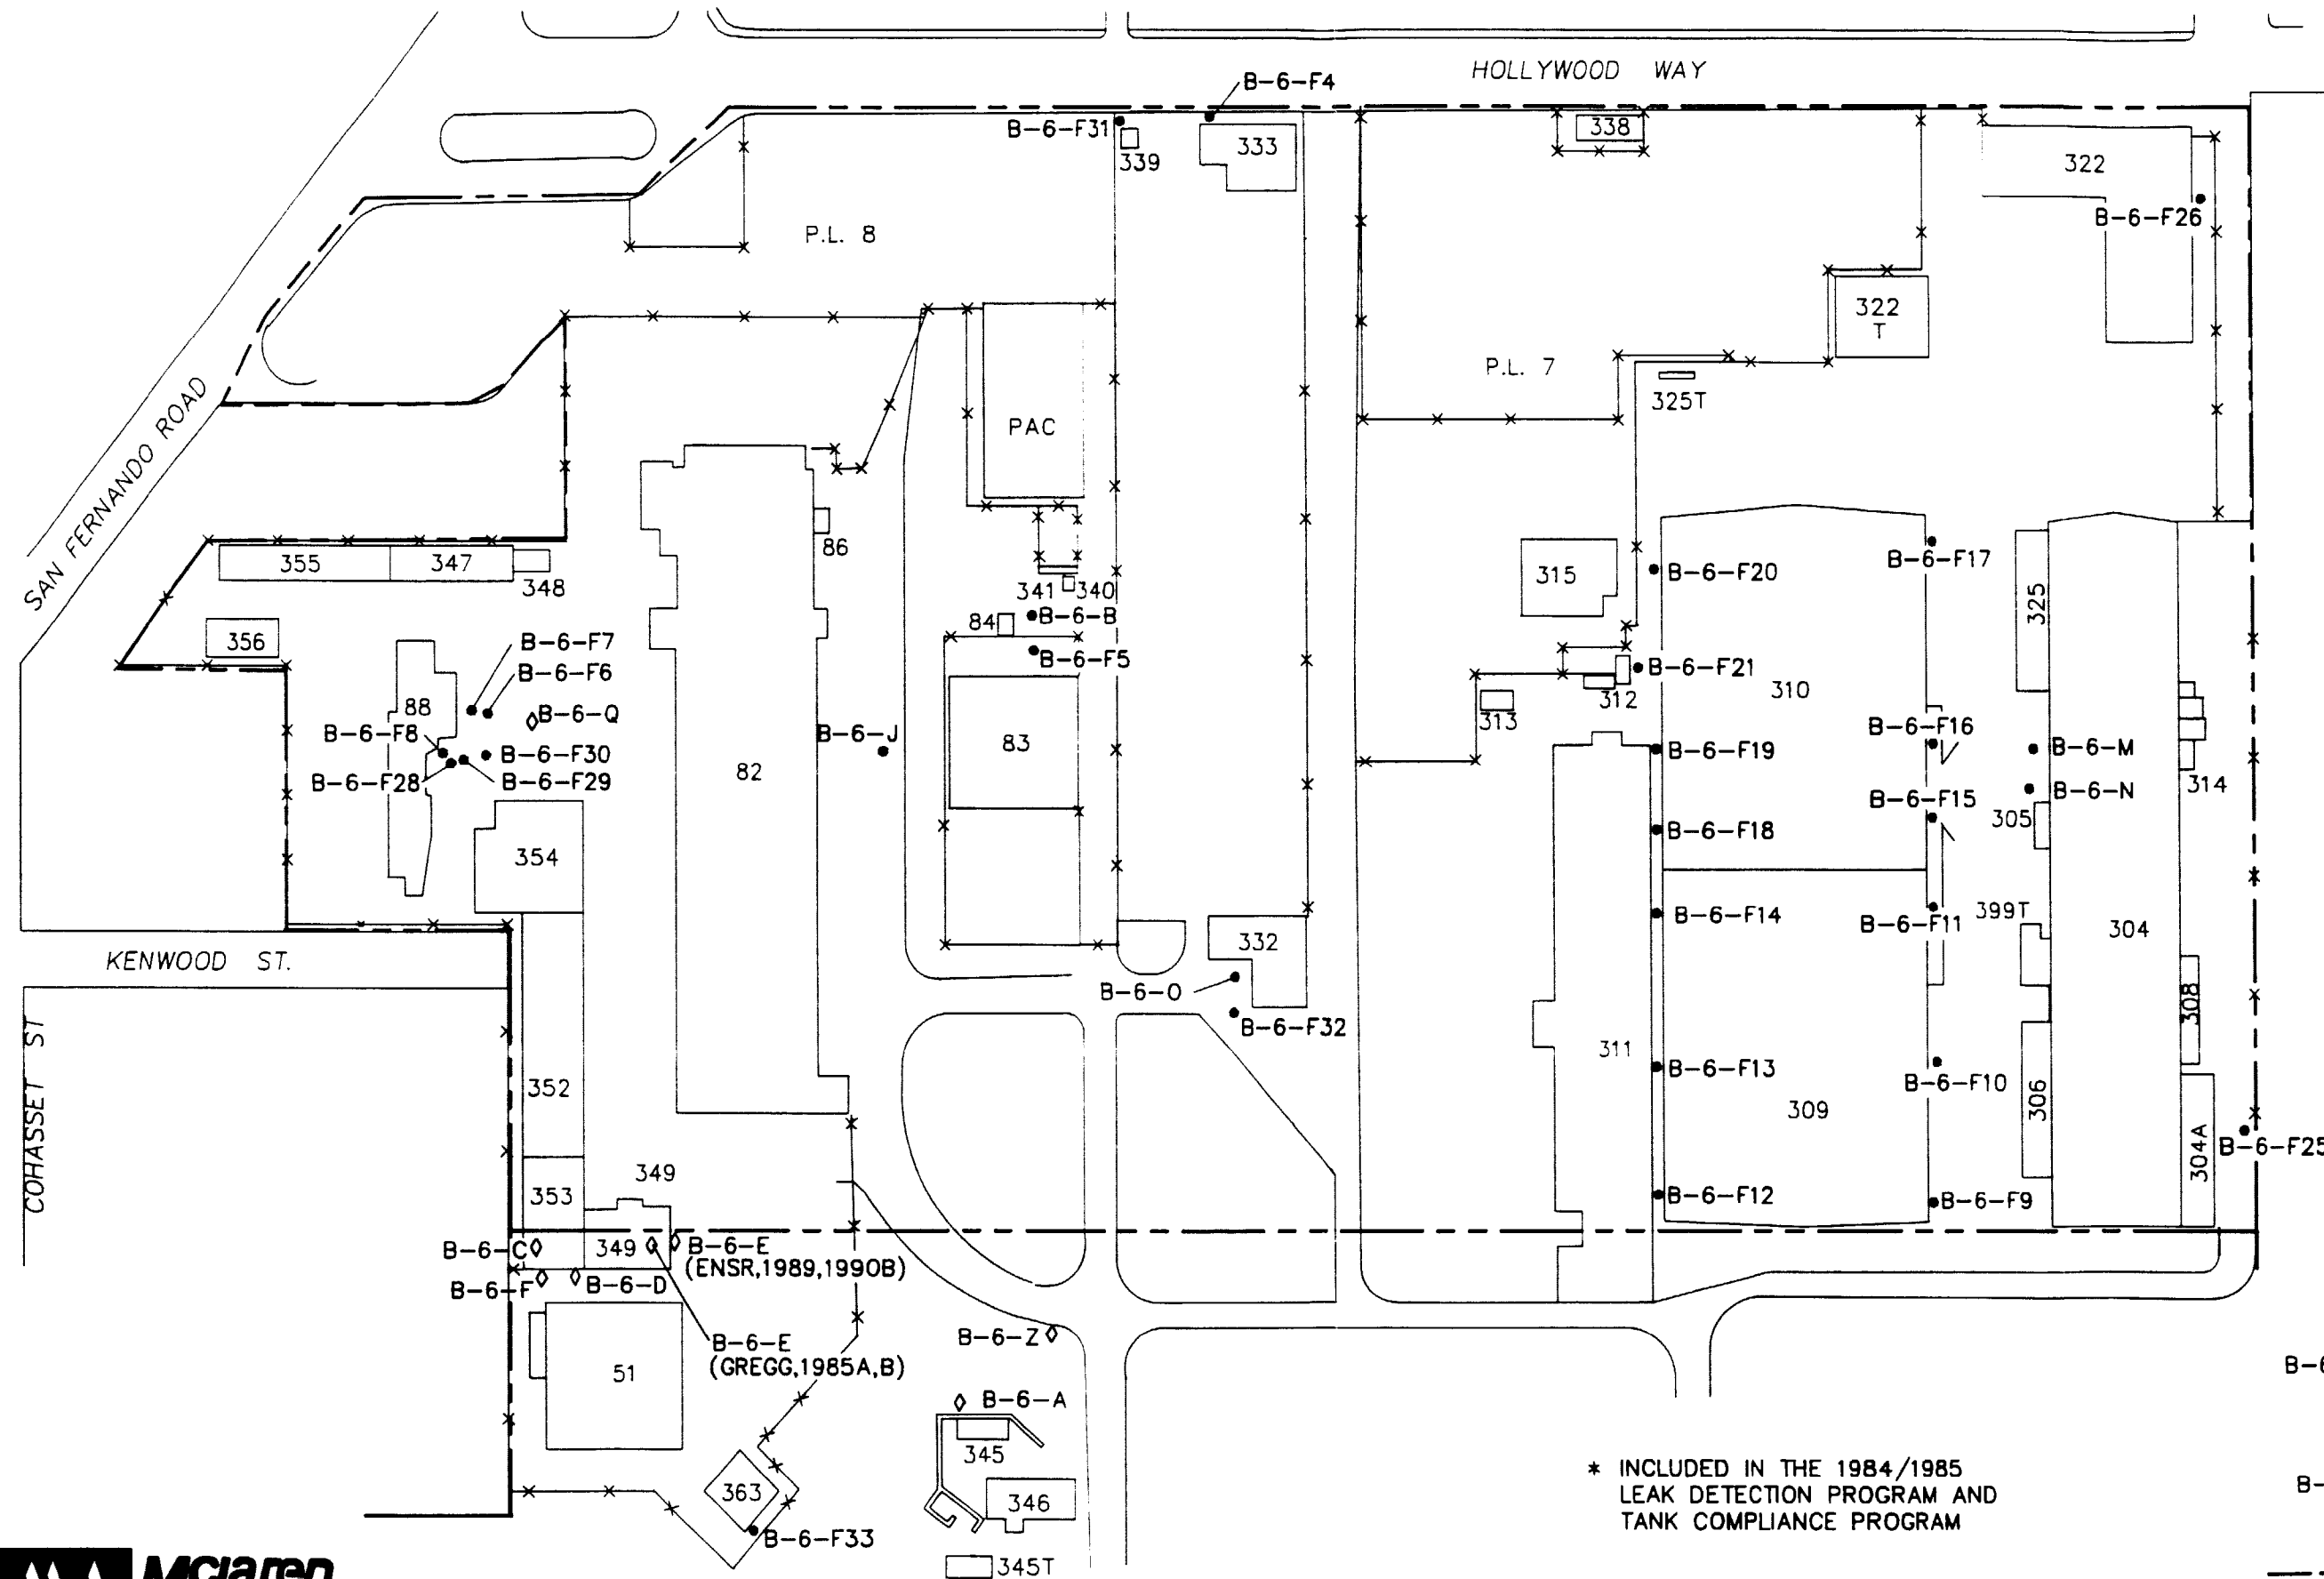

3.5.2.1 1984/1985 Underground Storage Tank Leak Detection Program

In September 1983, Lockheed submitted an inventory of underground storage tanks at all of their Los Angeles County facilities to the RWQCB. The inventory included a total of 3 aboveground tanks and 28 underground tanks, sumps, and clarifiers at the Plant B-6 site. In November 1983, the RWQCB informed Lockheed that they would be required to conduct an underground storage tank leak detection program to comply with the RWQCB's Groundwater Protection Program. An additional seven tanks at the LAT Fuel Tank Farm are located within the Plant B-6 area west of Parcel 2. These tanks are administered separately by LAT, and they are discussed in the Regulatory Agency Review section of the Plant B-6 Parcel 1 Environmental Assessment Report.

The LASC leak detection program was conducted in 1984 and 1985 by Gregg and Associates, Inc. (Gregg and Associates 1985a, 1985b). A total of 37 underground tanks, 6 sumps, and 7 clarifiers were investigated at Plant B-6, which included those identified in the 1983 inventory, with the exception of the three aboveground tanks. Of the 50 facilities which were investigated at Plant B-6, 25 fuel tanks and 10 non-fuel tanks, sumps and clarifiers are located within the Parcel 2 area. The locations of these 35 underground tanks, sumps, and clarifiers are shown on Figure 3-8. Table 3-3 summarizes the facility locations, construction information, current or former use, contents, and current status.

The leak detection program generally consisted of drilling and sampling soil borings adjacent to most underground tanks, sumps, and clarifiers identified at the Plant B-6 site. Vapor monitoring wells and/or suction lysimeters were installed adjacent to most facilities which were not scheduled for removal or abandonment in place at the time of the 1984/1985 leak detection program. Liquid samples were collected for analyses from non-fuel tanks, sumps, and clarifiers if the contents were uncertain. The primary objective of the program was to assess the presence or absence of leaks, and not necessarily to evaluate the nature and extent of soil contamination, if encountered.

Compiled from Burbank Fire Department Records; ENSR, 1989, 1990a; Gregg and Associates, 1985a, 1985b; W. Robinson, personal communications.

The results of the 1984/1985 investigation indicated varying degrees of soil contamination associated with several of the tanks, sumps, and clarifiers on and adjacent to Parcel 1 at Plant B-6. Locations where reported total petroleum hydrocarbon (TPH) concentrations in soil exceeded 100 milligrams per kilogram (mg/kg) and/or where VOCs were detected above trace levels (0.1 to 0.5 $\mu\text{g}/\text{kg}$) included tanks B-6-F13, F14, F17, F18, F21, B-6-O, B-6-N, and clarifier B-6-Q. Based on the results of the 1984/1985 leak detection program, Gregg and Associates concluded that, of the tanks on or adjacent to Parcel 2, Tank B-6-F13 and clarifier B-6-Q were leaking and Tanks B-6-F14, B-6-F18, B-6-F21, B-6-N, and B-6-O were probably leaking. Low level soil contamination identified by Gregg and Associates at several of the facilities on or adjacent to Parcel 2 was mostly attributed to surface spills and overflows, rather than structural leaks. The methodology and soil analytical details for each investigated area are included in the site inspection sections of this report.

3.5.2.2 Underground Storage Tank Compliance Program

Lockheed initiated an underground storage tank compliance program in December 1988 to bring all of its tanks into compliance with Los Angeles County Department of Public Works (LACDPW) requirements. On January 1, 1990, the City of Burbank Fire Department took over responsibility for the compliance program from LACDPW. The compliance program is currently in progress. In general, the program involves: 1) tank integrity testing; 2) removal of tanks that are no longer needed by Lockheed; 3) drilling and sampling of soil borings at each tank site not sufficiently investigated by Gregg and Associates; and 4) site assessment and remediation of contaminated soils, if required.

The underground tank compliance work is being performed by ENSR Corporation. Of the 34 tanks, sumps and clarifiers located on or adjacent to Parcel 2 which were investigated during the 1984/1985 Leak Detection Program, 29 fuel and non-fuel tanks are included in the ENSR compliance program. Five of the Parcel 2 non-fuel facilities which were included in the 1984/1985 Leak Detection Program, B-6-C, B-6-E, B-6-F, B-6-J, and B-6-Q are exempt from the compliance program. Secondary spill containment tank B-6-C in Building 353 is exempt because it does not meet the definition of a tank due to its open top construction and it is only used as a secondary containment facility. Sump B-6-E, a wet wash reservoir inside Building 349 as designated by Gregg and Associates, was filled with sand and concrete in approximately 1985. ENSR reassigned the B-6-E designation to a 1,500-gallon steel underground emergency overflow holding tank located outside the south wall of Building 349. This tank is exempt because it is only used as a secondary containment facility. Clarifier B-6-F, outside the west wall of Building 353, is exempt because it is a pre-treatment facility which discharges to a municipal sewer system. Clarifier B-6-J is exempt because it was previously removed in 1983-84. Sump B-6-Q, located outside the south wall of Building 88, is exempt because it is used for flow through process in which storage is only temporary.

Twenty-six of the twenty-nine compliance program tanks located on or adjacent to Parcel 2 were removed or closed in place during 1989 and 1991, as shown in Table 3-3. The remaining three tanks, B-6-F5, B-6-F29, and B-6-F30 are still in service. Soil borings were drilled and sampled or tank excavation endpoint samples were obtained at each non-exempt tank location and at exempt facilities B-6-E (ENSR designation) and B-6-Q to assess potential soil contamination. The results of the tank compliance program are provided in the July 1989 "Leak Detection Investigation" and the August 1990 "Underground Storage Tank Closure Report, Plant B-6," prepared by ENSR Corporation (ENSR 1989, 1990a). An expanded leak detection investigation at Tank B-6-E is described in an April 1990 report (ENSR, 1990b). Methodology and soil analytical details for each tank are included in the site inspection sections of this report.

3.5.3 Other Investigations

Other environmental investigations conducted at the Plant B-6 site are discussed below and include:

- Transformer Survey - 1968, 1989;
- Soil Vapor Survey Investigation - 1988;
- LASC Potentially Responsible Party Investigation - 1988, 1989, 1990; and
- LASC Employee Interviews and Records Search - 1988.

3.5.3.1 Transformer Survey

In 1968, a survey of electrical substations located throughout the Lockheed Burbank facilities was conducted. The survey reported the location, type, voltage, and power rating (kVA) of each substation. Plant B-6 was reported to contain 7 oil-cooled or liquid-filled transformers and 45 non-liquid transformers at the time of this survey. One oil-cooled transformer was located at each of the following locations: Building 88; Building 304; and south of the former location of Building 331. The four liquid-filled transformers were located at Buildings 82A, 83 (2 transformers), and 88.

In 1989, LASC Facilities Engineering prepared a report regarding the removal and disposal of PCB-containing and PCB-contaminated transformers, capacitors, containers, and articles from the Lockheed Burbank facilities for the period from January 1, 1986 to September 18, 1989 (LASC, 1989). The report does not address the removal of 22 transformers that had PCB contamination levels below 50 parts per million (ppm) or any replacements of transformers which occurred prior to 1986.

Two transformers with PCB levels exceeding 500 ppm were removed from Buildings 82 and 309 in 1988. The transformer located at Building 309 contained three PCB contaminated oil switches, which were also removed. One transformer with PCB levels between 50 and 499 ppm was removed from the parking lot near Lockheed Gate 119, south of Building 332, in 1988. The cement substation slab at the Gate 119 parking lot, which reportedly showed signs of old PCB leaks, was removed and disposed along with the surrounding asphalt in 1989. Drums containing debris which may have included PCB-contaminated transformer parts and accessories, wiping and cleaning materials, and disposable safety clothing and gear were removed in 1989 from the Gate 119 and Building 82 substation areas (LASC, 1989).

3.5.3.2 Soil Vapor Survey Investigation

In 1988, a multi-phase soil vapor survey investigation was performed at and adjacent to the Lockheed Burbank facilities by URS Consultants. The objectives of the survey were to identify areas of potential soil contamination and assess the nature and extent of contamination. Most of the soil gas work performed at Plant B-6 was during the Phase 6 Investigation, where samples were collected and analyzed at 62 locations (URS, 1988d). Soil gas samples were analyzed for chlorinated solvents with a gas chromatography/electron capture detector (GC/ECD) and for total VOCs with a gas chromatography/flame ionization detector (GC/FID). Total hydrocarbons were reported based on GC/FID results.

The soil vapor survey showed the presence of elevated concentrations of PCE, TCA, and TCE at Plant B-6. Detectable concentrations of PCE in soil gas ranged from less than 1 to 350 $\mu\text{g}/\text{L}$; TCE concentrations ranged from less than 1 to 24 $\mu\text{g}/\text{L}$; and TCA concentrations ranged from less than 1 to 160 $\mu\text{g}/\text{L}$. Low concentrations of benzene (0.3 $\mu\text{g}/\text{L}$) and total hydrocarbons (0.5 $\mu\text{g}/\text{L}$) were detected in soil gas east of Building 310 (location MO2). Four areas of potential soil contamination were identified by URS based on the soil gas results: 1) the area between Kenwood Street and Parking Lot 8 (TCA); 2) the area south of Building 352 (PCE, TCA); 3) the area north and west of Buildings 309 and 310 (TCE); and 4) the area southeast of Building 371 (PCE, TCE, TCA). An additional area of elevated PCE concentrations in soil gas (44 $\mu\text{g}/\text{L}$ at point M33), which could reflect a contaminant source area, occurs at the westernmost portion of Plant B-6, south of Building 357.

In October 1988, a Phase 7 report summarizing the Phase 1 through 6 soil gas survey results was prepared for LASC by Lockheed Engineering and Sciences Company, Inc. and URS (URS and LESC, 1988). This summary report concludes that elevated PCE concentrations in soil gas at Building 371 (10 to 350 $\mu\text{g}/\text{L}$) suggest either the possible presence of soil contamination at the eastern end of the building or minor surface spills in the area. Elevated PCE in soil gas at the south end of Parking Lot 8

(53 µg/L) is judged to reflect either soil contamination at some distance away from the sampling point or past surface spills. The elevated concentration of PCE in soil gas at the western plant boundary (44 µg/L) is judged to reflect either remote soil contamination, possibly to the west on Burbank-Glendale-Pasadena Airport property, or surface spills.

The report recommends that additional evaluation of the Building 371 area be conducted to determine if a source of soil contamination exists in this area. Additionally, the report recommends that the potential for a PCE/TCE contaminant source area at Pacific Airmotive Corporation, located west of the southwest corner of Parking Lot 8, be further evaluated. No further work has been done in these areas.

3.5.3.3 Potentially Responsible Party Investigation

In 1988, LESC conducted a potentially responsible party (PRP) investigation to develop a list of companies whose activities could have contributed to groundwater contamination in the eastern San Fernando Valley (LESC, 1988b). The investigation consisted of identifying companies that use or handle TCE, TCA, PCE, or other chlorinated organic compounds and also are currently or were previously operating in the areas upgradient from contaminated wells and from LASC facilities. Information on chemical usage was obtained from the RWQCB and other regulatory agencies. Site walks and aerial photograph interpretation was also used to evaluate PRP's.

Results of the PRP investigation identified a total of 38 "primary" PRPs. "Primary" was defined as a known spill site or a highly suspected PRP, based on location with respect to contaminated LASC groundwater monitoring wells, chemical usage, spill potential, inclusion on PRP lists developed by the U.S. Environmental Protection Agency (EPA) or RWQCB, condition noted during site walk, and/or nature of violation history.

In January 1989, the LESC primary PRP list was modified by adding six companies and recommending the removal of three, resulting in a total of 41 primary PRPs (LESC, 1989a). This modification resulted from additional RWQCB site inspections and additional agency file review.

In July 1989, LESC further modified the primary PRP list in response to additional agency information and arrived at a total of 46 PRPs (LESC, 1989b). Table 3-4 lists each primary PRP identified. Figure 3-9 presents the primary PRP locations in relation to the Plant B-6 site.

Beginning in 1989, URS Consultants compiled several summaries of information available in RWQCB files regarding groundwater and soil contamination at properties located in the Burbank area (URS, 1989; URS, 1990b; URS, 1990c). The

NOTE: FIGURE AFTER LESG 1989b
"POTENTIALLY RESPONSIBLE PARTY
INVESTIGATION STATUS REPORT."

URS summary report, dated December 1990, compiled information from RWQCB files on 44 companies. As indicated in this summary report, as of November 20, 1990, EPA had identified 23 of the 44 companies as PRPs for the groundwater contamination at the North Hollywood-Burbank National Priority List site in the eastern San Fernando Valley. With the exception of one company, the EPA identified PRPs listed in the URS report are included in the list of PRPs identified by LESC (Table 3-4). As indicated by URS, the EPA may add or remove companies from their PRP list as additional information becomes available.

An erratum to the December 1990, URS summary report indicated that subsurface contamination has been verified at 38 of the 44 properties and the remaining six companies have yet to complete subsurface investigations (URS, 1991). Investigative efforts at five of the 44 properties have progressed to construction of groundwater monitor wells, with all five sites showing detectable levels of groundwater contamination.

3.5.3.4 LASC Employee Interviews and Records Search

In 1988, LASC conducted employee interviews and an in-house record search to obtain information regarding chemical use and spill histories at the LASC-Burbank facilities (including Plant B-6) and to identify potential contaminant source areas (LESC, 1988c). A total of 59 employees, many of whom had worked for Lockheed for periods of 10 to 35 years, were interviewed. Of the 59 interviewed employees, 23 had information on chemical leaks or spills, 28 had information on chemical usage, and 8 had no knowledge of chemical leaks, spills, or usage at the Burbank facilities (LESC, 1988c). Plants A-1 and B-1 were identified by interviewed employees as having areas where spills and leaks occurred.

One employee identified an aircraft fuel spill area in the Parcel 1 portion of Plant B-6, north of Building 351 and west of Building 82. Aircraft fuel was reportedly dumped in this area and hosed down with water by the Lockheed Fire Department. Runoff was directed to storm drains which discharge east, toward Hollywood Way.

Many of the interviewed employees identified chemical use areas at Plant B-6. The identified Parcel 2 chemical use areas included Building 304, areas south of Building 304, and areas north of Buildings 309/310. Solvents were identified as having been used in Building 304 (MEK). Interviewed employees reported that south of Building 304, aircraft were filled with fuel for engine testing. One employee indicated that solvents may have been used in 1955 in the area north of Building 309/310, where small aircraft were parked.

The LASC search for historic Lockheed documents and files relating to chemical and solvent usage, spills, and leaks proved to be difficult due to short retention times for these records.

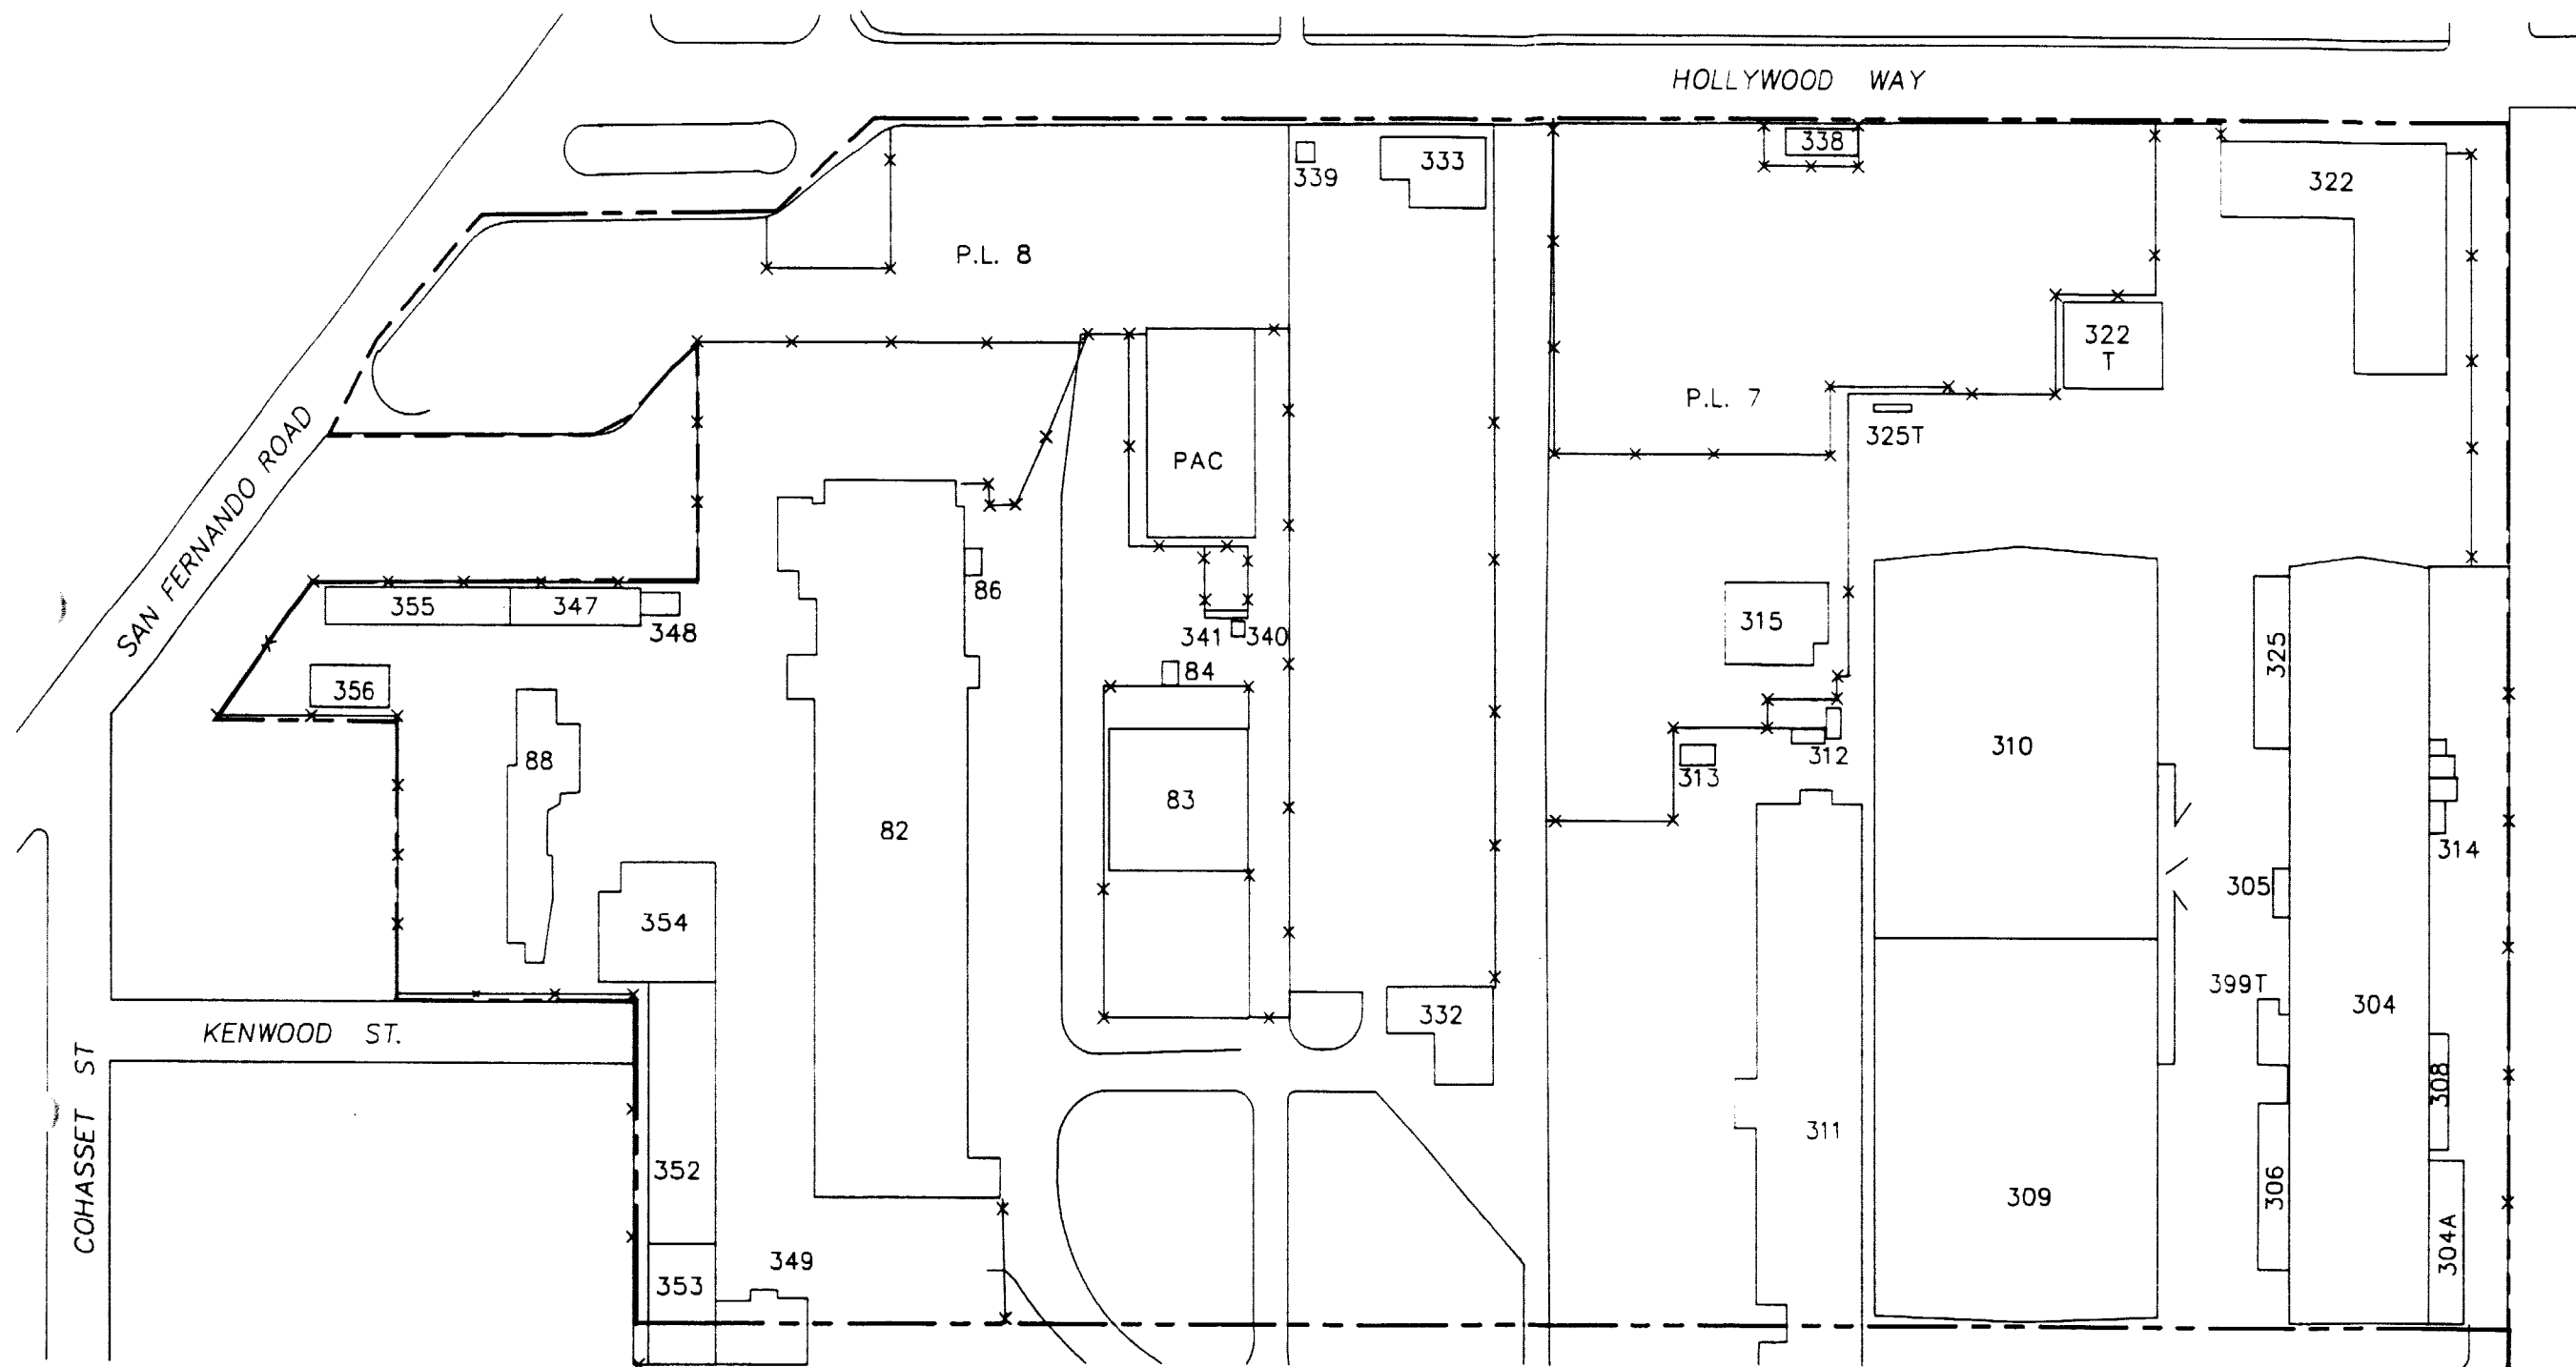

SECTION 4

SITE INSPECTIONS

As noted in the Introduction, Parcel 2 comprises 65.2 acres immediately east of Parcel 1. Parcel 1 facilities were evaluated in the October 1991 Parcel 1 environmental assessment report (McLaren/Hart, 1991). This section discusses past and present operations associated with the buildings and surrounding areas in Parcel 2 and presents the results of site inspections. The buildings and surrounding areas that are encompassed by Parcel 2 are shown on Figure 4-1. Plant B-6 facilities that lie on the Parcel 2 boundary line are also evaluated in detail in this report. Former Lockheed facilities that are adjacent to Parcel 2 are briefly discussed below, because chemical use practices at these facilities could potentially impact soil in Parcel 2. The building and area inspection discussions included in this section are as follows:

- Building 82;
- Buildings 83 and 84;
- Building 88;
- Building 304 and adjacent facilities;
- Buildings 309 and 310;
- Building 311;
- Buildings 312, 313, and 315;
- Building 322;
- Building 322T;
- Building 325T;
- Building 326;
- Buildings 332, 333, and 339;
- Building 338;
- Buildings 340 and 341;

4.1 BUILDING 82

Building 82, its annexes (Buildings 82A through 82E), and an adjacent associated building (86) are located in the northern portion of Parcel 2, Plant B-6, as shown on Figure 4-1. Floor plans for the ground floor of Building 82 and the three floors of Building 82C are shown on Figure 4-2. Floor plans for Buildings 82A, B, D and E and Building 86 are shown on Figure 4-3.

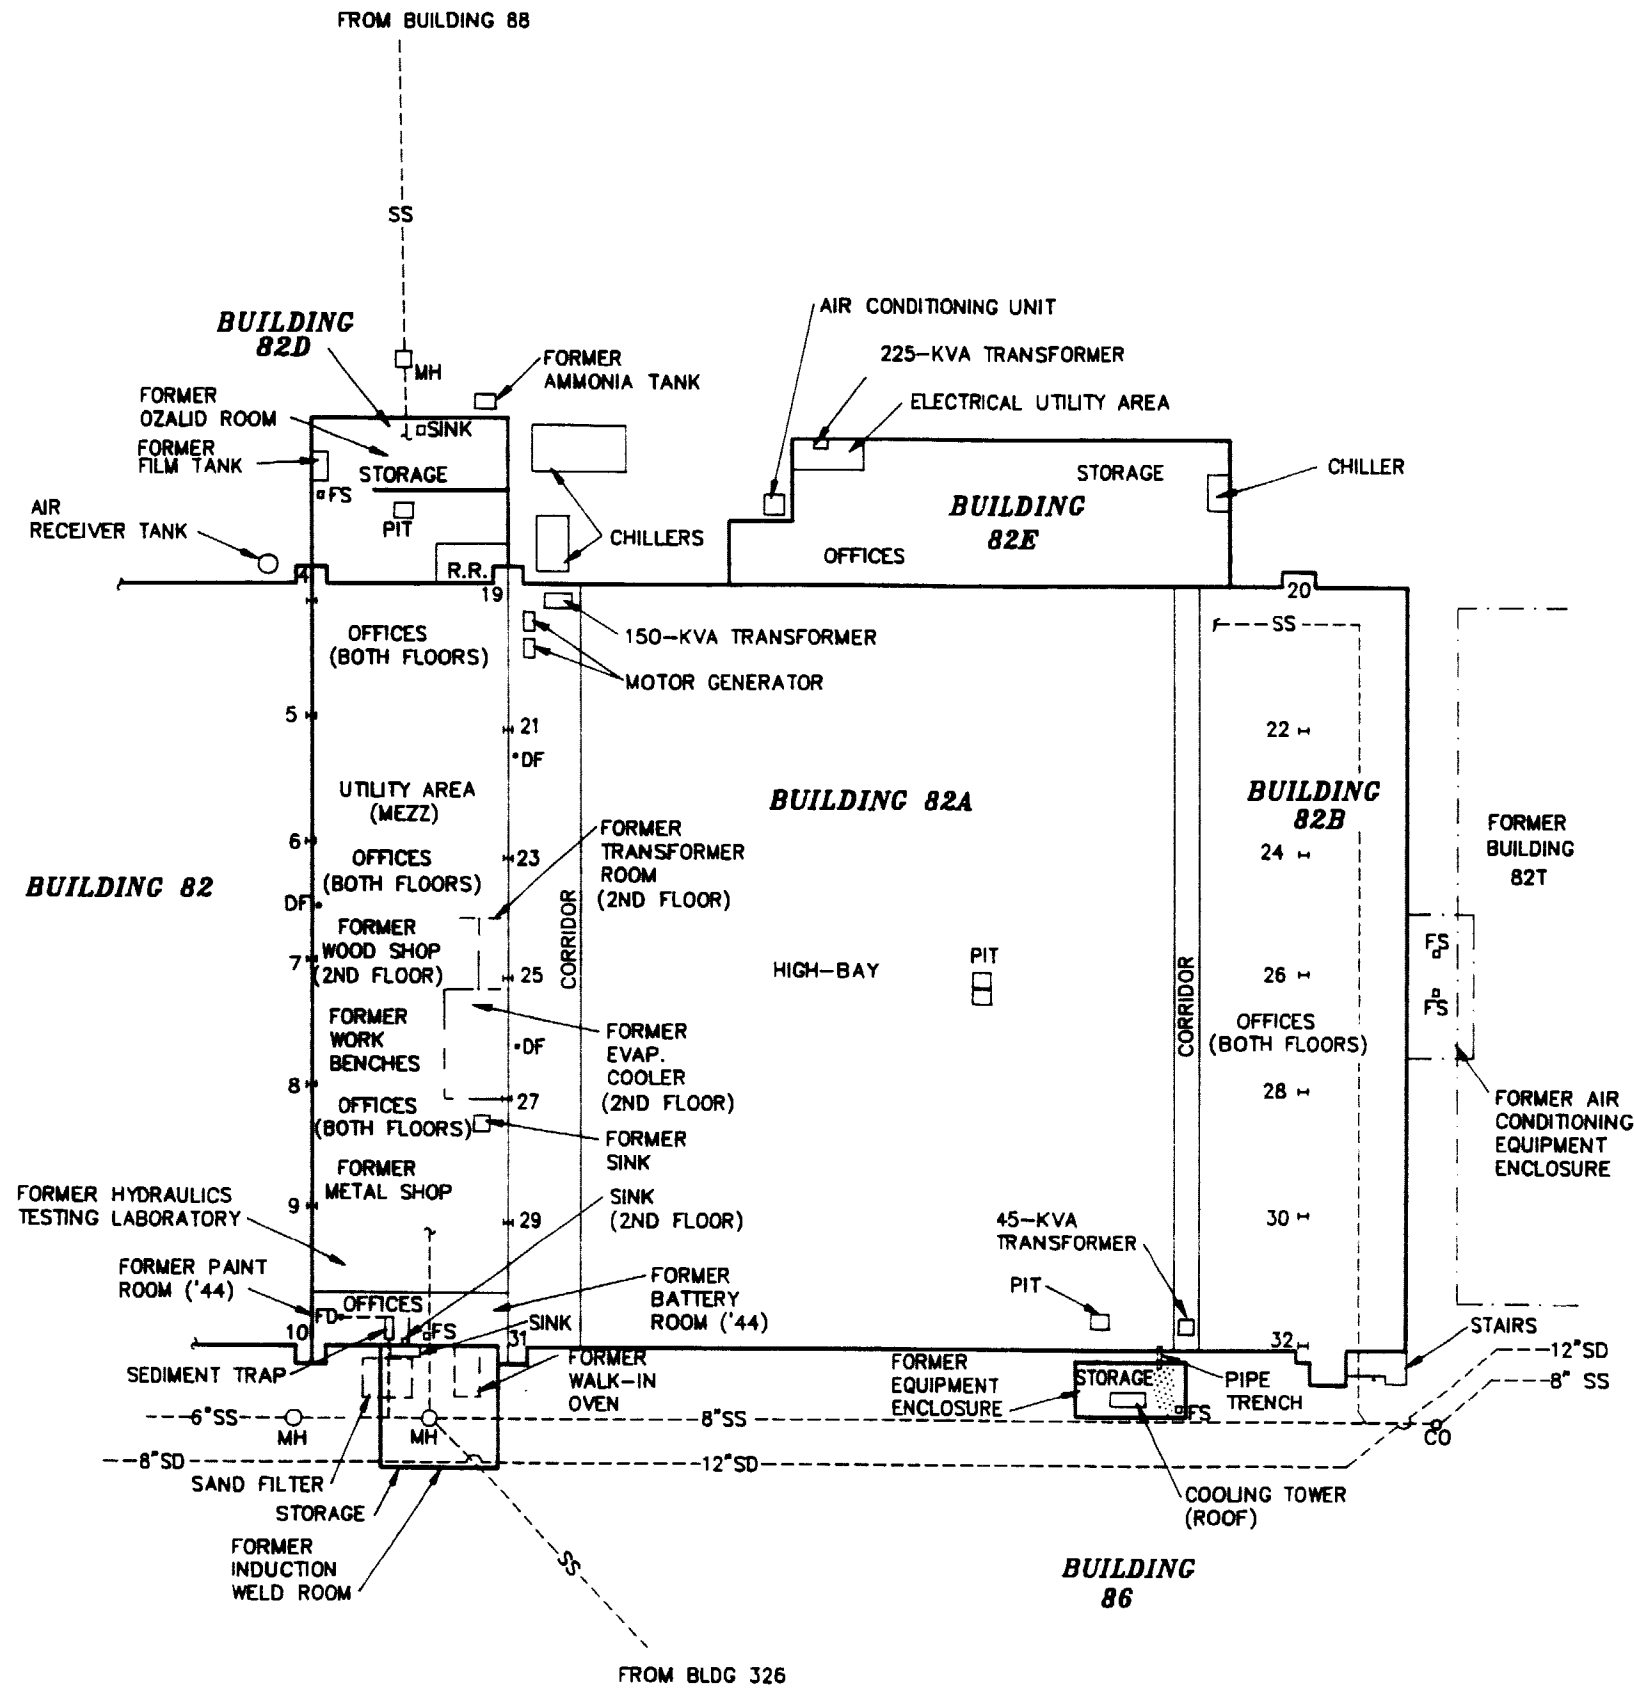

Information on the present and historical use of Building 82 was compiled with the help of the following Lockheed personnel: Mr. Mel Cope, Mr. Chuck Deyoe, Mr. Bob Diltz, Mr. Michael Donathan, Mr. Hunter Echols, Mr. Leroy Flynn, Mr. Les Freer, Mr. D.G. Gray, Ms. Judy Hartman, Mr. Hans Kluewer, Mr. Don Kreutzfeldt, Mr. Spencer Norman, Mr. Walt Macaritto, Mr. Lawrence Reitz, Mr. Bill Robinson, Mr. Ralph Rodriguez, Mr. A. F. Rudroff, Mr. M. Y. Sharifi, Mr. Harley Waggoner, and Mr. Arthur Ziebell, Jr. Discussions of the building construction details, previous operations and present use, previous investigations, and site inspection are presented below.

4.1.1 Construction Details

Design of Building 82 began in 1941 and construction was completed in 1942 or 1943. The construction of the eastern portion of the building, known as Building 82A, was completed in 1944. The annexes at the east and west ends of the building, known as 82B and 82C, were completed in 1951 and 1952, respectively. The 40-foot by 36-foot annex north of the northwest corner of Building 82A, known as 82D, was built in 1955. An annex at the southwest corner of Building 82A was built as an induction weld room in approximately 1961. Annexes on the north and south sides of 82A, designated 82E and Building 86, respectively, were constructed in the early 1980s. An office trailer complex designated as Building 82T was installed east of Building 82 in 1982 and removed in 1991. The construction details and other significant features of each building are discussed below.

The large, high-bay areas of the building, known as 82 and 82A, contain manufacturing, assembly and office areas. Six large doors between each set of columns on the north and south sides of Buildings 82 and 82A provide access to the high-bay areas. The western and eastern sections of the building, designated 82C and 82B, respectively, consist mainly of offices. The 40-foot wide section of the building located between Buildings 82 and 82A (between columns 4 and 19 on the north and columns 10 and 31 on the south) consists primarily of offices. Additional offices were built at the east end of the Building 82 high-bay abutting the 40-foot wide office area. The second floor of this two-story office area in Building 82 is commonly referred to as the mezzanine offices.

The high-bay portion of Building 82 is constructed of steel trusses and girders, wood purlins and wood sheathing. The building has a wooden roof with a sawtooth design. The exterior walls are corrugated iron on steel girts. The Building 82 high-bay has a concrete slab floor with approximately 27 utility pits placed at regular intervals throughout the area. The utility pits typically contain compressed air, water, and electrical outlets. They have four-inch thick reinforced concrete sides and crushed rock bottoms. There is a small utility trench in the southwestern corner of the Building 82 high-bay that leads from two fan compressors to a freezer. A large Verson press in the southwestern portion of the Building 82 high-bay has a machine pit set 19 inches into the machine's five-foot thick reinforced concrete isolation pad. All other machinery in Building 82 is set on isolation pads or directly on the concrete floor without underlying sumps or pits. The offices in the east end of Building 82 have asphalt tile floors over the concrete slab, wood and plaster walls, and acoustic tile ceilings. Some offices are carpeted. The offices on the second story have wood floors.

Due to the nature of the current activities in the Building 82A high-bay area, complete access was not permitted for purposes of this assessment. Building 82A is constructed similarly to Building 82, with steel and wood framing, wood sheathing, and a concrete slab floor. Most of the Building 82A high-bay has been modified to form an enclosed work area within the high-bay. The enclosed area has gypsum board covered walls that extend approximately 15 feet off of the floor and a ceiling that is suspended from the high-bay roof trusses. The top of the ceiling of the enclosed area is covered with fiberglass insulation. Two corridors are present east and west of the walls of the enclosed area. Air conditioning ducts, chilled water lines, and air conditioning condensate drain lines extend across the building above the eastern corridor. The wooden roof of Building 82A is flat, however. A small exposed concrete-lined utility trench containing air lines and hydraulic lines runs under the wall between the 82A high-bay and Building 86.

The 40-foot wide area between Buildings 82 and 82A originally had ground level offices and shops with a mezzanine level on top. This second level was closed in at some time, and a new mezzanine was created on top of the second story. On the north end of this mezzanine is a utility area with a steel plate floor that contains air conditioning and air handling equipment for Building 82A. The offices in this 40-foot wide structure have carpeted floors, acoustic tile ceilings, and gypsum board-covered walls.

Buildings 82B and 82C have wood frame walls and roofs, stucco exterior walls, gypsum board interior walls, concrete slab floors on the ground level, and carpeted wood floors on the second floor of Building 82B and the second and third floors of Building 82C. The roofs of these two buildings are covered with built-up asphaltic roofing materials. Building 82D and the induction weld room at the southwest corner of Building 82A are single-story wood-frame structures with concrete slab floors. The floor in Building 82D is covered with 12-inch square floor tiles.

Buildings 82E and 86 have concrete block exterior walls, concrete slab floors, and galvanized steel roofs. The offices in Building 82E have carpeted floors, acoustic tile ceilings, and gypsum board walls.

Overhead monorails supporting electric cranes are located over the north and south halves of the Building 82 high-bay. Ducts for ventilation, heating, and cooling of Building 82 are located on the ceilings of the various sections of the building. Heat is provided by the boilers in Building 84, and warm air is directed toward the high-bay floor area by fans and cloth ducts. Air handlers for the west end of the building are located in an equipment room in Building 82C. Air handlers for Building 82A are located on the mezzanine at the north end of the 40-foot wide office bay. Additional air conditioning units are located inside and outside Building 82E and on the roofs of Buildings 82B and 82C.

There are five large transformers serving the building. The transformer room on the ground floor of 82C has dry-type 500-kVA and 1,000-kVA transformers. Substation 82, outside the building southwest of column 11, has a 500-kVA, oil-cooled transformer. Building 82A has a dry-type 150-kVA transformer at the north end of the corridor near column 19. Building 82E has a dry-type 225-kVA transformer in the electrical utility area at the north end of the building. A 45-kVA transformer is located at the southeast corner of Building 82A.

The Building 82T trailers were constructed of sheet metal siding over plywood exterior walls. The trailers had linoleum tile floors, carpeted hallways, an acoustic tile ceiling, and fluorescent lights. The trailers were cooled with wall-mounted air conditioning units, and they were served by dry-type electrical transformers near the southeast corner of the building. Building 82T was removed in 1991.

The yard around Building 82 is paved with asphalt. There is a large concrete pad north of Building 82 and a smaller set of pads northwest of the western end of Building 82. A concrete pad for a former paint booth is located at the northwest corner of Building 82, and a covered employee break area is located just north of Building 82C. Except for small concrete pads for equipment described below, the remainder of the yard is paved with asphalt.

4.1.2 Previous Operations and Present Use

4.1.2.1 Interior Areas

Building 82 has been used since its construction as a machine shop, fabrication area, and final assembly area. A 1942 plot plan referred to the building as "Vega Flight Control Hangar No. 82," and part of the building was used as an engineering flight test facility until the late 1950s. A 1946 aerial photograph and plot plans dated 1948

and 1965 indicate that the building was used for servicing aircraft. From the 1940s to the present, the building has been used for experimental work, especially in the eastern portion designated 82A.

During the 1950s, the north and south halves of the Building 82 high-bay were divided by stanchions into assembly line and manufacturing areas, respectively. Specific locations of equipment have changed many times within the building; however, manufacturing activities have generally been concentrated in the southern portion of the building. The various office wings of the building have also been reconfigured many times. The configuration of the building shown on Figures 4-2 and 4-3 represents current conditions, supplemented by notes on the most environmentally significant features from the past.

The 21,000-ton Verson hydraulic press was installed in the southwestern portion of the Building 82 high-bay on a machine pit/isolation pad in approximately 1962. This press uses a balloon bladder which is pumped full of hydraulic oil to form aluminum, stainless steel, and other metal parts over dies. The hydraulic oil is stored in a vertical oil accumulator tank located adjacent to the press. Hydraulic oil that leaks to the machine pit beneath the press is removed by the Maintenance Department and transported off-site as hazardous waste. The machine pit is cut directly into the monolithic concrete isolation pad. Fresh hydraulic oil is supplied by the Maintenance Department in 55-gallon drums. A smaller hydraulic press located north of the large Verson press was reportedly removed in approximately 1986. A 5,000-pound Verson hydraulic press is located along the south wall of the high bay. Four current or former freezers have been associated with the three hydraulic presses. The area just east of the large Verson press contains hand presses, shrinkers, stretch presses, rollers, and inspection tables. A contour former and two draw formers are mounted on concrete pads east of this small equipment. The two draw formers have hydraulic pumps.

A roller and several spin lathes were moved to the area north of column 12 from Building 114 on Plant B-1 in early 1991. This area also contains a Do-all saw, several drill presses and routers, including a duplicator router. The drill presses, lathes, and routers have self-contained cutting fluid reservoirs. Spent fluid is collected in drums by facility maintenance personnel and transported off-site for recycling or disposal. Cutting fluids (coolants) are stored in the hazardous materials storage area south of Building 88. A Cerrobend heating pot and water cooling bath is located along the south wall east of Column 12. Cerrobend, a lead-containing alloy that melts at 160 degrees Fahrenheit, is used to make hammers and blocks. The cooling water for the Cerrobend system, which was shut down in June 1989, discharged to a two-stage sand trap located to the east and then to the storm drain south of the building. The sand trap also receives discharge from a roof drain and a drinking fountain. Equipment in the area east of the Cerrobend system includes a roller, a rivet squeezer, a hole punch, hand brakes, a drill press, a hand shear, and grinders. A carpentry shop was formerly located east of this equipment area. The

former carpentry shop area is now used as a break area. A weld shop located east of the break area contains a roll welder, a spot welder, a seam welder, arc welders, and a brazier. The brazier ages metal parts at temperatures up to 2,000 degrees Fahrenheit. A former furnace located near the brazier was moved to Building 371 in approximately 1982. An isolation pad west of the weld shop formerly held a cold box. Compressed gases used in the welding area include argon, helium, acetylene, and oxygen. The argon tank is located outside Building 82, south of the weld shop, as shown on Figure 4-2.

A metal process line was formerly located north of column 11 in the southern part of Building 82. The process line was reportedly used to prepare small aluminum and titanium parts for spot welding and painting. It is not known when the process line was installed. A facilities drawing dated 1954 indicated that the process line tank arrangement at that time consisted of a hot rinse tank, an alkaline cleaner tank, an acid etch tank, and a cold water rinse tank placed within a spill containment pit approximately one-foot deep. The lined stainless steel tanks were approximately 6-feet long, 2-feet wide and 3.5-feet deep. Drains from the two rinse tanks and the alkaline cleaner tank, and overflow from all tanks except the cold water rinse tank, discharged to a sump located southeast of the process line and then to the storm drain line south of the building. The cold water rinse tank was not equipped with overflow piping. Heat for the tanks was provided by steam lines from boilers in Building 83. The tank arrangement was modified in 1954 by removing the hot rinse tank and adding a spray rinse tank and a chromodize tank. The two rinse tanks and the alkaline cleaner tank still drained to the sump. Overflow from all tanks except the cold water rinse tank, which did not have overflow piping, drained to the sump. This sump is designated tank B-6-J in the LASC Underground Storage Tank Leak Detection Program and is discussed below. Another pit is shown between the containment pit and the sump on the 1954 drawing; however, the use of this pit and its depth are not known. An iridite tank and a hot water tank are shown immediately west of the original process line tanks within the one-foot deep containment pit in a 1965 drawing. These new tanks were reportedly separated from the original tanks by a 1-foot high berm in the containment pit. A facilities drawing dated 1977 shows that the process tank heating source was changed from the existing steam lines to electric tank heaters. The 1977 drawing shows six tanks in the process line, but only designates three of them according to their contents. An alkaline cleaner tank and a deoxidizer tank are identified in the eastern set of four tanks and a water tank is designated in the western pair of tanks. The containment pit also reportedly contained a portable phosphate degreaser of approximately 55-gallon capacity. The metal process tanks were reportedly moved to Building 371 in approximately 1983. The containment pit, sump, and nearby pit were filled at that time. The former sump location was inspected in 1984 by Gregg and Associates, but the sump had been filled with concrete by that time. No cracks were noted in the surface of the concrete cap. No other investigations were conducted at tank B-6-J.

A Murdoch "hot joggle" press was installed in the location of the former process line in 1983. The hot joggle press is electrically heated from a portable power cart and has a self-contained hydraulic pump and reservoir. The remainder of the southern portion of the Building 82 high-bay is occupied by a machine shop. Equipment in this area includes hydrotels, power brakes, shears, mills, lathes, a jig borer, a horizontal boring mill, grinders, a band saw, a hone, and drill presses. The largest hydrotel in this area, located approximately halfway between columns 10 and 11, is used to profile parts. This hydraulically operated machine formerly used approximately 55 gallons of hydraulic oil per month, in addition to lubricating oil and a soluble oil coolant. Any leakage of hydraulic oil drained to the coolant recovery system at the bottom of the machine. When the coolant recovery system began to overflow to the shop floor, the maintenance department was called to vacuum the oil and place it in a waste oil drum for disposal as hazardous waste by a licensed contractor. The hydrotel has been repaired, and no longer leaks hydraulic oil to the coolant reservoir. Currently, the machine is oiled and the coolant recovery system is cleaned out every two months as a part of routine maintenance. Stock metal is stored on racks north of the hydrotel, and scrap metal is also stored in this area. Metal chips from the machining operations are temporarily stored in chip bins that are located at the north end of the machine shop, near an area of smaller equipment. A new oven for aging metal after it has been formed and several empty isolation pads for former shears are located in the northwest portion of the machine shop area. A rotoclone near the center of the area removes particulates from two grinders.

The northwestern portion of the Building 82 high-bay is used as an inspection area. Part of the area is occupied by a material review booth containing desks and storage areas, where parts are evaluated before shipment. A shipping and receiving area is located adjacent to the material review booth. A fenced area to the east is used for blueprint control. A work bench area located near column 2 contains sanders, grinders, band saws and a drill press. Deburring machines and tumble burrers located along the north wall of the high-bay near column 2 discharge water to the sewer through either an aboveground clarifier or a chip trap located next to the equipment.

The area approximately halfway between columns 2 and 3 is used for storage. Scrap metal bins for aluminum, steel, and titanium are located along the wall, and the area to the south and east has been used for storage of extruded metal pieces and bar stock since 1983.

A chemical control crib for the Building 82 complex was installed near column 3 in early 1991. The fenced area contains a desk and files, a refrigerator for temperature sensitive materials, open metal shelves, three flammable materials storage cabinets and one acid storage cabinet. Small volumes of chemicals are stored in this crib and are dispensed for use throughout Building 82 and adjacent buildings. Bulk chemicals are stored at the hazardous materials storage areas at Buildings 349 and 88.

The area south of the chemical control crib is used for final assembly of aircraft tail pipe sections. Small amounts of IPA are used in this area to wipe down the parts with rags; the used rags are put into flammable storage buckets and disposed as hazardous waste. A pneumatic hammer for forming sheet metal was housed in an area south of column 3 until approximately 1981, when it was reportedly moved to Building 114 at Plant B-1. Six hydraulic punch presses, including one large, computer-controlled unit, are located east of the hammer room. These presses have self-contained hydraulic oil pumps and reservoirs.

Remnant stock and templates are stored in a fenced area east of the punch presses. The northeast corner of the Building 82 high-bay is used for sheet metal stock storage. A battery charger for an electrically-powered Raymond side loader that is used at the stock area is located west of the storage racks. Power shears for cutting stock are located south of the remnant stock area. The shears use no cutting fluids, but they have small (5- to 10-gallon) self-contained hydraulic reservoirs.

According to a 1944 drawing, the 40-foot wide office bay between Buildings 82 and 82A originally had a paint room, battery room, metal shops, and laboratories located in the area south of columns 8 and 27. Another 1944 drawing shows a floor drain in the paint room discharging through a sediment trap and a sand filter to the sanitary sewer line south of the building. The drawing shows the sediment trap as 1.5-feet wide, 5-feet long, and 2-feet deep, with metal baffles, and the sand filter as 5-feet square and approximately 6-feet deep, with 2-feet of sand in the bottom, through which the fluid drained. Both structures were constructed of 6-inch thick reinforced concrete. Interviewed facility personnel had no information on the former paint room and associated operations; facility drawings indicate the paint room was present as late as 1958. A floor drain beneath a hose bibb in the battery room also discharged to the sanitary sewer. A 1958 facilities drawing shows the former battery room designated as "Lab No. 2." The function of this lab is not known. Another drawing shows the installation of an electrically-heated walk-in oven immediately south of the lab area. The function of the oven is not known, and its existence could not be confirmed by Lockheed personnel. The second level of the office bay had a wood shop, a transformer room, a rest room, and offices. In 1952, an instrument lab from the ground floor of the office bay and a strain gauge lab from the east end of the Building 82 high bay were relocated to the second floor of the office bay, and the metal shop on the ground floor was expanded, according to facilities drawings. Equipment in the metal shop included shears, a roll, a brake, a power hack saw, hand-operated presses, drill presses, punch presses, lathes, mills, grinders, a small electric welder, and a disc sander. It is likely that cutting oils and hand-applied cleaning solvents were used in this area at that time. Reportedly, by the 1970s, the

only power tools used in the metal shop were saws. During the 1970s, the southwest corner of the bay, between columns 9 and 10, was occupied by a Hydraulics Testing Laboratory. Reportedly, bench-scale pressure testing of actuators, cylinders, and landing gear was conducted on approximately six work benches. The source of hydraulic power for these tests is unknown. Lockheed employees could recall no spills of hydraulic oil in this area.

An induction weld room was annexed to the south side of the 40-foot wide office bay in approximately 1961, at the reported location of the former walk-in oven. A stainless steel sink was installed against the north wall of the weld room. The floor drain in the former battery room to the north was replaced with a 12-inch square floor sink, which received discharge from the stainless steel sink and from a 1-inch drain line from the welder. The floor sink drains to the sanitary sewer south of the building.

Few facility drawings of the original construction and subsequent modification of the Building 82A high bay were available for review. A 1961 drawing shows electrical utility pits, with bottoms consisting of crushed rock, adjacent to electrical generators. The drawing does not indicate where in Building 82A the pits were located. A motor generator is located near the 150-kVA transformer at column 19, but it is reportedly not used. A series of 1983 drawings show the construction of a shielded enclosure within Building 82A, but Lockheed personnel stated that the enclosure was not built. An existing pit is shown on the drawings near the center of the high bay, but the nature and construction of the pit is not shown. An existing service corridor, described above under Construction Details, is shown running across the high bay near the east end of the building. Building 82A reportedly contains no machine pits. While features noted on aerial photographs indicate that some aircraft servicing occurred in the high bay in the 1940s, the building has reportedly been used primarily for final assembly since at least 1969. As discussed below under Building 86, hydraulic pressure lines entered Building 82A at the southeast corner. Specific details on the use of hydraulics in the building are not known; however, it is likely that hydraulic pressure was used in final assembly testing performed in the building. Final assembly operations involved application of small quantities of wipe solvents to parts using rags. The dirty rags were placed in metal cans, and the rags were disposed as hazardous waste. Some composite sanding and tank sealing using proprietary materials were done in the building in the mid-1980s. No manufacturing of any kind has occurred in the high-bay since at least 1988. Building 82A currently has an enclosed display area with restricted access that occupies much of the high-bay.

A 1951 facilities drawing for Building 82B indicates that the offices on the first floor were occupied by a "Connie" (Constellation cargo/personnel transport aircraft) group, an instrumentation group, pilots, and undesignated offices. Mezzanine offices are first shown on a 1960 drawing that also shows the addition of rest rooms to the building. A design drawing dated 1980 and marked "as-built" in 1982 shows the

modification to the current configuration of offices, rest rooms, and drafting areas. An equipment enclosure east of Building 82B that contained air conditioning equipment and two floor sinks, presumably for condensate, was demolished at the time of the office modification. New air conditioning equipment was installed on the roof of 82B.

A 1951 drawing shows the northwest corner of Building 82C as a battery charger room and the northeast corner as a generator room for the battery charger. A floor sink that drains to the sanitary sewer is shown in the southern portion of the battery charger room. The original use of the floor sink is not known. The battery charger room is currently used as an office. A fan room, electrical vault, and transformer room shown on the 1951 drawing near the center of Building 82C house similar equipment today. The transformer area was located in a lean-to at the west end of Building 82 prior to the construction of Building 82C. The original transformers had capacities of 100-kVA for power and 200-kVA for light, and they were cooled with pyranol, according to a 1942 drawing. Information on whether pyranol contains PCBs was not available. Lockheed records show that three 200-kVA pyranol-cooled transformers were installed in that location in 1962. A 1968 internal survey showed that Building 82C had a 1,000-kVA dry-type transformer for power and a 500-kVA dry-type transformer for light. These two transformers, installed in 1964, are still in use. It is not known whether the pyranol-cooled transformers were disposed of at that time and whether any spills of the pyranol occurred. The other rooms in Building 82C, including a former tool room, blueprint room, radio room, and radio and radar shop, are used as offices or storage. The second and third stories of Building 82C contain offices, rest rooms, and a former dark room. The portion of Building 82C that extends south of the main building contains offices. No chemicals are currently used in these rooms; no chemical usage associated with former operations in these rooms has been identified.

A 1954 facilities drawing shows the installation of a cooling tower at the north end of Building 82C. The drawing indicates that the cooling tower provided condensing water to unit conditioners inside the building and condensate from the tower discharged to a floor drain inside the battery charger room. The drawing also shows an ambulance garage, designated P357, at the north end of Building 82C, west of the cooling tower. A 1955 drawing depicting the installation of a paint spray booth at the northwest corner of Building 82 gave no indication of the cooling tower or the ambulance garage, and it is not known whether the cooling tower and garage were ever constructed. The paint booth was installed, as confirmed by Lockheed personnel and field observations, and was used for painting small parts from the machine shop in Building 82. This paint booth was reportedly abandoned in 1976 and replaced by a paint spray booth directly north of Building 82C. The second paint spray booth was not used after the construction of the painting facility at Building 349 in 1981, and the area has been converted to an employee break area.

Building 82D was annexed to the north end of the 40-foot wide office bay in 1955. The building was used as an ozalid (blueprint) room. The ozalid machines in the northern part of the building were served by an ammonia tank located outside the northeast corner of Building 82D. A floor sink was installed along the west wall of Building 82D to receive discharge from a film tank in Building 82D and reportedly from a dark room inside Building 82. The location of this dark room could not be confirmed, but may have been in the second floor mezzanine in the eastern portion of Building 82. An aboveground sink at the north wall of the building discharges to the sanitary sewer. An electrical utility pit is located in the floor in the center of Building 82D. The ozalid room was modified slightly in 1966, and it was closed down in approximately 1981. Building 82D was reportedly vacant from approximately 1983 to 1986, and it has been used since 1986 for storage.

No facilities drawings were found for Building 82E, an annex north of Building 82A that was reportedly built in the early 1980s. The building consists of offices, a conference room, an electrical utility area, and dry storage areas. No internal Lockheed records were found regarding the 225-kVA transformer that was observed in the utility area.

Building 86 was constructed in 1983 and contained a hydraulic unit that supplied hydraulic pressure to Building 82A through a pipe trench connecting the two buildings. A cooling tower on the roof of Building 86 cooled the hydraulic unit and discharged condensate to a floor sink in the southeast corner of Building 86. Building 86 is currently used for storage.

Building 82T consisted of thirteen adjacent trailers that were installed in 1982 and were used for offices and conference rooms. A coffee room and rest rooms were located at the south end of the building. Building 82T was removed in 1991.

4.1.2.2 Exterior Area

The area exterior of Building 82 was used in the past in support of flight-line activities and for aircraft staging operations. Blast fence sections were located north, east, and south of Building 82A from 1945 through approximately 1970. These blast fences were used for aircraft staging operations which included engine start-ups and routine system checks. Reportedly, no significant maintenance activities were performed at these blast fence areas. Aerial photographs dated 1945 show Hudsons, Constellations, P-2Vs, and occasionally smaller twin-engine aircraft parked on concrete pads near the northeast, southeast, and southern portions of the blast fence. Minor staining is visible along the western border of the blast fence; however, staining is most visible at the southeastern pad in aerial photographs taken in 1945 through 1957. The area to the south and east of Building 82 and 82A has been used in recent years for employee automobile parking.

Two large concrete pads located north of Building 82 were used for aircraft staging. A wooden shed that appears to be used as shelter for aircraft is visible covering a majority of the larger of the two pads in 1945 aerial photographs. Minor stains are visible in the vicinity of the shed on aerial photographs. The shed is not visible in 1948 aerial photographs. No structures are visible over the smaller pad, located approximately 200 feet east of the larger pad, and no staining is visible in the aerial photographs.

Reportedly, the paint booth located near the northwest corner of Building 82 was used for only a limited time between 1952 and approximately 1978 for small parts painting. The replacement paint booth, which was located just west of the old paint booth, was used from 1976 to 1980. The construction of the Building 349 painting facility eliminated the need for this paint booth, and it was converted to an employee break area.

Former blast fence N2 and the associated wash rack area located west of Building 82 were used for aircraft staging, aircraft washing, occasional aircraft interior painting and engine checkout. Operations at this blast fence were generally associated with activities conducted in Building 82, as discussed in the Lockheed Plant B-6, Parcel 1 assessment (McLaren/Hart, 1991).

4.1.3 Site Inspection

Site inspections of Buildings 82, 82C, 82T, 86, and surrounding yard areas were conducted in April, May, and June of 1991. Buildings 82A, 82B, 82D, and 82E were inspected on August 27, 1991. A description of the inside and outside features in each area is presented below.

4.1.3.1 Interior of Building 82 and Associated Structures

The discussion of the Building 82 site inspection begins with facilities in the west end of the south half of the building and progresses east. Features along the north half of the building are then discussed from west to east. In Building 82, the machine pit beneath the 21,000-ton Verson press contains approximately three inches of hydraulic oil. The concrete floor around the base of the 5,000-pound Verson press has oily dry sweep. The pad for the former hydraulic press north of the large Verson press has minor oily stains. The concrete is oily near the two freezer compressors south of the large Verson press. The freezers and utility pits in the hydraulic press area are clean. The concrete floor beneath the shrinkers and stretchers, which are located east of the hydraulic presses, has minor oily stains. There is no staining on the floor near the contour former. The concrete floor beneath the hydraulic pump motors of the two draw formers has minor oil staining. The largest draw former has oil and dry sweep around its base on the concrete floor. The routers and drill presses east of the draw formers use a soluble oil coolant. The concrete floor beneath the southernmost drill press and the duplicator router is stained with oil and the wall behind the duplicator

router is stained with coolant oil. No staining was noted near the recently relocated spin lathes and roller. The north half of the two-stage sand trap that received Cerrobend cooling water discharge is dry and contains sediment. The south half is full of a milky-colored liquid. The area around the northwest corner of the sand trap has an oily stain that appears to be associated with a compressed air line at this location. The roller east of the sand trap has a stain of lubricating oil on the floor beneath it; the other equipment in this area is clean. The floor in the break area and in the weld shop is clean.

The areas of the former process line containment pit, nearby pit, and sump near column 11 are covered with concrete patches. No stains are present on or near the concrete patches. The concrete floor beneath the shears and power brakes to the east of the former process line has minor oily staining, and there is oily dry sweep around the base of the power brakes. There is oil around the base of the large hydrotel and a drum labelled "90 percent dry sweep, 5 percent oil, 5 percent floor sweepings" is located nearby. The oily staining from the hydrotel extends to the east into a nearby utility pit. The floor of the machine shop is widely stained with oil, except for the southeast corner. Staining and oily dry sweep are most significant near the hydrotels and the hone. The area of smaller equipment has the least staining in the machine shop area. An empty non-flammable materials storage cabinet is located along the south wall near the hydrotel.

In the northern portion of Building 82, the painted concrete floor of the inspection and blueprint control areas is clean. The concrete around the work bench area is clean. There is a minor dark stain near the deburring machine, water staining near the tumble burrs, and a rusty ring stain near the floor sink at column 2.

The floor of the metal storage area between columns 2 and 3 is clean, and the scrap bins are dry and do not appear to have any cutting oil in them. The chemical control crib at column 3 is clean and orderly. The painted concrete floor of the tail pipe assembly area is clean. The hammer room floor is clean. The painted concrete floor beneath the hydraulic punch presses and the shears shows some minor staining. There are no stains in the remnant stock/template storage area or the sheet metal stock storage area in the northeast corner of Building 82.

The ground floor and mezzanine offices at the east end of the Building 82 high-bay are clean. No evidence was noted of the pipe pit shown on facility drawings at the south end of these offices.

The office areas in the 40-foot office bay between Buildings 82 and 82A are clean. No evidence of the former shops, paint room, and labs was noted in the current offices. A janitorial closet at the south end of the second level contained cleaning

supplies such as ammonia and Ajax. The utility area on the mezzanine above the north end of the second floor has debris on the metal plate floor, reportedly from the replacement of the Building 82 roof in 1990. No stains were noted near the air handler units on the mezzanine.

The painted concrete floor of the former induction weld room has no significant stains. No evidence of the former walk-in oven was noted.

The enclosed area in the center of the Building 82A high bay was not inspected because of restricted access. The concrete floor of the corridor west of the enclosed area was clean, except at the northern end, where debris from the roof repairs was noted around the transformer and motor generator. The concrete floor of the eastern corridor was clean. No stains were noted at a dry-type 45-kVA transformer at the south end of the corridor. A supply cabinet in the corridor contains disinfectant, cleansers, and furniture polish.

The offices of Building 82B are clean. No significant chemical use or storage occurs in this area of the building.

The offices in Building 82C are clean. The concrete floor of the equipment room near the floor sink is stained with water, and minor oily stains were noted near the air conditioning compressor. The air conditioning compressor's pipe lagging is deteriorating and is old enough to potentially contain asbestos. The transformer room has minor white staining on the floor near the two dry-type transformers. The electrical vault is clean. A rest room in the northern part of 82C has two floor sinks, and the floor is clean. A janitorial closet in the rest room has a sink, janitorial supplies, and cleansers. A storage cabinet in the rest room contains cleaning supplies.

The tile floor of Building 82D has water stains in the northwest corner from an apparent roof leak. No evidence of the former ozalid machines was noted. The floor sink on the west side of the building was covered with stored metal plates at the time of the site inspection and could not be inspected. The aboveground sink has no significant stains. The area around the electrical pit is clean. The metal plate over the electrical pit could not be opened for inspection. Building 82D is used for storage, primarily of office supplies.

The office areas in Building 82E are clean. A storage cabinet contains paper, and a list on the door indicates that insect spray and graphics supplies such as eradicating fluid, fixative, cleaner, and solvent were formerly stored in the building. A utility area at the north end of the structure contains a 225-kVA dry-type transformer, two switch panels, a filter panel, and a voltage regulator. The bare concrete floor of the utility area is clean. The storage area contains office equipment and files. A platform-mounted air conditioning unit on the east wall of the storage area, reportedly installed in 1990, is clean.

The hydraulic unit is no longer present in Building 86. The pipe trench contains approximately ½-inch of red hydraulic oil. The concrete floor of the building is stained with oil near the trench, extending to the floor sink in the southeast corner. The cooling tower is still present on the roof of Building 86. Air filters are being stored in the building.

4.1.3.2 Interior of Building 82T

The former Building 82T was clean inside at the time of the site inspection. Stains were noted in a sink in the coffee room at the south end of the building. The sewage pipes from the rest rooms were aboveground, suspended below the trailer floors. The pipes were removed with the trailers. No stains were noted at the transformers or air conditioning units.

4.1.3.3 Exterior Areas

A covered employee break area is located at the northwest corner of Building 82 in the location of the former spray paint booth that was decommissioned in 1980. Compressed air lines are attached to the shelters' wooden support columns. No significant staining was noted in this area.

A ground-mounted chiller is located south of the sheltered area. The water chiller reportedly uses ethylene glycol as a cooling agent. No stains were noted in the vicinity of the unit.

Evidence of the former paint booth that was removed in 1976 was noted just east of the covered employee break area. Water and compressed air bibbs were noted at the southwest corner of the former paint booth concrete pad. The concrete was slightly discolored by weathering and perhaps minor paint residue.

Two large concrete pads were noted in the pavement north of Building 82. Both pads appeared to be constructed to support aircraft. Minor oily stains from automobiles were noted on the western pad. No stains were visible associated with its former use as an aircraft parking pad. The larger pad, located approximately 200 feet east of the smaller pad, included a 10-foot long by 4-foot wide metal plate that appeared to be used as a tie-down bracket for aircraft stationed on the pad. No stains were observed on the concrete pad.

Three former aircraft run-up stalls were noted outside the northern exterior wall of Building 82 at columns 1, 2, and 3. The run-up stations each have compressed air and water piping and connections adjacent to the building wall.

An approximately 8,000-gallon air receiver tank was noted at the corner of Building 82 and Building 82D. No stains appeared to be associated with this above ground tank. An additional run-up station was noted just north of the air tank, along

the west exterior wall of Building 82D. This former run-up station has electrical outlets and compressed air bibbs located adjacent to the building wall. A boiler blow down pipe is located adjacent to the stall. An oily stain was visible at the end of the discharge pipe, and minor staining was noted on the asphalt surface.

The roof of Building 82D has two passive vents and one chiller located on it. Reportedly, the chiller uses ethylene glycol as a cooling fluid. Two additional chillers, similar to the roof mounted chiller, are located on the ground surface east of Building 82D. No stains were noted near these chillers.

Evidence of former compressed gas cylinders was noted at the northeast corner of Building 82D. No staining was visible in this area.

A cyclone fence surrounds the exterior of Building 82E. A ground-mounted air-conditioner unit is located adjacent to the west exterior wall, and a ground-mounted chiller is located adjacent to the east exterior wall. No stains were noted near either of these units.

Four utility stations were noted adjacent to columns 10, 11, 12, and 13 on the southern exterior wall of Building 82. The stations contained electrical, water and compressed air hook-ups. No significant stains were noted near any of these stations.

No evidence of the former dust collector just east of column 11 was noted during the site inspection. Substation 82 is currently located in that area. The substation contained one oil-cooled 500-kVA transformer and was labeled as being inspected in November 1989. The label indicated that the transformer did not contain PCBs.

An evaporative cooler and an argon gas tank were noted west of the substation. A cooling tower was present adjacent to the south exterior wall near column 12. The coolers were serviced by ChemPro on a monthly basis. No evidence of water treatment chemicals was noted. No stains were visible in this area.

The asphalt pavement north and south of Building 82 appeared to be recently sealed and showed no evidence of significant staining. Minor fractures and cracks were noted in isolated areas of the pavement around the building.

4.2 BUILDINGS 83 AND 84

Buildings 83 and 84 are located near the center of Parcel 2, Plant B-6, as shown on Figure 4-1. A plot plan of the two buildings and the surrounding yard areas is shown on Figure 4-4. A floor plan for the first story of Building 83 is shown on Figure 4-5. The second and third story floor plans of Building 83 and the floor plan for Building 84 are shown on Figure 4-6.

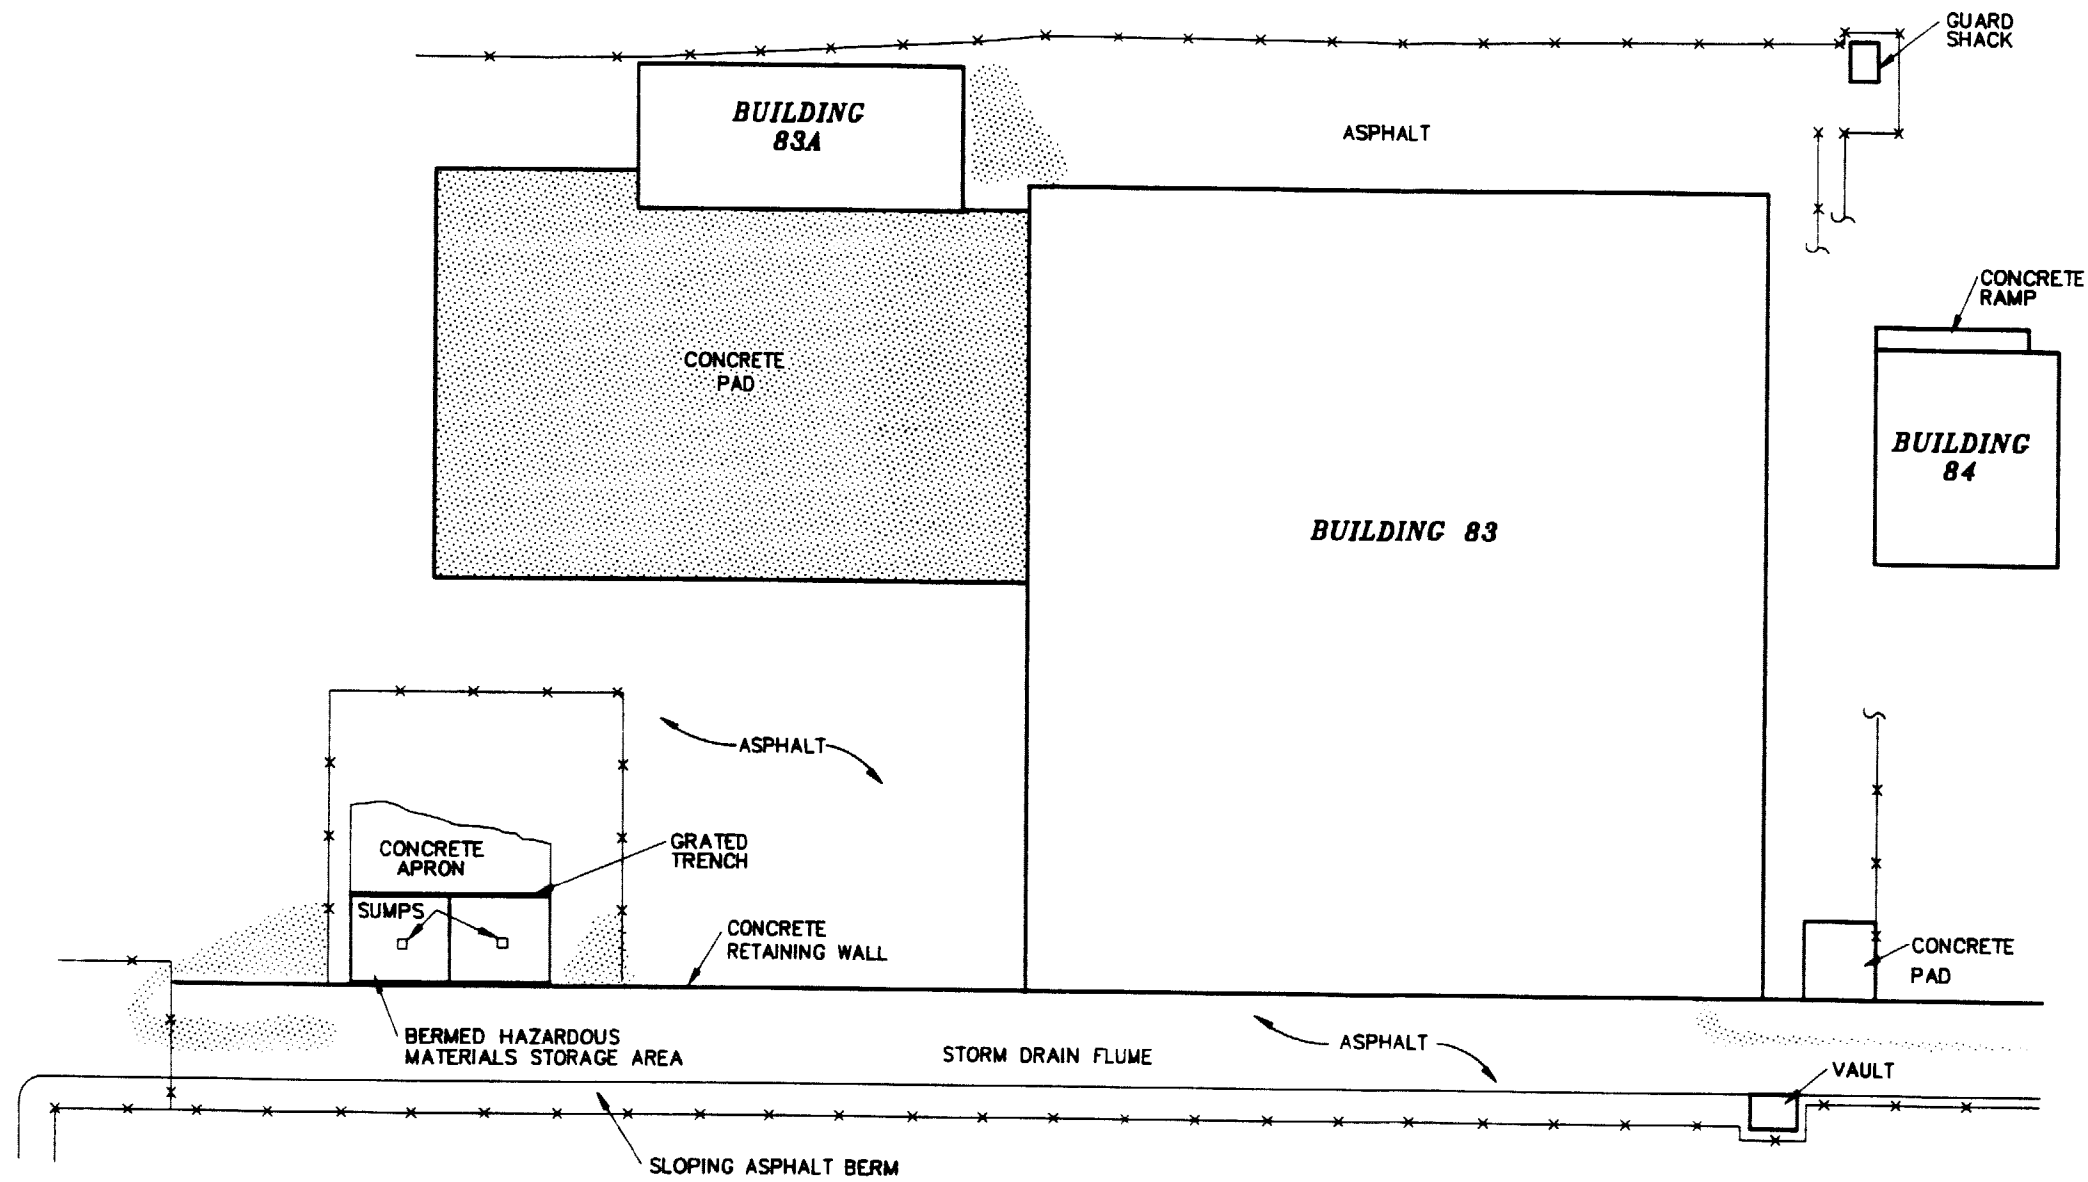

Information on the present and historical use of Buildings 83 and 84 was obtained through interviews and site walks with the following Lockheed personnel: Mr. Ed Banyard Jr., Mr. Bob Diltz, Mr. Leroy Flynn, Mr. George Gardoni, Mr. John Hollinger, Mr. David Jones, Mr. Hans Kluewer, Mr. Don Kreutzfeldt, Mr. Ron Mosher, Mr. Bill Robinson, Mr. A.F. Rudroff, and Mr. Al Weaver. The tenure of these employees covers operations at the Plant B-6 facility since the early 1940s. Discussions of the building construction details, previous operations and present use, previous investigations, and site inspection are presented below.

4.2.1 Construction Details

4.2.1.1 Building 83

Building 83 was constructed in 1942 as a paint hangar. The 25,600-square-foot building consists of a large, open high-bay, which occupies most of the building, and a three-story section on the east end of the building. The high-bay portion of Building 83 is constructed of steel trusses and girders, wood purlins (horizontal timbers supporting the rafters of the roof) and planking and corrugated iron walls. The high-bay has a concrete slab floor with approximately 20 utility pits distributed throughout the hangar. The utility pits contain compressed air and breathing air lines. They each have a drain that discharges to the sanitary sewer lines east and north of Building 83. Four sub-grade exhaust tunnels installed in 1942 and two tunnels installed in 1970 were used for ventilation. The hangar has a total of eight spray paint booths, four along the north wall and four along the south wall. A bermed hazardous materials storage area is located in the northeast corner of the hangar floor in Building 83. Building 83 has a drop ceiling approximately 36 feet above the hangar floor with suspended lights, sprinklers, and vents. Ducts for ventilation, heating, and cooling are located above the ceiling. Lighting in Building 83 is predominantly fluorescent, although metal halide lights were added on the ceiling of the high bay in approximately 1986. The building roof has a sawtooth design of steel and wood beams with corrugated iron sides, composition roofing and wire glass louvered windows. The west side of Building 83 is enclosed with a steel vertical-lift door.

The eastern three-story section of the building shares a wall with the Building 83 high-bay, but access between the two sections of the building only exists on the ground floor. The eastern section of Building 83 has steel and wood framing, corrugated iron sides and composition roofing. The floors of the eastern wing of Building 83 are concrete and wood. Interior walls in the eastern wing are plaster. The first floor contains a rest room, a paint mix/paint storage room, a former boiler room (now a heat exchanger room and a break room), and a compressor room, as shown on Figure 4-5. The rest room located at the northern end of the first floor has ceramic tile floors and walls and a wooden roof. The paint mix/paint storage room, located south of the rest room, is explosion-proof and has incandescent lighting. The room is subdivided by a partition into north and south halves. A boiler room formerly occupied the portion of Building 83 south of the paint mix/paint storage room. The southern portion of the boiler room was converted to a break room, locker room, and office space after 1978. The break room has three wall-mounted air conditioners. A concrete stack for former boilers is located in the southern portion of the former boiler room and extends to above the sawtooth roof. This portion of the former boiler room also has electrical panels along its east wall. The northern portion of the former boiler room is currently divided from the break room by a wall, and it contains a heat exchanger, air supply fan, hot water pipe pit, steam condensate pump, and hot water circulating pump from the former boiler room. The southernmost area in the eastern wing of Building 83 has been a compressor room since its construction in 1942. Two compressors with 300-hp motor starters are situated on concrete pads at either side of a 7.5-foot deep pit that contains utilities for the compressors. Two air pressure tanks are located in a two-foot deep pit in the northwestern corner of the room. An electrical panel is located next to the air pressure tanks.

The second story of the east wing of Building 83 consists of, from north to south, an electrical room, an air filter room, another rest room, a manager's office, and a computer room, as shown on Figure 4-6. The electrical room, located on the north end of the second story, currently contains 150-kVA and 750-kVA dry-type transformers and switch panels. The air filter room has the air intakes and hot and cold plenums for the Building 83 heating and ventilation system. The computer room on the south end of the second floor has a tile floor, acoustic tile ceiling, and fiberglass insulation.

Only the central portion of eastern wing, over the air filter room, has a third story, as shown on Figure 4-6. It contains the fans and ducting for the Building 83 ventilation system.

4.2.1.2 Building 84

Building 84 was constructed in 1978 to 1979 as a boiler room. The 1,710-square-foot building has metal trusses, corrugated metal siding and a concrete floor. The building contains the three boilers, which are shown on Figure 4-6, that now provide heat for Building 82, located to the north. The building has a grated pipe trench that varies from 12 to 19 inches in depth and drains to the southeast corner of the building. The west wall contains three sets of louvers for ventilation. The boilers vent through the building roof. The interior of the building is illuminated with mercury-vapor light fixtures.

4.2.1.3 Exterior Areas

The yard around Buildings 83 and 84, shown on Figure 4-4, is paved with asphalt. A storm drain flume that runs along the entire length of the south side of Building 83 has a concrete retaining wall on the north, a sloping asphalt berm on the south, and an asphalt floor. A hazardous material storage area approximately 20 feet by 40 feet is enclosed by a 60-foot by 60-foot fenced area that is located 85 feet west of Building 83. The storage area is covered with a metal canopy that has incandescent lighting and an overhead sprinkler system. The storage area has a concrete floor and concrete spill containment berms on three sides and bisecting center of the area, dividing it into a west half and an east half. Each half has a grated, closed sump in its center. A grated trench is at the north end of the bermed concrete floor. There is a concrete apron north of the grated trench, and the remainder of the fenced area is paved with asphalt. There is a large concrete pad at the northwestern corner of Building 83, and a covered bulk supply storage area north of the pad that is designated Building 83A. There is a concrete three-stage clarifier located approximately 25 feet north of Building 83, as shown on Figure 4-5. The clarifier is approximately 9 feet long by 6 feet wide by 6 feet deep. Discharge from floor drains and floor sinks inside Building 83 is directed to this clarifier, which discharges to the City of Burbank sanitary sewer system. Two 4-foot deep, gravel-bottomed compressed air pits are located near the northwestern and northeastern corners of Building 83. The western pit contains a moisture trap for the air lines from the Building 83 compressors. Except for small concrete pads for equipment described below, the remainder of the yard is paved with asphalt. A guard shack northeast of Building 83 has a wood frame and wood paneling.

4.2.2 Previous Operations and Present Use

4.2.2.1 Building 83 Interior Operations and Use

Building 83 was used as a paint hangar from the time of its construction in 1942 until December 1990. Early activities in the building included aircraft washing, painting, and dope fabrication, which is a build-up process using cellulose nitrate or a similar

material, for Constellations and P-2V Neptunes. From the early 1960s to the early 1980s, the P-3 Orion was the primary aircraft painted in Building 83. The S-3A Viking was also painted in Building 83 in the 1970s. After assembly in Building 304 or 309, aircraft were brought to Building 83 for painting. Smaller parts and sub-assemblies were also painted in the building. The aircraft were wiped down with ketone solvents or a petroleum-based solvent cleaner using clean cloths prior to painting. A mild acidic cleaner was also wiped on the aircraft skins with clean cloths prior to painting. Wax, oil, or silicone parting agent that may have been a residue from the manufacturing of the metal part was removed by applying TCA or toluene with clean cloths or synthetic sponges and wiping the metal dry with clean cloths. Excess sealant or zinc chromate primer was removed with MEK using clean cloths or abrasive pads. Phosphoric acid cleaner and alodine were applied with fiber bristle brushes or clean cloths and removed with a clean water spray rinse to prepare some exterior surfaces. Throughout the building, interior and exterior primers and top coats were applied to aircraft. Interior painting and touch-up painting of exterior scratches were also conducted outside at the flight line west of Building 82. Paint spray guns with pressure pots were supplied with compressed air from utility pits located at regular intervals on the hangar floor. The guns, paint lines, suction feed cups, and pressure pots were flushed clean mainly with MEK, chlorinated cleaner, lacquer thinner, toluene, or acetone. The cloths used for application and removal of solvents and cleaners were disposed of in safety cans. When the cans were filled, they were emptied into covered metal bins for disposal off-site. It is not known how solvents, cleaners, and paint gun cleaning liquid waste was disposed at Building 83 prior to the 1980s. However, the general practice at Plant B-6 was to place such liquid wastes in 55-gallon drums for disposal off-site.

Paint stripping also reportedly occurred inside Building 83 and outside on the concrete pad located at the northwest corner of the building. Paint strippers were applied using abrasive pads. Paint stripper that dripped to the floor inside the building was washed or swept either to the nearest floor grate, to the outside of the building through the hangar door, or under the corrugated iron wall on the south side of the building to the storm drain flume. Dope fabrication was a build-up process conducted primarily on the tail of the Constellation. The dope used was likely a cellulose nitrate material with a paste-like consistency that was thinned with solvents such as MEK or glycol ethers.

In approximately 1961, a traveling paint booth known as a "howdah" was installed in the southern portion of Building 83. The howdah was reportedly relocated from Building 351 and it is described in greater detail in the Plant B-6 Parcel 1 Environmental Assessment Report (McLaren/Hart, 1991a). It was removed from Building 83 in approximately 1985. The howdah had a spray booth on each side of the unit that allowed personnel to paint an assembly such as a fuselage or wing as the unit travelled over the assembly. According to SCAQMD air permits, the howdah was approximately 28 feet wide, 21 feet long, and 32 feet high, and was powered by four 4-hp elevator drives. Air was drawn from the unit through twenty-

six 18-inch by 24-inch exhaust filters by two 10-hp exhaust fans and was discharged through vents on the roof. The method of disposal for the filter elements is not known.

Building 83 originally had four steel-grate-covered, downdraft exhaust pits that served to remove paint fumes from the building. The exhaust pits are shown on Figure 4-5 in the northern portion of the hangar. Four 45,000-cubic-foot-per-minute (cfm) exhaust fans, originally located on the roof, drew air out of the building through the exhaust pits and the concrete underground ventilation tunnels to sheet metal ducts on the north outside wall of the building. The fans were relocated from the roof to concrete pads just north of Building 83 in approximately 1951. Design drawings dated 1941 show that air passed down into each of the four exhaust pits, through a water washing system, and into the respective underground tunnel. A circulating pump for the water washing system was located in a pit adjacent to each exhaust pit. The floor of each exhaust pit had a 4-inch drain that discharged to a sump pump and then to the 6-inch sewer line located east of Building 83. The pit for each circulating pump had a 2-inch drain that also discharged to the sump pump and sewer. Although the drains and sump pumps were designed to remove wash water system overflow, it is possible that liquids discharged to the pits from painting and cleaning activities inside Building 83 may have also entered the drains.

Three of the four exhaust pits and all four circulating pump pits have been filled with concrete. It is not known when the two central pits were filled, although the southernmost of the two central pits is called out as "existing pit to remain" on a facilities engineering drawing dated 1969. The westernmost pit was filled in approximately 1984 when the paint robot, discussed below, was installed. The easternmost exhaust pit was reportedly used after approximately 1982 for temporary containment of liquid waste generated by painting, coating, and cleaning operations. Solids and heavy sludge were reportedly separated from the liquid waste, which was then poured into the pit. The solids were placed in 20-gallon containers for off-site disposal as hazardous waste. Both water and solvents were used for spray gun cleaning. The drain for the pit is reportedly not used, and the pit was pumped out every three to six months for off-site disposal of the liquid waste by a licensed contractor. The steel grate over the exhaust pit was also used for temporary storage of pallets of drums awaiting disposal as hazardous waste.

The four original downdraft exhaust pits were replaced in 1970 by two 83-foot long exhaust tunnels in the central and southern portions of the hangar floor. The three westernmost fans for the original downdraft system were removed from the concrete pads along the north outside wall of Building 83 at this time. Air entered each of the two tunnels through six steel grates and was drawn through a concrete and sheet metal tunnel by a 75-hp exhaust fan. The two fans are located on adjacent raised platforms outside the northwest corner of Building 83, where they discharged the exhaust to the atmosphere. The air was filtered by a dry filter system located at the entrance of each exhaust tunnel. The filter element was changed out as needed by

the Maintenance Department, and the used filters were disposed as hazardous waste. The original air permits for the exhaust tunnels noted that each exhaust tunnel had six 6.5-foot by 8-foot Roll-o-matic exhaust filters. It is not known if these filters were wet wash or dry filters. However, it is likely, based on notes on an as-built drawing dated 1970 and the history of the paint spray booths described below, that the tunnels originally had a wet wash system that was changed to a dry filter system in approximately 1980. Four 3-inch floor drains located in each exhaust tunnel drained to the sanitary sewer through a duplex sump pump located near the center of the northernmost tunnel and a three-stage clarifier located approximately 25-feet north of Building 83. The drains may have been designed to remove wet wash system overflow, but like the drains in the original exhaust pits, they may have received liquids discharged to the pits from painting and cleaning activities inside Building 83. The two westernmost grates of the northern set of six steel grates were filled prior to installation of the robot in approximately 1984.

Four paint spray booths located along the north wall of Building 83 were installed in 1970, at approximately the same time as the newer exhaust tunnels. The spray booths were reportedly used for painting parts that were brought into the booths on 6-foot, 8-foot, or 12-foot long rolling tables. The booths are vented by 25-hp exhaust fans located on platforms along the north outside wall of Building 83. The paint spray booths originally had a Roll-o-matic wet wash filter system. According to the 1970 as-built drawing, the wet wash filter system discharged wash water to the sanitary sewer through the clarifier noted above. The wet wash filter system was reportedly changed to a dry filter system in the late 1970s. The media for the dry filter system is changed by the Maintenance Department as needed, depending on use, and the used filters are disposed as hazardous waste. Air permits for the spray booths and exhaust tunnels were obtained from SCAQMD on July 29, 1970 and are still current.

Four spray booths located along the south wall of Building 83 were installed in approximately 1985 and replaced the howdah, which was removed from the building at that time. The spray booths were used to paint smaller parts, as the capability of the howdah to paint an entire fuselage at one time was no longer needed. They are vented by 10-hp exhaust fans on the south outside wall of the building. The spray booths each have sixty 20-inch square pop-out filters, which are changed out as needed by Maintenance Department and disposed as hazardous waste. Air permits for the spray booths were obtained from SCAQMD on March 14, 1986 and are still current.

Building 83 was converted for use by the Advanced Development Projects group in the early 1980s. Paints and coatings were applied to classified aircraft until December 1990. In late 1984 or early 1985, a robotic spray-painting system was installed in Building 83. The robot moved from station to station on a cart guided by wire set in the floor of the hangar. Polyurethane paint, ceramic-type coatings, and other materials to be applied were placed in a 5-gallon bucket on the robot. The

coating was pumped out of the bucket and applied to the appropriate part. The painting programs of the robot were controlled from a computer room located on the second floor of the eastern portion of Building 83. The motion of the robot was controlled hydraulically, and it had a 50-gallon reservoir of hydraulic oil for the self-contained hydraulic system. After the hangar floor and gratings became coated as a result of the build-up of paint and coating from overspray, the floor had to be bead-blasted in early 1989. Use of the spray paint booths continued after the installation of the robot. The robot was dismantled and removed from the building in 1991.

Paints and chemicals used in Building 83 have included acrylics, alodine, cleaners, enamels, epoxy, epoxy enamel and epoxy primer, lacquers, polyamides, polyurethanes, resins, solvents, strippers, thinners, acetone, acids, alcohols, MEK, TCA, TCE, toluene, and xylene. Components of these products, in addition to the volatile organic compounds named above that are used as neat products, include ammonia, barium, benzene, chromium compounds (including barium chromate, sodium chromate, strontium chromate, zinc chromate and chromic acid), cellulose nitrate, dibutyltin dilaurate and other organo-metallic compounds, 3-ethoxy-ethyl ester propionic acid, ethylbenzene, 2-ethoxyethanol and other glycol ethers, iron, lead, methylene bis (4-cyclohexyl) isocyanate, methylene chloride, MIBK and other ketones, naphtha and other aliphatic hydrocarbons, n-butyl acetate and other acid anhydrides, triethylamine and other amino compounds, nitroethane, phenol, polymethylene and other polymers, potassium ferricyanide, potassium fluoroborate, potassium fluorozirconate, propane, silica, silver, sodium fluoride and other salts, and titanium dioxide. According to internal Lockheed estimates made in the mid-1980s, monthly product usage at Building 83 included approximately 80-gallons of topcoat and 40-gallons of water-based primer, containing 6.3 and 4.2 pounds of volatile organic compounds, respectively. Monthly usage of cleaning solvents was estimated at 80-gallons of MEK, 50-gallons of IPA, and 50-gallons of naphtha. As described above, waste solvents were discharged to the exhaust pit in the northeast portion of Building 83 for temporary containment, pending pumping of the pit and off-site disposal of the liquid as hazardous waste.

The southeast corner of the Building 83 hangar was formerly a dope fabrication room. Although it was not found in the original 1941-1942 design drawings, the dope fabrication room was noted in a Factory Mutual map dated approximately 1948 and a facilities design drawing dated 1954. The dope fabrication room measured 20 by 42 feet with a roof at approximately 12 feet above the floor. The 1954 drawing showed the addition of an exhaust system that vented to the atmosphere outside the south side of Building 83 by means of a 3/4-hp explosion-proof motor and 3,700 cfm exhaust fan. No sumps, drains, or pits were shown in the room.

Prior to approximately 1980, paints and chemicals were stored in small quantities throughout Building 83. The bermed hazardous materials storage area was constructed in the northeast corner of the hangar floor in approximately 1980, and

numerous drums of solvents and strippers were stored in the area until approximately 1988. After approximately 1988, the hazardous materials storage area commonly contained one drum each of wipe solvent, alcohol, and naphtha for use inside Building 83.

During the 1980s, a mixer of approximately 20-gallon capacity was located against the east wall of the hangar, southeast of the hazardous materials storage area. Coatings, primarily for application by the robot, were mixed from dry and liquid components in the mixer.

The paint mix/paint storage room on the north end of the eastern portion of Building 83 has been used for the storage of paints and, more recently, solid components of resins. The north half of the room has three cabinets located along the east wall for the storage of shop supplies such as spare parts, gloves, and tape. A refrigerator was formerly located against the north side of the room's east-west partition. The partition has vents that extend from approximately 8 inches above the floor to the ceiling to remove fumes from the room. Another vent is located on the west wall of the paint mix room. A fume hood is located over a paint mix booth at the west end of the partition on the south side. According to facilities drawings, the fume hood and paint mix booth were installed in 1976. A floor drain under the paint mix booth and a concrete lab sink located east of it discharged to a 2-inch sanitary sewer line that drains to the east, where it connects to the existing sewer line outside Building 83. The lab sink reportedly was used for the disposal of various liquids associated with the paint mix room. Another shop supply cabinet is located on the west wall of the room. Reportedly, a flammable materials storage cabinet and an acid storage cabinet were formerly located adjacent to this shop supply cabinet. Electrical outlets are present along the south wall, where work benches were formerly located. The work benches reportedly contained equipment including scales, shakers, and a Hobart mixer. According to facilities drawings, the paint mix room was remodeled to its present configuration in approximately 1984. At that time, a fenced enclosure north of the east-west partition was removed. Unspecified equipment within the fenced enclosure was also removed from Building 83 during the remodeling. An air conditioning unit was installed on the roof of the rest room adjacent to the paint mix room at that time. Blowdown from the air conditioning unit discharges to a drain outside the north wall of Building 83. A Carrier split-system air conditioning unit located on a concrete pad near the northeast corner of Building 83 is connected with the 1984 air conditioning unit, but was not noted on drawings. A freezer was shown located along the western wall, according to the 1984 drawings.

The central portion of the first floor of the eastern wing of Building 83 formerly housed six boilers. The boilers were used until 1978, when Building 84 was constructed with three new boilers and the old boilers were removed from Building 83. The former and current boilers can be fueled by either natural gas or diesel (#2 fuel oil). The diesel fuel oil is stored in a 10,000-gallon underground tank,

which is designated B-6-F5, located outside Building 83, approximately 10 feet east of the former boiler room (see Figure 4-6). The tank is still in service to provide fuel for the boilers in Building 84. Soil investigations and underground tank program compliance activities at this location are described below in the Previous Investigations section. The boilers heated water to provide space heat for Buildings 82 and 83 and to provide steam to heat process lines in Building 82. Currently, the three boilers in Building 84 are used only for providing comfort heat to Building 82. The heat exchanger, supply fan, pipe pit, and steam condensate return pump in the northern portion of the former boiler room of Building 83 are still in use for the heating system, using the boilers in Building 84. The steam condensate return pump discharges to a feed-water tank in Building 84. A sand trap and sump are located at the west wall of the heat exchanger room. The sand trap and sump collect condensate from the heat exchanger and discharge to a 3-inch sewer line beneath the boiler room that drains to a 6-inch sewer line along the east side of Building 83. A former 18-inch deep pipe trench for the gas line under the boilers led to a floor drain located beneath the northernmost boiler. The floor drain, which potentially may have received any leakage from the fuel oil supply and return lines, oil filters, and pressure safety valves, discharged to the same 3-inch sewer line that drains effluent from the sand trap and sump. An office cubicle and lockers were installed in the southern portion of the former boiler room in the late 1980s.

Two 300-hp air compressors in the compressor room in the southeastern portion of Building 83, along with the compressor in the Building 360 blast fence, provide plant-wide compressed air for Plant B-6. The present two compressors in Building 83 were built in 1981; it is not known when the original compressors, installed at the time of building construction in 1942, were replaced. Reportedly, compressor oil and filters are changed after every 1,000 hours of operation by the Lockheed Maintenance Department. Fifty gallons of oil are added every time the oil is changed. Waste oil is stored in 55-gallon drums and transported off-site by a licensed hauler for recycling or disposal.

The 7.5-foot deep pipe pit between the compressors contains air aftercoolers, moisture separators, and a sump for the collection of compressor condensate and oil. Until 1976, oil from the compressors was collected in the pit and drained into a 5-inch diameter overflow pipe leading outside to the storm drain flume south of Building 83. Dark stains originating at the compressor oil drain and extending eastward in the storm drain flume south of Building 83 have been noted in aerial photographs from 1945 to 1983. In 1976, the 5-inch drain was altered to serve only as an emergency drain. A sump pump was installed in the bottom of the pit to pump waste oil to an existing sand trap that is located outside the compressor room. The sand trap discharges to the sewer line east of Building 83.

Prior to 1976, aftercooler blowdown from the Building 83 compressors discharged to the sanitary sewer system or was collected in 55-gallon drums for off-site disposal. In 1976, a 5,000-gallon tank for blowdown was installed east of Building 83.

Blowdown was directed through a small blowdown tank that was located outside the boiler room to the 5,000-gallon tank. The tank also received blowdown from the boilers in Building 84 from 1978 through 1987, as discussed below. The tank was pumped periodically, and the waste liquid was disposed off-site. The 5,000-gallon tank is referred to as a "waste oil tank" in facilities drawings. The tank received an oil-water emulsion from the air compressor aftercoolers that was analyzed in 1976 and found to contain 0.53 percent oil. In approximately 1987, the piping to the tank was removed and the aftercooler and boiler blowdown lines were rerouted back to the sanitary sewer. The 5,000-gallon tank was removed in 1991. Soil investigations at the tank, designated B-6-B, are described below in the Previous Investigations section.

The electrical room at the north end of the second story of Building 83 (see Figure 4-6) originally contained three 37.5-kVA and three 200-kVA single-phase transformers for light and power, respectively, as indicated by facility drawings dated 1941. The electrical room also contained oil fuse cutouts and switch panels for power and light in Buildings 82 and 83. A facilities drawing dated 1965 indicated that the oil fuse cutouts and an oil circuit breaker were removed and delivered to the Salvage Department at Plant B-1. The existing 37.5-kVA and 200-kVA transformers were to remain. Old switches were removed and new high voltage switches for the compressors and Building 83 power and lighting were installed. An internal Lockheed survey of electrical substations and high voltage motor starters, dated March 1968, noted a 100-kVA transformer for lighting and a 600-kVA transformer for power in Building 83 (presumably the three 37.5-kVA and three 200-kVA transformers, respectively). Both units were identified as assembled installations that were cooled with non-flammable liquid. Two 300-hp high voltage motor starters for the air compressor units on the first floor of Building 83 were also noted on the survey. A 1970 as-built drawing identifies the light transformers as 50-kVA; apparently, the 37.5-kVA units had been replaced with these larger units.

Another internal survey, dated February 1979, noted that the 200-kVA transformers in Building 83 contained 95 gallons of liquid each, while the 50-kVA transformers contained 41 gallons of liquid each. Lockheed written documentation, a facilities drawing dated 1985, and interviews with Lockheed personnel indicate that the transformers developed leaks of the synthetic cooling fluid Askarel, which contained PCBs, in approximately 1984. In 1985, IT Corporation drained and flushed the transformers, stored them temporarily on the hangar floor located below and west of the electrical room, cleaned the Askarel off the floor of the electrical room, and disposed of the transformers and liquid in accordance with EPA requirements. The original transformers were replaced in 1985 by the present 150-kVA and 750-kVA dry-type, three-phase transformers.

An air filter room occupies the central portion of the second story of Building 83. As described in Construction Details above, the room contains equipment for the Building 83 heating and ventilation system. No chemical use is reported in the air

filter room. The southern portion of the second floor of the east wing of Building 83 was originally divided into a rest room and three small rooms that have been used as offices, a storage room and a locker room. The two southernmost offices were combined in 1985 into a remote computer room to house the computer controlling the automated robot spray painter. According to a facilities drawing dated 1984, a 5-ton air conditioning unit was installed at the south end of the computer room with refrigerant lines that run in a closed-loop system to a condensing unit on the roof above the computer room and condensate drain lines that run to the compressor pit on the first floor of Building 83. Except for household cleaning products, no other chemical use is reported in this portion of the second floor, or in the central portion of the second floor.

The third floor of Building 83 contains the fans, dampers and ducting for the heating and ventilation system for Building 83. The ventilation ducts extend to the west over the drop ceiling of the high bay, where the vents discharge air through the ceiling to the hangar below. No chemical use or storage occurs on the third floor of Building 83.

According to Lockheed records, three hazardous material incidents occurred around Building 83 during 1989 and 1990. Lockheed Environmental Protection and Safety Organization (EPSO), Lockheed Fire Department, and Burbank Fire Department personnel responded to a reported odor similar to an electrical fire in Building 83 on December 4, 1989. One employee from Building 83 experienced eye, throat, and nose irritation and approximately six employees experienced lightheadedness and nausea. All readings taken at the site were negative, and the incident was attributed to carbon monoxide from the exhaust from the boilers in Building 84 entering the Building 83 air intake. Another incident nine days later occurred when a possible electrical fire odor was detected. No symptoms were experienced by building personnel, and the cause, which may have been a lighting ballast or a building heater, was listed as unknown. The third incident occurred on September 5, 1990, when approximately one quart of diesel fuel leaked out of the fill port of the underground tank east of Building 83, onto the concrete pad capping the tank. The tank had been overfilled and the fuel expanded. The problem was solved by pumping approximately five gallons of fuel out of the tank and cleaning up the spilled fuel.

4.2.2.2 Building 83 Exterior Operations and Use

The storm drain flume located south of Building 83 was also used as a driveway in the 1940s and 1950s. It drains east to a culvert at Hollywood Way and receives surface runoff from a large portion of Plant B-6 north and west of Building 83, as well as discharge from the compressor room pit drain. As described above, the pit routinely discharged to the storm drain flume from 1942 to 1976, and only discharged to the storm drain flume in emergency situations after 1976.

The area west of Building 83 has been used primarily for storage since the building was constructed. Storage sheds have been noted along the north side of the storm drain flume fence on aerial photographs from 1945 through 1983, and miscellaneous ground support equipment, parts for aircraft, and 55-gallon drums have been identified outside them. Lockheed flight line personnel stated that the sheds were used for support of the flight line at blast fence N-1 for the B-17 Flying Fortress, which was produced in Burbank from 1942 to 1945. The sheds were reportedly used later for the storage of paint and paint thinner. A "No Smoking" designation on the asphalt pavement north of three of the sheds, noted on a photograph dated August 3, 1945, suggests that flammable materials may have been stored in the sheds. A 1945 photograph shows evidence of liquid flowing southward across the pavement from the westernmost small shed into the storm drain flume. The composition of the liquid is unknown. This shed is designated as a guard house on one contemporary plot plan. As many as 65 drums were noted around the sheds in a 1946 photograph, and significant drum storage continued into the early 1960s. Drums were also noted near the northeastern corner and along the eastern outside wall of Building 83 on aerial photographs from the same time period. However, chemical storage east of Building 83 was not confirmed by later photographs or by discussions with Lockheed personnel. Reportedly, both virgin and waste chemicals were stored in the area southwest of Building 83. Although leakage from one drum west of Building 83 and north of the storm drain flume was visible on a low angle oblique photograph dated November 21, 1957, the yard west of Building 83 generally showed no significant staining on the aerial photographs reviewed.

Two wooden sheds, which were designated 317 and P-107 on a Factory Mutual Map dated 1965, were noted on photographs from 1950 through 1964 in the area along the north side of the storm drain flume west of Building 83. The sheds were 30 feet by 15 feet and 36 feet by 15 feet, respectively, with a 10-foot by 10-foot shed between them. Building 317 was shown on the 1965 map as being used for the storage of plaster molds. Building P-107 was shown as being used for the storage of paint remover in drums. Various configurations of smaller sheds were noted west of Building 317 through the years. Buildings 317 and P-107 were shown on a June 1966 plot plan of Plant B-6 but were not shown on a facilities map dated June 1967. The existing Building 317, which houses the Fire Department, was constructed on Parcel 1 in 1967. No sheds were noted in the area in photographs from the late 1960s and 1970s. The current hazardous materials storage area west of Building 83 (see Figure 4-4) was built in approximately 1981. Flammable materials for use in the ADP area were relocated from the hazardous materials storage area south of Building 349 to the Building 83 hazardous materials storage area in approximately 1983. Hazardous waste that was transported from Building 83 under manifest in 1988 and 1989 included MIBK and a solid ferric coating compound.

A large concrete pad has been located immediately west of the northern portion of Building 83 since the building's construction. The pad has been used for miscellaneous storage, aircraft parking, and some paint stripping activities. Most of

the storage and aircraft parking noted on aerial photographs occurred on the northern portion of the pad. In approximately 1986, a covered bulk storage area, designated Building 83A, was built at the north edge of the concrete pad for the storage of shop supplies for Building 83. Reportedly, no chemicals are stored in Building 83A.

A breathing air system that was installed in 1970 for Building 83 is located on a concrete pad outside the north wall of the building and consists of a compressor, a refrigerated air drier, and a carbon monoxide analyzer. Blowdown from the air drier and a drain line from the compressor discharge to a floor sink, located at the west end of the concrete pad, that discharges to the sanitary sewer. The original breathing air system was reportedly not used after the early 1980s and it was replaced in 1989 by two Delmonics 400 units located on covered concrete pads along the north and south walls of Building 83, respectively, as shown on Figure 4-5. The Delmonics breathing air units were removed in early 1991.

The three-stage clarifier described in the Construction Details section above was installed in approximately 1970. It receives discharge from floor drains and floor sinks inside Building 83 and discharges to the City of Burbank sanitary sewer system. A battery charger located near the northwest corner of Building 83 was used for electric forklifts used in Building 83. The two compressed air pits near the northwestern and northeastern corners of Building 83 contain valves for the plant-wide compressed air system that originates in the Building 83 compressor room. Other equipment located on the north side of Building 83 is discussed in the Site Inspection section below.

Building 84 and the area east of Building 83 are shown on Figure 4-6. The yard is paved with asphalt. A Baltimore Aircoil Company cooling tower is located on a concrete pad east of the southeast corner of Building 83. The cooling tower, which cools the air aftercoolers for the two compressors inside Building 83, drains its blowdown to the sand trap outside the compressor room and then to the sanitary sewer. The original cooling tower for the compressors was located on the roof of the second story above the compressor room. In 1955 the cooling tower was moved from the roof to the concrete pad, and in 1965 the cooling tower was replaced. A 10-inch fire main and a 4-inch domestic water supply pipe are located on the pad east of the cooling tower.

4.2.2.3 Building 84 Operations and Use

As described above, Building 84 was built in 1978 to house three boilers that are currently used to provide comfort heat for Building 82. The 5,000-gallon underground blowdown tank (B-6-B) for the boilers in Building 84 and air compressors in Building 83 was removed and reinstalled approximately 12 feet to the south to make room for Building 84. Two Cleaver-Brooks 350-hp boilers and one 150-hp boiler were installed in Building 84 over 12-inch thick concrete platforms.

The feed-water tank for the boilers is located in the northeast corner of Building 84. The feed-water tank also receives condensate return water from the heat exchanger in Building 83, as described above. The water-treatment system for the boilers in Building 84 is maintained by Chem Pro. Water-treatment chemicals are stored in drums along the east wall of Building 84, next to the feed-water tank. Blowdown from the boilers originally discharged to a surge tank on a concrete pad along the south outside wall of Building 84 and then into the 5,000-gallon tank. In 1987, the blowdown piping was connected directly to the sewer. The boilers are fueled by the 10,000-gallon underground diesel fuel oil tank B-6-F5, located outside Building 83. The pipes for blowdown, fuel oil supply and return, medium pressure gas, and pilot gas for the boilers are in a concrete pipe trench in the building. The trench has 6-inch thick reinforced concrete bottom and sides. Overflow from the boiler feed-water system tank discharges to the pipe trench. The trench has a floor drain at its south end that formerly discharged to the 5,000-gallon tank and now discharges to the asphalt pavement outside the southeast corner of Building 84 and thence to the storm drain flume. The floor drain receives surface wash water from cleaning of the boiler room floor, as well as the feed-water system overflow.

4.2.3 Previous Investigations

Tank B-6-F5 was investigated by Gregg and Associates in 1984 during the LASC Underground Storage Tank Leak Detection Program. Two 15-foot deep borings were drilled at either end of the 10,000-gallon fuel oil tank, and the borings were completed as vapor monitor wells. Soil samples were collected at the 15-foot depth interval in each boring. The samples were composited and analyzed for TPH, and 7.71 ppm were detected. Gregg and Associates concluded that the tank was not leaking. ENSR investigated tank B-6-F5 in 1988 with one 40-foot deep soil boring and collected samples at depths of 5, 10, 15, 20, 30, and 40 feet. The 15- and 40-foot soil samples were discretely analyzed for TPH and less than 10 ppm was detected in each sample. ENSR installed and sampled three vapor probes at a depth of 3 feet and reported that "trace to background hydrocarbon vapor levels [were] present" in the vicinity of tank B-6-F5. ENSR attributed the vapors to minor spilling at tank filling and concluded that "no hydrocarbon impact exists in the soil at depth." A July 1990 ENSR report indicated that tank B-6-F5 had tested tight, and that a tank level monitoring system and overspill protection box had been installed. No dates for the installations or tank integrity testing were provided in the report.

Underground tank B-6-B was located south of the southeast corner of Building 84; this 5,000-gallon tank received blowdown from boilers in Building 84 and air compressors in Building 83. Gregg and Associates investigated the tank in 1984 with three soil borings, two of which were completed as suction lysimeters. Two 40-foot deep borings were drilled at either end of the tank and were sampled at depths of 5, 17, 22, 30, and 40 feet in one boring and 5, 10, 18, 32, and 40 feet in the second boring. The soil samples were analyzed for pH, which ranged in value from 6.7 to 7.9. The northern boring was completed as a suction lysimeter and the southern

boring was backfilled. A 12-foot deep boring was drilled on the east side of the tank, sampled at 12-feet and completed as a suction lysimeter. A soil sample from the boring was analyzed for volatile organics and pH and the analysis detected the following compounds: 0.047 ppm carbon tetrachloride, 34 ppm carbitol, 0.014 ppm 1,2-dichloroethylene, 15 ppm cellosolve acetate, and a pH of 7.6. The liquid in the tank was sampled and analyzed for CAM metals and pH. Although several metals were detected (barium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, silver, thallium, vanadium, and zinc), all the detected concentrations were less than STLCs. The liquid pH was 2.97. Gregg concluded that "medium concentrations of alcohols" (34 ppm carbitol) detected in the soil were due to surface spills rather than a tank leak. Gregg also noted that rust-colored staining near the south side of the tank indicated that the tank periodically overflowed. The piping to tank B-6-B was disconnected by Lockheed in approximately 1987. ENSR declared in 1990 that tank B-6-B was exempt from underground storage tank compliance because the substance stored in the tank contained less than 1% hazardous materials. Tank B-6-B was removed in 1991, and excavated soils were backfilled into the excavation. Soil samples were not collected from the excavation. The tank closure activities are documented in the March 5, 1991 EMCON and Associates Tank B-6-B Closure Report (EMCON, 1991).

4.2.4 Site Inspection

Site inspections of Buildings 83 and 84 and the surrounding yard areas were conducted in April and May of 1991. A description of the inside and outside features is presented below.

4.2.4.1 Interior of Building 83

The concrete hangar floor of Building 83 is in fair condition, with numerous expansion joints and cracks. The floor, which was bead-blasted in 1989, is stained with paint within the spray booths on the north side of the hangar, but paint staining is not significant in the open portion of the high bay. The utility pits contained sediment and do not appear to be significantly stained. No evidence of the former howdah was noted inside the hangar, although the roof vents are still present. The easternmost original downdraft exhaust pit contained several feet of liquid during the site inspection. According to Lockheed personnel, the liquid was pumped out in June 1991 and disposed off-site as a hazardous waste by a licensed hauler. The steel grate of the downdraft pit is coated with debris, and it is stained with paint and coatings. This downdraft pit is scheduled to be abandoned at the time of building demolition. The downdraft pits that were installed in 1970 were dry and clean inside. The steel grates were clean.

The four northern spray booths have minor amounts of paint overspray on the concrete floor within the booths. The abovegrade concrete reservoirs for each spray booth's filter system were dry. The southern spray booths have no significant

overspray staining. The paint spray robot was being dismantled at the time of the site inspection. The machinery is stained with coating, but the floor beneath it is not significantly stained with paint or coating. The area along the robot track is not significantly stained with paint or coating, although small oil stains were noted at the footings along the track, after removal of the robot. There is no evidence of the former dope fabrication room in the southeast corner of the hangar, and the floor in that vicinity is clean.

The concrete floor of the bermed hazardous materials storage area in the northeast corner of Building 83 is in good condition, with no joints or cracks. There are minor oil and paint stains and ring stains on the floor. The floor and wall in the vicinity of the former 20-gallon mixer has minor black-colored stains.

The floor of the paint mix/paint storage room has black stains on both sides of the partition. The stains appear to originate at the paint mix booth and appear to be coating material. The lab sink on the east wall of the room also appears to be stained black with coating material.

The pipe trench, floor drain, lockers and office cubicle are no longer present in the break room that was formerly the boiler room. No evidence of the boilers or the pipe trench was observed in the room. The current tile floor of the break room is clean. The enclosed northern portion of the former boiler room, which contains the heat exchanger, air supply fan, hot water pipe pit, steam condensate pump, and hot water circulating pump, has a bare concrete floor with what appears to be water staining. The sump and sand trap, which contained water at the time of the site inspection, could not be inspected for cracks. A small room south of the break room, which was also part of the former boiler room, contains a metal spiral staircase to the second and third floors, the concrete stack for the former boilers, and electrical equipment, primarily switch panels for paint booths and ventilation fans. There are no significant stains on the concrete floor, and the electrical panels appear to be in good condition.

The compressors in the southern portion of the east wing have oil and dry sweep material on the concrete pads directly beneath them. The bottom of the sump pit between the compressors is wet and oil-stained. The condition of the concrete in the pit could not be inspected due to the pipes in the pit and the pit's depth. The concrete floor of the pit beneath the air pressure tanks in the northwest corner of the compressor room has an oily stain and contains debris.

The electrical equipment in the transformer room on the second floor of Building 83 appears to be in good condition. The concrete floor of the room is cracked and there is a dark stain in the southeast corner of the floor. The central portion of the second floor is occupied by air filters, hot and cold plenums, and steam coils for the heating and ventilation system for Building 83. Fresh air louvers for the system are located on the east outside wall of the second floor. The concrete stack for the

former boilers and the circular metal staircase are located in the southern portion of this area of the second floor. No chemical use or storage has occurred in this portion of Building 83. The computer room was locked and was not inspected. The other rooms of the second floor had no stains or evidence of chemical use. Since the third floor fan room has no past or present chemical use, and since it was not accessible at the time of the site tour, it was not inspected.

4.2.4.2 Interior of Building 84

The concrete floor beneath the boilers is in good condition with no cracks or significant stains. The pipe trench is in good condition. There were some rust-colored ring stains on the concrete floor adjacent to the 55-gallon drums of water-treatment chemicals in the northeast corner of the building. Components of the water-treatment chemicals used by Chem Pro in Building 84 include cyclohexylamine, pentasodium triphosphate, sodium bisulfate, sodium hydroxide, sodium nitrite, and sulfamic acid. A table on the east wall has pumps and filters on it. A cabinet in the southeast corner of the building holds a few test instruments and water test chemicals. The chemicals in the cabinet include a Lamotte pH test kit and water test chemicals such as a hardness reagent and a conductivity standard reagent.

4.2.4.3 Exterior of Buildings 83 and 84

The asphalt of the storm drain flume south of Building 83 is in poor condition. There are wide cracks every three to five feet and a long crack down the center of the flume. There is an oily stain from the discharge of the compressor drain pipe that runs east to a chain-link gate across the flume. The south wall of Building 83 is stained with a rusty color below three fire sprinkler test lines that discharge to the storm drain flume. A 10-foot deep vault with concrete sides and floor and a wooden cover is located on the south side of the flume. The vault contains steam lines and valves and a condensate return tank. The concrete floor of the vault appears to be in good condition, but the vault was not entered for a detailed inspection.

The asphalt west of the hazardous material storage area west of Building 83 is stained with grey, blue, black, yellow, pink, red, and rust-colored stains that appear to be from leaking drums of paint and coating. A blue stain extends southward into the storm drain flume and then eastward along a crack in the asphalt near the center of the flume. The asphalt pavement within the chain link fence surrounding the hazardous materials storage area is in poor condition with many cracks and patches. It is stained with paint in the southeast corner, and a "No Smoking" designation is visible on the pavement. The concrete floor of the bermed hazardous material storage area is in good condition with no significant stains. The west half of the storage area contains seven grounded drums that contain chemicals, including Ardrex 1066K wipe solvent, IPA, MIBK, naphtha, and lacquer thinner. There are three flammable materials storage cabinets in this area. Products listed on the doors of the cabinets include fuel, lacquer, enamel, paint, solvents and reducers. The east half of

the hazardous materials storage area contains approximately 29 new drums that contain chemicals, including Ardrox fluorescent penetrant, 1066K wipe solvent, MIBK, and TCA. The sumps in the center of each half of the bermed hazardous material storage area and the grated trench on the north side of the area appear to be clean. The concrete pad at the northwest corner of Building 83 is stained a dark brown color. The pad consists of six sections separated by expansion joints. Some cracks in the concrete were also noted. The asphalt in the remainder of the yard west of Building 83 is in good condition with few cracks and no significant stains. The bulk storage area (Building 83A) is orderly and clean. Eleven rust-colored ring stains were noted along the southwest edge of the concrete floor of Building 83A. Items stored in the area formerly included shop supplies such as dry sweep and tape, but the shelves in the area were empty at the time of the site inspection.

The area along the north side of Building 83 is discussed from west to east. A battery charger for forklifts used inside the building is located near the northwestern corner of the building. The charger is covered by a small wooden shelter. The asphalt north of Building 83 is in fair condition, with many patches and cracks. There are localized paint stains and rust-colored ring stains near the northwest corner of the building. An approximately 10-foot long section of each of the newer downdraft exhaust tunnels is visible from an opening on the north side of Building 83. The concrete of these newer downdraft exhaust tunnels is dry and unstained. A compressed air pit is located in an area west of the new exhaust tunnel fans, where it was relocated in 1970 when the tunnels were constructed. The pit has approximately six inches of dark-stained soil over the crushed rock bottom. The floor sink at the west end of the concrete pad where the breathing air system is located contains oily liquid approximately four inches deep. A drain pipe located at the concrete pad which supports the newest breathing air system is oily. The exhaust fan for the easternmost original downdraft exhaust tunnel is still present on a second concrete pad east of the former breathing air system. The fan is connected to an exhaust duct that discharged above the roof of Building 83 but it has not operated in recent years. The exhaust fan has a metal catch pan beneath it that contains oil and dry sweep material. The concrete pad beneath the fan is discolored but there are no stains on the adjacent asphalt. A three-stage clarifier that receives discharge from the duplex sump pump for the new exhaust tunnels and a floor sink inside Building 83 is located north of the exhaust fan pad. The clarifier discharges to the sanitary sewer, which connects to the City of Burbank system at Hollywood Way. The liquid in the first (westernmost) compartment of the clarifier is clear with a slight oily sheen and a slight hydrocarbon odor. The concrete walls of the clarifier are not stained. The liquid in the second and third compartments is clear with no odor or sheen. The sides of the clarifier above the liquid level have no visible cracks, but the walls and floor could not be inspected in detail due to the presence of liquid in the clarifier compartments. The discharge pipe from the third stage of the clarifier is corroded. A fire alarm control cabinet located along the wall east of the exhaust duct contains ten automobile-type batteries on two wooden shelves. The wooden shelves of the fire alarm control cabinet are stained yellowish-white from

battery acid, but the floor of the cabinet is unstained. There is a 30-gallon electric hot water heater for the rest room in a shed next to the fire alarm control cabinet. The electric water heater appears new, and the cabinet is clean. The sandy gravel bottom of a nearby four-foot-deep compressed air pit is stained black. The concrete sides of the pit are in good condition. Blowdown for the air conditioning unit that is located on the roof of the rest room enters a drain between the water heater and fire alarm control cabinet. A Carrier split-system air conditioning unit is located on a concrete pad near the northeast corner of Building 83. The concrete pads beneath the air conditioning units at the northeast corner of Building 83 are clean. Three water pipe pits are located near the northeastern corner of Building 83. The city water pit northeast of the air conditioning units is slightly stained on the crushed rock bottom. The concrete sides are unstained and in good condition. No stains were noted in two other water valve pits. A guard shack that was built in the 1980s northeast of the northeast corner of the building is clean. No stains were noted on the nearby asphalt pavement.

The asphalt on the east side of Building 83 is in fair condition, with many patches and cracks. No stains were noted on the asphalt in this portion of the Building 83 yard. The concrete pad beneath the cooling tower and water mains at the southeastern corner of the building is clean and in good condition.

The asphalt pavement around Building 84 is in fair condition. A large patch is present where the 5,000-gallon tank was formerly located. The pavement is stained a whitish color beneath the discharge from the pipe trench at the southeastern corner of Building 84, and it is rust-colored from Building 84 to the storm drain flume. Water was noted discharging to the pavement at this location and running to the storm drain flume during the site inspection.

4.3 BUILDING 88

Building 88 is located near the north property boundary of Parcel 2, north of Building 354 and east of Kenwood Street, as shown on Figure 4-1. A plot plan of the interior and exterior of Building 88 is presented on Figure 4-7. Initial construction of Building 88 began in 1944 and included the main tunnel structure and the control room area. The building is currently used as a power plant and fuel systems laboratory.

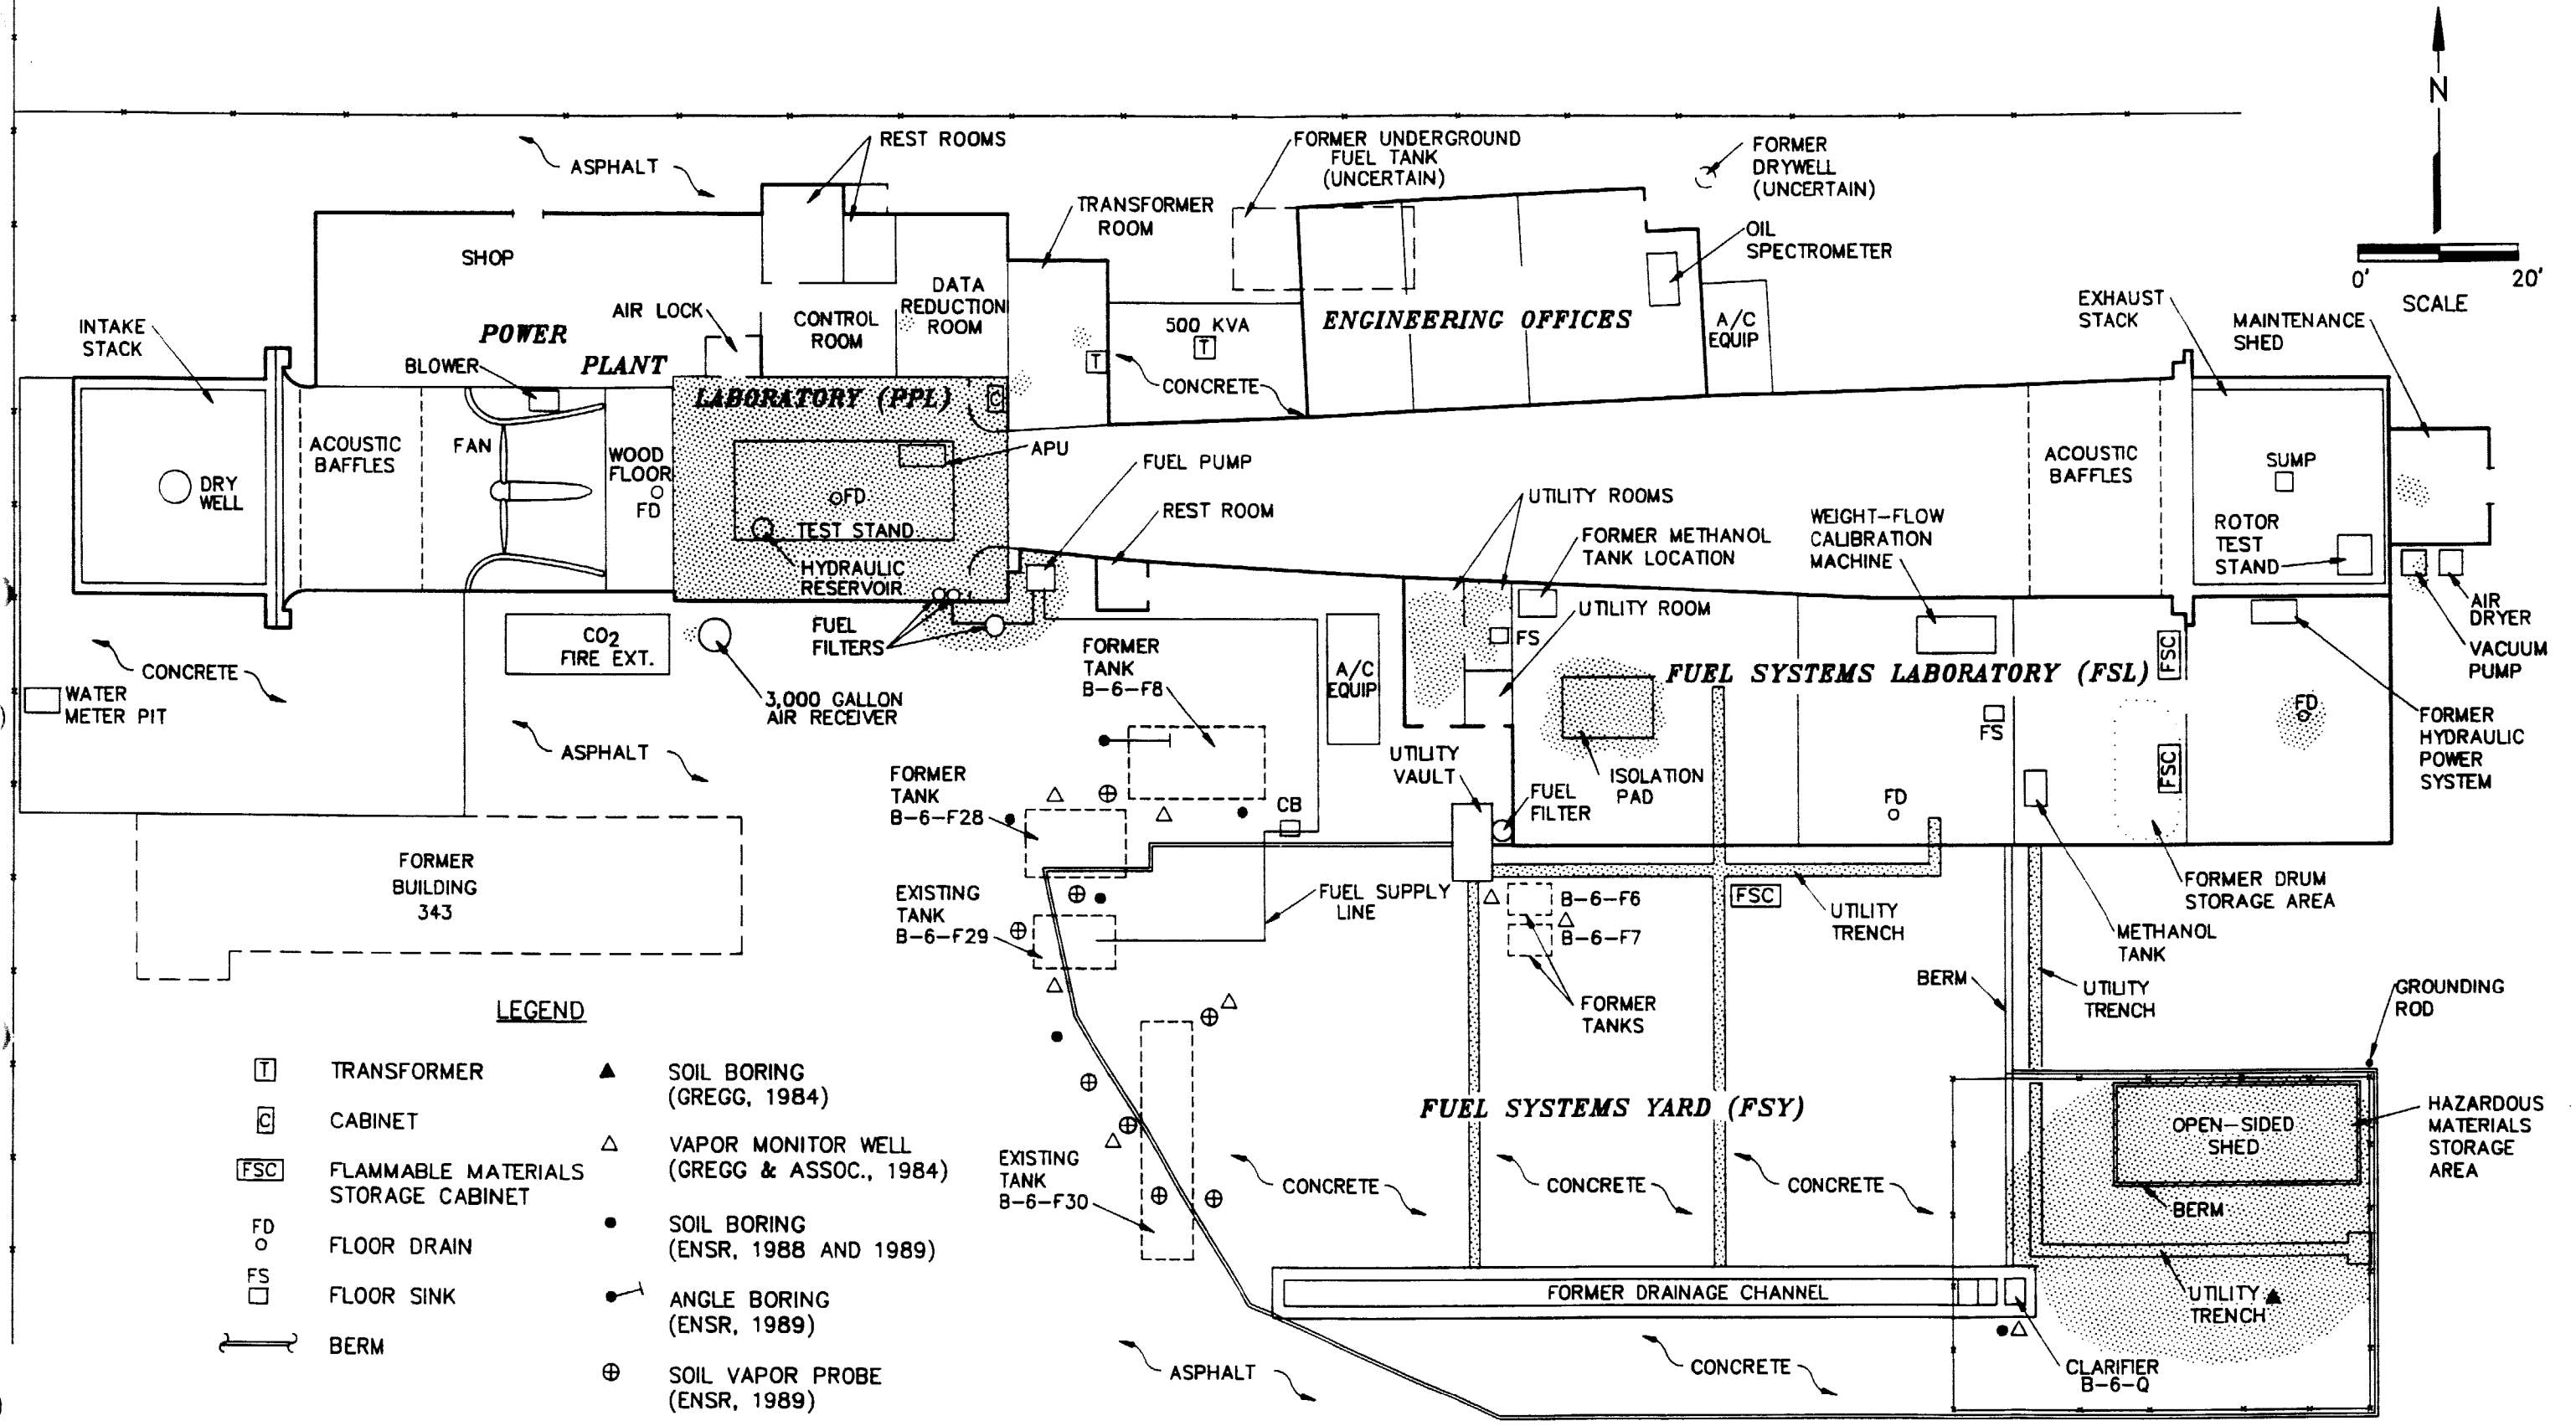

Information on the present and historical uses of Building 88 was compiled with the help of Mr. Henry Gill and Mr. Frank Stockemer, current and retired Lockheed employees, respectively. Discussions of the building construction details, previous operations and present use, previous investigations, and site inspection are presented below.

4.3.1 Construction Details

Building 88 is a 13,300-square-foot structure that was constructed in sections from 1944 to 1956. The building includes a power plant laboratory (PPL), fuel systems laboratory (FSL), engineering offices, and maintenance shed (see Figure 4-7). A fuel systems yard (FSY) area is associated with, and located south of, the FSL. The PPL was constructed in 1944 and consists of a wind tunnel and control room areas. The PPL tunnel is constructed of reinforced concrete and steel and has fluorescent and explosion-proof incandescent and quartz-halogen lights in the test section. The walls of the test section, the 40-foot segment of the tunnel containing the test stand, are covered with sound absorbing materials with perforated metal surfaces. The PPL shop and control room areas have concrete floors, wood frame walls and roof deck, and fluorescent and incandescent lights. The control room and data reduction room have 12-inch square floor tiles, acoustic ceiling panels, and gypsum board walls covered with a sound-absorbing material. The rest rooms have painted concrete and ceramic tile floors, acoustic panel ceilings, and painted gypsum board walls.

The FSL and FSY were constructed south of the PPL tunnel in 1946. The FSL has painted concrete floors, wood frame walls and roof deck, and fluorescent lights. One of the four main rooms of the FSL has nine steel rails recessed in the concrete floor that were used as mounts for test apparatus. The FSY has a large open, bermed concrete area constructed to slope toward a drainage channel that discharged to a clarifier, identified as B-6-Q. The former concrete drainage channel was 4-foot wide, 5-foot deep, and approximately 100-foot long and received fluids from floor drains in the PPL and FSL, and a catch basin in the FSY, in addition to surface runoff. The drainage channel was filled with concrete in the 1980s. The FSY has a network of concrete utility trenches and vaults that contain electrical, hydraulic, fuel, and

compressed air lines and connections. The trenches receive surface runoff that also was previously discharged to the drainage channel and clarifier. When the drainage was filled with concrete in the mid-1980s, the utility trenches no longer had drainage outlets. Six underground fuel tanks have been installed in the FSY to support FSL and PPL operations. The tanks have contained fuel oil, aviation grade gasoline, and jet fuel.

An engineering office was added on to the north wall of the PPL tunnel in 1952. The office has a concrete floor covered with 12-inch square tiles, wood frame walls and roof deck, acoustic ceiling panels, and fluorescent lights. A 1952 engineering drawing references a 3-foot deep, 18-inch diameter dry well filled with broken rock located near the northeast corner of the engineering office, as shown in Figure 4-7. The dry well was to receive water from an evaporative cooler located on an interior wall of the engineering office. The PPL tunnel was modified in 1953 when intake and exhaust stacks were added to the west and east ends, respectively. The stack walls are constructed of reinforced concrete and are open at the top. The exhaust stack has incandescent lights mounted on the walls. Each stack has a centrally-located floor grate to receive precipitation. A 16-foot deep dry well is located below the floor grate of the intake stack. The well walls are constructed of perforated concrete blocks and the base of the well is composed of two feet of crushed rock. A one-foot deep sump that discharges to clarifier B-6-Q is located beneath the floor grate in the exhaust stack. Acoustic baffles are located in the intake and exhaust tunnel adjacent to the stacks. The baffles consist of floor to ceiling vertical vanes approximately 16 feet long that have perforated sheet metal outer skins over metal screen and sound absorbing material.

A metal maintenance shed on a concrete slab was added to the east end of the PPL tunnel in 1956. The shed has fluorescent lights. A hazardous material storage area was established in the late 1980s in the southeastern portion of the FSY. An open-sided shed covering a 30- by 10-foot concrete pad with a six-inch high concrete berm was constructed in the existing FSY. The concrete pad and berm were sealed to reduce permeability. The shed and a portion of the FSY are enclosed by a chain link fence that delineates the hazardous material storage area. Building 88 is serviced by underground utilities including water, sanitary sewer, electricity, telephone, natural gas, and compressed air.

4.3.2 Previous Operations and Present Use

The Building 88 site was an undeveloped field when Lockheed began operations at Plant B-6 in 1941. No known Lockheed buildings or activities were located at the site until the construction of Building 88. Building 88 has operated continuously as

a power plant laboratory since its construction and has been used mainly to test engine performance, although engine-aircraft interface testing, fuel and oil systems testing, and other component testing has occurred in the building. Both reciprocating and turbine engines have been tested in the PPL, and these required 130 to 145 octane aviation gas and various grades of jet fuel.

Fuels, solvents, and other hazardous materials used at Building 88 are stored in two flammable materials storage cabinets located in the FSL, a flammable materials storage cabinet in the FSY just south of the FSL, and in a hazardous materials storage area south of Building 88, adjacent to the east side of the FSY. Drums and smaller containers of hazardous materials for use in Building 88, as well as other buildings in the northern part of Plant B-6, are stored in this area. Fuel is also stored in underground tanks located south of the building. The use of these materials is described below.

Six underground tanks have been installed in the FSY area, south of Building 88, as shown and identified in Figure 4-7. Lockheed employees stated that the evolution of testing operations at Building 88 required increasingly larger fuel tanks as well as tanks for different fuels. A 1944 design drawing references an additional 5,000-gallon underground fuel tank located north of Building 88, however, later design drawings do not note the presence of this tank and Lockheed employees do not recall a tank in this location. A 1946 engineering drawing indicates that tanks B-6-F6, B-6-F7, and B-6-F8 were already present in the FSY; the date of installation of these tanks is unknown. Tanks B-6-F6 and B-6-F7 were each 550-gallon jet fuel tanks that were removed in 1989. Both of these tanks may have initially contained fuel oil. Facility drawings show tank B-6-F8 as a 5,000-gallon jet fuel tank. The tank was abandoned (filled) in place in 1989. This tank may have initially contained aviation gasoline. Tanks B-6-F28 and B-6-F29 were referenced as existing in 1969, and were 8,500- and 5,000-gallon jet fuel tanks, respectively. Tank B-6-F28 was removed in 1989, but B-6-F29 is still in service and contains Jet A fuel. Tank B-6-F30 is a 15,000-gallon Jet A fuel tank that was installed in 1969 and is currently used to supply tank B-6-F29 on an as-needed basis. Fuel is manually transferred from tank B-6-F30 to tank B-6-F29 using hoses and a portable, electrically powered fuel pump.

A fuel pump and fuel filter are located at the outside southeast corner of the test stand section of the PPL. Two additional fuel filters that are plumbed into this system are located against the southern wall of the test stand section, as shown on Figure 4-7. This pump has always been used to supply fuel from the underground tanks to the test specimens in the PPL. The fuel supply and return lines from tank B-6-F29 to the fuel pump are located above ground on the asphalt and concrete surfaces between the fuel pump and the underground tank. Lockheed employees stated that the tanks have always been filled from tanker trucks. An additional fuel filter is located adjacent to the utility vault in the FSY. This filter is plumbed into lines between the utility vault and the FSL.

Lockheed employees could recall two or three fuel spills at Building 88, including an overflow of tank B-6-F28 and one spill in the test section of the PPL as a result of an engine explosion. The fuel spills were approximately 50-gallons each. Fuel spilled in the fuel test yard was washed with water into the utility trenches which discharged into the drainage channel and clarifier B-6-Q. Floating fuel was removed from the drainage channel and clarifier by a pumping company or was left to evaporate. Facility drawings show discharge from the clarifier flowed to a remote sump located approximately 75 feet southeast of the clarifier where a pump, activated by a float in the clarifier, discharged the water to the sanitary sewer. The float was designed to detect the fuel-water interface allowing only water to be pumped from the clarifier.

Engine and component testing occurs in the test section of the PPL. The test stand is used to mount the engine, or specimen, to be tested. Electrical power is supplied to the test specimen from an auxiliary power unit (APU) powered by a turbine engine fueled from tank B-6-F29. An APU has been present since approximately the mid-1950s. The APU is used in the majority of applications in the test section, mainly to supply electrical power for starting turbine engine test specimens. An air-start system was installed in the test section in the mid-1950s for starting turbine engine test specimens. It turns the test engine turbine while electrical power is supplied by the APU. The system included a 3,000-gallon air receiver located south of the test section that was connected by pneumatic piping to the engine test stand. The air receiver is supplied by the Plant B-6 compressed air system. A large fan that is located just west of the test stand provided wind through the test section to simulate flight conditions during testing of reciprocating propeller engines. The fan is not used during turbine engine testing except to vent heat from the tunnel after a testing episode. Lockheed personnel indicated the fan has been used approximately 20 times in the last 10 years.

The eastern portion of the tunnel is used to vent engine exhaust to the exhaust stack. A gas detection system was installed in the tunnel in the mid-1950s for use during gasoline powered engine tests. The system consisted of gas collectors, analyzers, and instrumentation to analyze engine exhaust for evaluation of engine performance. The gas detection system has not been used for at least ten years.

A water injection system was installed in the test section of the tunnel in the mid-1950s. The system consisted of a ring of water injection nozzles directed into the exhaust stream that cooled the hot gases and prevented physical damage to the tunnel during tests on engines with afterburners. The water was almost entirely expelled as steam or vapor, although a small amount may have condensed in the exhaust stack and collected in the floor sump. The water injection system was removed prior to 1980.

Engine testing is controlled remotely from the control room located north of the test section. Data are collected and analyzed by computers in the data reduction room. The PPL shop, located west of the control room, is used to fabricate and assemble test parts, fixtures, and instruments used in engine testing. Instrumentation used in power plant and fuel systems tests is calibrated on a weight-flow calibration machine located in the FSL. Household grade cleaners and ammonia have been used to clean glass, table, and control console surfaces in the PPL and FSL.

Samples of engine oil from test specimens, or from operations at other Lockheed plants, are analyzed for metals contamination with an oil spectrometer in the engineering office. Samples of engine oil are received in glass vials and approximately one ounce of sample in a small cup is placed in the sample port of the spectrometer. The sample is partially vaporized by an electric arc and analyzed for metals. The sample cups and vials are placed in a metal pan and cleaned with trichlorotrifluoroethane (Arklone-P), a Freon-type solvent. Remaining sample fluid and waste Freon are deposited in waste oil and solvent receptacles in the flammable materials storage cabinet in the FSY just south of the FSL. Fresh Freon is stored in a one-gallon container in one of the two flammable materials storage cabinets located in the FSL.

Fuel systems were tested in conditions simulating flight in the FSL and FSY. For the most part, these tests occurred prior to 1980. Typically, test apparatus was located in the FSY and was controlled from the FSL. Prior to 1980, test specimen parts and test apparatus were typically cleaned with various solvents and were sometimes painted in the FSL and FSY. A portable toluene cart was used in various areas of the FSL and FSY to clean specimen or apparatus parts. Spent toluene was pumped into drums, stored in the fuel lab until full, and transported to the salvage and reclamation yard at Plant B-1 in the past and to the SAC since 1990.

Fuel delivery systems were tested for performance in various pressure and temperature conditions. Fuels for tests were supplied from the underground tanks or portable fuel carts. Vacuum pumps located at the east end of the PPL provided low-pressure environments for high altitude simulations. Fuels were cooled and heated through stationary or portable closed system heat exchangers using methanol, ethylene glycol, or water and steam or hot water as agents of heat transfer. Methanol or ethylene glycol was pumped from approximately 50-gallon above-ground tanks located in the FSL. A 1957 design drawing indicated that a methanol tank was located in the northwest corner of the fuel laboratory as shown on Figure 4-7. Currently, the methanol tank is located near the southern wall in the eastern part of the FSL. Cooling and heating fluids were distributed to heat exchangers through overhead piping and hoses. Steam or hot water was generated by equipment located in the maintenance shed at the east end of Building 88. Fuel, solvent, and engine oil were previously stored in 55-gallon drums in the eastern portion of the FSL, as shown on Figure 4-7. The fuel or oil was pumped directly into small scale test

specimens. Fuel from underground tanks used in large scale tests in the FSY was returned via piping to the same fuel tanks; in general, no waste fuel was produced. Any waste fuel that was produced was drummed for disposal.

A hydraulic drive, variable speed power system was installed in the FSL adjacent to the exhaust stack in the mid-1950s. The former location of the hydraulic power system is shown on Figure 4-7. This system supplied power to hydraulically driven fuel or oil pumps and to a rotor test stand in the exhaust stack. Hydraulic lines from the power system were routed overhead in the FSL, into utility trenches in the FSY area and through the wall into the exhaust stack. Lockheed employees stated that the hydraulic system was very reliable and only a few, minor spills (less than one gallon) occurred while disconnecting lines. Absorbent dry sweep was used to soak up spilled hydraulic fluid.

Additional equipment was installed in the FSY area in 1969 and included two fueling stations located in the southern portion of the yard, fuel distribution piping, and fuel separators mounted on a concrete pad just east of tank B-6-F29. The additional equipment increased capabilities for testing of L-1011 fuel systems. A new utility trench to convey hydraulic and compressed air lines was installed south of the FSL through the eastern portion of the FSY. Portable hydraulic gigs were operated at the terminal end of the trench.

The maintenance shed and an oil-fired steam boiler were installed at the east end of the PPL tunnel in 1956. Fuel oil was supplied to the boiler through underground piping from a 2,500-gallon underground tank located adjacent to Building 347, approximately 60 feet to the east; the location of the underground tank is shown on Figure 4-22, in the section on Building 347. The steam boiler was replaced with a natural gas-fired water heater in 1969. Natural gas was supplied to the heater through underground piping from the Building 347 area. The fuel oil supply and return lines, and the underground tank were deactivated in accordance with the Burbank Fire Department abandonment procedures, dated April 14, 1965. This tank is further described in the Building 347 section of this report. Water heater equipment was removed from the shed prior to 1980 and the shed was converted to a maintenance storage area.

Chemicals are not stored or used in large quantities at Building 88 with the exception of fuel stored in underground tanks. Small amounts of solvents including MEK, MIBK, TCA, IPA, acetone, and Stoddard solvent have been used in the PPL and FSL for cleaning parts used in test set-ups or for test preparation. The solvents are typically contained in small applicator bottles at individual work stations, applied to the part and wiped clean with a rag. Soiled rags were transferred to oily rag receptacles. Other chemicals such as lubricating oils and greases, spray lubricants, Freon, sealing compounds, and paint have been used in small quantities. Fifty-five-gallon drums of fuel, oil, grease, and solvent were stored in the fuel laboratory until 1987 or 1988 at the location shown on Figure 4-7. These chemicals are currently

stored in the hazardous material storage area south of Building 88 and in cabinets south of Building 349. The storage area at Building 349 is discussed further in the Building 349 section of this report.

4.3.3 Previous Investigations

Previous investigations at Building 88 include 1984 and 1989 underground tank investigations conducted by Gregg and Associates, and ENSR, respectively. Six underground storage tanks, B-6-F6, B-6-F7, B-6-F8, B-6-F28, B-6-F29, B-6-F30, and one clarifier, B-6-Q are or were located south of Building 88. A brief discussion of the investigation at each tank and clarifier is presented below.

Tanks B-6-F6 and B-6-F7 were both 550-gallon underground jet fuel tanks located outside the southern exterior of Building 88 (see Figure 4-7). Gregg and Associates investigated these tanks in 1984 during the leak detection program. A soil sample was collected at a depth of 8 feet from each of two soil borings that were drilled to a depth of nine-feet adjacent to each of the two tanks. Both soil borings were completed as vapor monitoring wells. The soil samples were composited and the composite soil sample contained 20.8 mg/kg TPH. Gregg and Associates attributed this concentration to surface spills or other sources. In 1989, ENSR removed both tanks. Sampled soil from the excavation bottom did not show detectable concentrations of jet fuel (detection limit of 10 mg/kg).

Tanks B-6-F8 and B-6-F28 were both underground jet fuel tanks located at the southern exterior of Building 88. Gregg and Associates reported a capacity of 15,000 gallons for B-6-F8, facility drawings show the tank as 5,000 gallons, while ENSR reported the tank to be approximately 8,000 gallons. Tank B-6-F28 had a capacity of 8,500 gallons. Gregg and Associates drilled two soil borings between the two tanks in 1984 to total depths of 15 feet and 20 feet. Both borings were completed as vapor monitoring wells. Soil samples were taken at depths of 14 feet in one boring and 19 feet in the other boring. The 14-foot deep sample contained 15.6 mg/kg TPH and the 19-foot deep sample had no detectable hydrocarbons (the detection limit was not reported). Gregg and Associates attribute the low TPH concentration in the 14-foot deep sample to surface spills or spillage in the fill box. In 1988, ENSR drilled one soil boring to a depth of 40 feet to address both tank B-6-F8 and tank B-6-F28. Samples were collected at depths of 15 feet and 40 feet for TPH analysis. The laboratory analysis of the soil samples indicated no detectable levels of hydrocarbons (10 mg/kg detection limit).

In 1989, ENSR drilled two more soil borings around tank B-6-F8 to total depths of 20 and 40 feet. The 40-foot deep boring was drilled at a 15° angle from vertical enabling ENSR to test soil directly beneath tank B-6-F8. All samples showed no detectable TPH (detection limits of 5 mg/kg TPH for the 40-foot deep boring and 10 mg/kg TPH for the 20-foot deep boring). ENSR also placed two shallow soil vapor probes adjacent to tank B-6-F28 and detected trace to background levels of

hydrocarbons in soil gas samples obtained from the probes. ENSR concluded that the tank had not leaked and that adjacent soil had not been impacted. Tank B-6-F8 was abandoned in place in May 1989. Tank B-6-F28 was removed in August 1989. Grab samples were collected at opposite ends of the tank B-6-F28 excavation. Although no TPH was detected in the two collected soil samples (10 mg/kg detection limit), a hydrocarbon stained area was observed in the central portion of the tank excavation. This area was not sampled. Field observations by ENSR indicated the jet fuel appeared to have leaked during past operations, possibly impacting soils.

Tanks B-6-F29 and B-6-F30 contain jet fuel and are still in service. These tanks have capacities of 5,000 gallons and 15,000 gallons, respectively. Gregg and Associates drilled three soil borings that were completed as vapor monitoring wells adjacent to these two tanks in 1984. Soil samples were taken at a depth of 18 feet from each of the three borings. Laboratory analysis revealed no detectable hydrocarbons in the three samples (detection limits were not reported). In 1988, ENSR drilled one 40-foot deep soil boring to address tanks B-6-F29 and B-6-F30. Soil samples collected at depths of 20 and 40 feet had no detectable hydrocarbons. Soil gas samples obtained from vapor probes located at these tanks contained trace to background levels of hydrocarbons. No further investigation was recommended. In December 1988, Tank Testing International, Inc. certified tanks B-6-F29 and B-6-F30 as tight. ENSR drilled one more soil boring just north of B-6-F29 to a total depth of 56 feet on July 19, 1989. Soil samples were collected at depths of 10, 17, 20, 30, 40, 50 and 55 feet, and the 17-, 40-, and 50-foot deep samples were analyzed for TPH and BTXE. TPH was detected at 4,370 mg/kg at 17 feet and 796 mg/kg at 40 feet; benzene was detected at 2 mg/kg at 17 feet; toluene was detected at 16 mg/kg at 17 feet; ethylbenzene was detected at 21 mg/kg at 17 feet and 1 mg/kg at 40 feet; and xylenes were detected at 108 mg/kg at 17 feet and 2 mg/kg at 40 feet. No chemicals were detected at 50 feet. Detection limits were 10 mg/kg for TPH, 0.5 mg/kg for benzene and toluene, and 0.1 mg/kg for ethylbenzene and xylenes.

ENSR concluded that tank B-6-F29 may have leaked at some time after the December 1988 tank integrity test, or positive soil contamination results from the July 19, 1989 boring could be due to a release from tank B-6-F28, where staining was observed in the excavation pit. In July 1990, ENSR reported that tanks B-6-F29 and B-6-F30 tested tight. Tank level monitoring systems and overspill protection boxes were installed on those tanks at that time.

Clarifier B-6-Q is a concrete two stage unit located approximately 50 feet south of Building 88. The clarifier previously collected storm water and fluids from the FSY and from floor drains in the FSL and PPL. Although the depth of the clarifier is unknown, the surface measurements are 4.5 feet in width by 5.5 feet in length. Gregg and Associates drilled one 40-foot deep soil boring adjacent to the clarifier in 1984. After soil samples were collected at depths of 3, 5, 10, 15, 23, 32 and 40 feet, the soil boring was completed as a 20-foot deep vapor monitoring well. Laboratory analysis of the soil samples detected benzene at 37.3 $\mu\text{g}/\text{kg}$ at 5 feet, decreasing to

9.8 $\mu\text{g}/\text{kg}$ at 40 feet; toluene at 48.5 $\mu\text{g}/\text{kg}$ at 5 feet, decreasing to 32 $\mu\text{g}/\text{kg}$ at 40 feet; and 1,1-dichloroethene, TCE, TCA, and PCE at the 5-foot depth at concentrations of 16.5, 37.0, 24.0, and 34.3 $\mu\text{g}/\text{kg}$, respectively. No TPH was detected in the boring (detection limits were not reported). A liquid sample collected from the clarifier contained 0.1 mg/kg IPA, 0.6 mg/kg MEK, and 4,400 mg/kg TPH.

Gregg and Associates concluded that the clarifier was leaking, and additional sampling was recommended. In December 1984, Gregg and Associates drilled two 80-foot deep soil borings at B-6-Q. The only chemicals detected were TPH, with a maximum concentration of 26.8 $\mu\text{g}/\text{kg}$ occurring at a depth of 30 feet. On May 24, 1985, the contents of B-6-Q (waste oil sludge) were pumped out. The concrete of the clarifier showed signs of deterioration near the top of the walls and on the bottom of the clarifier; Gregg and Associates recommended abandonment. ENSR drilled one 20-foot deep soil boring adjacent to B-6-Q in 1988. Samples were analyzed for VOCs by EPA Method 8240 at the 10-foot and 20-foot depths. All volatile compounds were below the detection limit of 5 $\mu\text{g}/\text{kg}$. No further investigation was recommended. ENSR declared the clarifier exempt from underground storage tank compliance in May 1990. Although a 100-foot long trench leading into the clarifier has been filled in, the clarifier is still in use and currently receives storm run-off and spilled fluids from the FSY. It is not known whether the clarifier received any repairs for the deteriorated concrete that was noted.

4.3.4 Site Inspection

The discussion of the site inspection incorporates the interior areas of Building 88 and the associated exterior areas. The exterior areas include underground tanks, utility trenches and the clarifier in the FSY area that are related to operations in Building 88.

4.3.4.1 Power Plant Laboratory (PPL)

Most of the painted concrete and metal interior surfaces of the PPL tunnel are relatively clean; no significant stains are evident on the fan housing or the tunnel surfaces. The concrete floor under and around the test stand is lightly to moderately stained from fuel, oil, and hydraulic fluid. A fuel filter is located in the southeast corner of the test section; moderate staining was noted on the floor in the area of the fuel filter. A former floor drain under the test stand has been filled with concrete. The drain was plumbed to the drainage channel in the FSY and formerly received fuel, oil, and hydraulic fluid that spilled in the test section.

The inside walls and floors of the intake stack are clean. The dry well in the center of the intake stack floor appeared clean, although the gravel layer base of the dry well could not be observed due to the presence of accumulated dust and dirt. Lockheed employees stated that the well received only rain water through the intake

stack opening, and no testing or chemical use occurred in the intake stack. The inside walls and floor of the exhaust stack appeared to be discolored in comparison to the surfaces of the intake stack, although no distinct staining was noted. The floor sump in the center of the exhaust stack floor was empty and relatively clean. A portable steel frame stand is located in the southeast corner of the exhaust stack. A hydraulic drive motor and reduction gearbox is mounted at the top of the stand and was previously used for testing the rotor assembly for the AH-56 helicopter. A connection providing hydraulic power was located on the inside south wall of the exhaust stack to drive the helicopter rotor test stand motor. Hydraulic power was supplied by the hydraulic power system located in the easternmost portion of the FSL.

A raised wooden floor is present in the western portion of the test section between the test stand and the fan housing; the level of the concrete beneath this floor drops approximately 2 feet from the test section to the fan housing location. A floor drain in the lower concrete floor was plumbed to the drainage channel and was filled with concrete in the 1980s. The fan is driven by an electric motor in the fan nacelle. Other than checking the gear oil level and adding oil if necessary before operating the fan, no maintenance has been required. The fan motor is air-cooled by a blower system mounted on the side of the fan housing that circulates air through the housing, nacelle, and vanes.

A steel frame test stand in the test section held a turbine engine and a hydraulic pump at the time of the site inspection. Tubes running from the bottom of the engine carry fuel and oil from the engine to an approximately 10-gallon stainless steel rectangular tank mounted in the stand under the engine. The waste fluids are drained as needed into buckets and transferred to a waste oil container in the flammable materials storage cabinet in the FSY. A hydraulic system including an approximately 10-gallon reservoir is also mounted in the test stand to provide hydraulic loads to operating test engines. A compressed gas cylinder containing nitrogen is secured in the test stand and is used to pressurize the hydraulic system.

Two storage spaces are formed by the bell-shaped surface of the exhaust tunnel entrance. These storage spaces are used for storage of test apparatus and a cabinet that contained the following items:

- two 5-gallon cans of 3100 jet engine fuel path cleaner;
- three cases of 23699 jet turbo shaft lube;
- six quarts of 2389 synthetic oil;
- two quarts of 0-148 LGT lube oil; and
- one quart of Rotella fan gear oil.

A 5-gallon can of hydraulic fluid was also noted on the floor in the north storage area. The floor surfaces in both storage areas were moderately stained.

The PPL shop and control room area consists of four main rooms: a shop, a control room, a data reduction room, and a transformer room. An air lock connects the shop area to the test section of the tunnel and is incorporated into the structure of the tunnel. The air lock allows entry into the test section during engine testing. A wooden box and a plastic can in the air lock contained clean rags and soiled rags, respectively. The soiled rags were generated in the test section and the shop.

The concrete floor of the shop area has a few minor cracks, but no stains were noted. Machines present in the shop at the time of the site inspection included a drill press, grinder, a band saw, and a belt sander, that are all electrically powered and do not incorporate fluid reservoirs. Other items in the shop area include work benches, tool cabinets, tables and desks. No flammable storage cabinets or chemical storage were noted at the time of the site inspection.

The control room contains file cabinets and electronic equipment, and controls and instrumentation for the testing of engines. No significant stains were noted on the tile floor. The rest rooms located adjacent to the control room are relatively clean. The data reduction room contains computers and other electronic equipment, file cabinets, and a small, cart-mounted, portable hydraulic power system. The specific use of this hydraulic power system is unknown. An oil-absorbing pad was present under the hydraulic cart to catch small amounts of dripping hydraulic fluid; the surrounding floor is lightly stained. A wall-mounted air conditioner is located in the north wall of the data reduction room. The transformer room contains an air-cooled transformer, generator, switchgear, motor starter, and circuit breaker panels. The floor in the room is relatively clean except for two small oily stains.

4.3.4.2 Engineering Office

The engineering offices contain desks, drafting tables, file cabinets, and an oil spectrometer. The tile floors in the engineering offices are relatively clean. Extensive repositioning of the interior walls in the engineering office space has occurred based on comparison of a 1952 engineering drawing and the current floor plan. Walls have been removed resulting in fewer, but larger rooms. No evidence of the evaporative cooler or the dry well that were shown on an early drawing were noted during the site inspection, and Lockheed interviewees did not recall their existence.

4.3.4.3 Fuel Systems Laboratory (FSL)

The FSL is divided into four main rooms that are accessible from the FSY area through a set of large doors. Three small utility rooms are located at the west end of the FSL. Concrete-lined utility trenches in the FSY extend into the FSL at two

locations. The sides and bottoms of the concrete trenches in the FSL are typically covered with an oily, dusty residue. The concrete floors of the FSL are in good condition and are relatively clean. Two floor drains and a floor sink are located in the FSL. Lockheed employees stated that the floor drain in the easternmost laboratory room was filled with cement in the 1980s; the concrete floor around the drain is rust-stained and flaking away. The floor drain and floor sink in the west-central room of the FSL are clear and relatively clean.

Equipment stored in the FSL includes two empty fuel carts, a fuel heater, a weight-flow calibration machine and data cart, a vacuum tank, a compressed air receiver, a methanol tank, pump, and heat exchanger, an empty toluene cart, a water heat exchanger, and several tool cabinets that contained tools and test apparatus. Lockheed employees stated that very little component testing has been conducted in the FSL recently; the majority of use occurred through the 1970s. The weight-flow calibration machine and heat exchangers have been used recently; a drip pan below the machine contained standing oil, although the surrounding floor was not significantly stained.

Two storage cabinets in the FSL contained paper supplies and a one-gallon can of Freon. Two flammable material storage cabinets in the FSL contained the following items at the time of the site inspection:

- 15 cans of spray paint;
- 1 quart window cleaner;
- 1 gallon acetone;
- 6 gallons MIBK;
- 5 gallons Freon;
- 1 gallon MEK;
- 1 gallon MEK/MIBK blend;
- 1 gallon ammonia;
- 1 gallon Turco 6646;
- 1 gallon IPA;
- 1 gallon trichlorotrifluoroethane (Arklone-P);
- 5 gallons JPTS Exxon stable jet fuel;

- 2 gallons Stoddard solvent; and
- 1 gallon Freon 113.

A concrete isolation pad in the westernmost room of the FSL is the former location of a vacuum pump noted in a 1958 design drawing. The concrete floor on and around the pad is moderately stained. Lockheed interviewees do not recall the vacuum pump or its use. Drums of jet fuel, engine oil, and solvent were formerly stored in the FSL in the location indicated on Figure 4-7. The floor in the former drum storage area has minor stains. Lockheed employees did not recall any significant spills in the drum storage area or in other FSL locations.

The concrete floor in the small utility rooms west of the FSL was lightly to heavily oil-stained at the time of site inspection. The rooms contained two generators, a power distribution cart, and two air-cooled transformers. The larger generator is mounted over a drip pan which contained standing oil. The floor sink and the surrounding concrete floor is moderately stained. The floor of the southeastern room was painted and was the former location of a rest room. An existing rest room located on the south wall of the PPL has a concrete and ceramic tile floor.

4.3.4.4 Maintenance Shed

The shed contains wooden shelves holding maintenance department materials, including bags of absorbent dry sweep, fluorescent and incandescent tubes and bulbs, air conditioning filters, fiberglass insulation, tools, and other miscellaneous items. No chemicals are stored in the shed. The concrete floor of the shed is moderately oil-stained.

4.3.4.5 Exterior Areas

The yard areas around Building 88 are paved with asphalt, except for the bermed area of the FSY and a portion of the yard west and south of the intake stack that are paved with concrete. The asphalt is in fair to poor condition. The narrow yard area north of the building to the fence is used as a driveway and parking area for Lockheed employees. No evidence of an underground tank or dry well, as discussed above, was noted in the yard areas proximal to the engineering office. Minor automobile staining was noted west of the PPL shop and east of the engineering offices. A small rest room accessible from the yard area north of the control room is relatively clean. A water heater is located in the entry way to the rest room. No environmental concerns were noted in the rest room.

An air-cooled, 500-kVA electrical transformer, a distribution switchboard, and a set of breaker panels are located between the control room and the engineering offices. The equipment is mounted on a concrete slab; no stains were noted in this area. Air conditioning and heat pump equipment are mounted on a concrete slab adjacent to the east wall of the engineering offices. No significant stains were noted on the slab.

Trench patches in the asphalt extend in three directions from the area of the maintenance shed. A vacuum pump and air dryer are mounted on two small concrete slabs adjacent to the south wall of the maintenance shed. The vacuum pump, concrete slab, and some of the surrounding asphalt are moderately oil-stained.

The concrete surface around the west and southwest sides of the building is relatively clean. Steel rails are recessed in the concrete south of the intake stack. A small oil-stained area is present on the asphalt under the blowdown drain pipe on the air start system air receiver.

A large carbon dioxide fire extinguisher is located south of the intake tunnel of the PPL. The fire extinguisher contains 7.5 tons of carbon dioxide. Lockheed employees stated that the fire extinguisher system has never been used.

The concrete and asphalt surfaces in the FSY area were relatively clean at the time of the site inspection. The locations of decommissioned tanks B-6-F6, B-6-F7, B-6-F8 and B-6-F28 are indicated by relatively new concrete surfaces. A portion of a curb formerly over tank B-6-F28 remains as part of the berm around the FSY. The utility trenches are covered with steel plates; the trench surfaces are typically covered with an oily, dusty residue. Approximately ten large crates containing aircraft engines were present in the FSY near the abandoned drainage channel. No stains were noted in the crate storage area.

Underground tanks B-6-F29 and B-6-F30 are currently in service and contain Jet A fuel. A vault over tank B-6-F30 contains fill port and vent plumbing, and a large electric pump mounted on the tank. The surfaces in the tank vault were moderately-stained. Fuel supply piping from tank B-6-F29 to the fuel pump at the outside southeast corner of the test section runs on the concrete and asphalt surfaces of the FSY. No evidence of leaks in the fuel line were observed. The surfaces around the fuel pump and fuel filter were moderately stained. A catch basin is located adjacent to the FSY berm west of the FSL; the fuel supply and return lines from tank B-6-F29 run directly over the catch basin. The catch basin receives surface runoff and discharges to clarifier B-6-Q and contains a moderate amount of dirt and debris. The remote sump, which facility drawings had indicated as receiving discharge from the clarifier, was not located during the site inspection.

A utility vault is located near the southwest corner of the FSL and contains fuel, hydraulic, and compressed air lines. The surfaces of the vault are covered with an oily, dusty residue. An abandoned fuel filter is located between the utility vault and

the FSL. The filter is plumbed through the utility vault from fuel tanks to the west and through the wall into the western portion of the FSL. The line was capped off in the FSL prior to 1980. Air conditioning equipment for the FSL is mounted on a concrete slab west of the FSL. No significant stains were noted around the air conditioning equipment.

A flammable material storage cabinet is located in the FSY near the south wall of the FSL. The following items were noted in the cabinet at the time of the site inspection:

- an aerosol can receptacle containing one can of spray paint;
- 5 gallons of waste engine oil/synthetic oil; and
- 5 gallons of waste Arklone and waste oil.

The hazardous material storage area contained approximately thirty 55-gallon drums at the time of the site inspection, as follows:

- 4 drums Cim Star Qual Star;
- 1 drum Unocal motor oil;
- 6 drums Way Oil HD 68;
- 4 drums Unocal hydraulic oil AW 68;
- 5 drums 120 lb lube systems green grease;
- 1 salvage drum; and
- 10 empty drums.

The chemicals stored in this area are used in various buildings in the northern portion of Plant B-6. The surface of the storage area was noted to have minor to moderate oily stains. Two portable, pneumatic wet vacuums are also located in the hazardous material storage area. The units were not connected to the plant compressed air system at the time of the site inspection. Clarifier B-6-Q was not closely inspected because of its location inside the locked hazardous material storage area. A grounding rod is located outside of the bermed area at the northeast corner of the hazardous material storage shed.

4.4 BUILDING 304 AND ADJACENT BUILDINGS

Building 304 is located in the southern portion of Plant B-6, Parcel 2, just north of the southern border of the Plant (see Figure 4-1). This building was constructed in 1942 as an aircraft final assembly facility, and it has also been used for ground support equipment assembly. Adjoining and nearby structures that are also discussed in this section include Buildings 304A (304 Annex), 305, 306, 308, 314, 325, and 399T. Buildings 304A and 314 were constructed at the same time as Building 304; Building 308 was constructed in 1944; Buildings 305 and 306 were built in the 1950s; Building 325 was built in 1964; and Building 399T was built in 1982.

Information on the historical and recent operations at Building 304 and associated buildings was obtained through interviews and site walks with the following current and former Lockheed personnel: Mr. John Davis, Mr. Bill Detmer, Mr. Chuck Deyoe, Mr. Hunter Echols, Mr. Mark Engles, Mr. Jesse Gonzales, Mr. Jack Greenlee, Mr. Dave House, Mr. Jim Jenson, Mr. Hans Kluewer, Mr. Robert Miland, Ms. Gayle Miller, Mr. Howard Piette, Mr. William Robinson, Mr. Jim Shepherd Sr., Mr. Jim Shepherd Jr., Mr. Bob Stover, and Mr. Al Weaver. The tenure of the employees covers operations at B-6 since the early 1940s.

The following discussion of Building 304 and associated buildings is divided into construction details, previous operations and present use, previous investigations, and site inspection. Details for each of the buildings are given below.

4.4.1 Construction Details

4.4.1.1 Building 304

Building 304 covers approximately 120,000 square-feet of space and is a steel and wood frame structure with corrugated metal siding and a concrete floor slab. The roof is of sawtooth design, with wood and metal covering. Steel rails imbedded in the floor extend through nearly the entire length of the building. Approximately 100 utility pits were constructed in the floor of the building to provide access to electrical and/or compressed air utilities. These utility pits are typically 1-foot by 2-feet by 1-foot deep, with concrete walls, native soil bottoms, and steel plate covers. Two major utility trench systems are present in the floor of the building: one extends through nearly the entire length of the building, south of the building centerline, and one extends along the north side of the eastern half of the building. The trenches have concrete sides and bottoms and steel plate covers. Figure 4-8 presents a plot plan of Building 304 and adjacent buildings and shows significant floor features within Building 304. Figure 4-9 shows use areas within Building 304. Sliding, hangar-type doors enclose the west and east ends of the building and a 200-foot section in the center of the south wall. Lighting for the building is provided by fluorescent light fixtures. The building has overhead gantry cranes that can operate

over the entire length and width of the building. An overhead exhaust duct was constructed between column lines J and T, just south of the building centerline, for use with a moving painting system.

An avionics systems test facility was built along the southern wall in the eastern portion of the building in 1973. This three room structure is of wood frame construction, with a raised floor for electronic cable routing in the central portion. Vinyl tiles cover the floor of the eastern two rooms and the western room has a painted concrete floor. Acoustical tiles cover the ceilings of these three rooms. A rest room facility, which is now inactive, was constructed on the outside of the building at columns V and W.

A production control office was constructed in the eastern end of Building 304 approximately two years ago. This 24-foot by 36-foot office is constructed of prefabricated wall panels and has vinyl floor tiles. The office structure has no roof; clear plastic sheeting is draped over the top of the office to protect equipment from dust.

A room that formerly housed a large air compressor abuts the south side of the building at columns X and Y. Some facility drawings denote this room as Building 314, while other drawings denote the electrical substation that is located just to the west of this room as Building 314. For the purpose of this report, the substation building is designated Building 314. Facility drawings indicate that the compressor room has a 6-foot thick concrete foundation on a 2-foot thick concrete footing. The foundation has a 2-foot deep clearance pit, or well, for the compressor flywheel. A compressed air storage tank is located in the compressor room and is currently fed by the plant-wide compressed air system. A cooling tower for the former compressor was present just east of the compressor room.

Facility drawings from 1942 and 1958 indicate that an emergency generator powered by a gasoline engine was located in the compressor room. The 1942 drawings show a 100-gallon underground gasoline tank for the generator located 20 feet east of column Y and 13 feet south of the southern wall of Building 304. A corrugated metal shed, which formerly housed a 750-kVA electrical substation, was constructed in 1973 on the east side of the former compressor room. The concrete footings for the former cooling tower were removed at that time.

A concrete-lined, grated trench extends along the outside of the western end of the building to prevent stormwater runoff from entering the building. A similar trench extends along the north side of Building 306. The Building 306 trench discharges into a sand trap, which may discharge either to a storm drain line to the north or to

a 5-foot deep sump that is located approximately 30 feet east of the northwestern corner of Building 304. A pump in this sump discharges water into the storm drain trench along the western side of Building 304. That trench drains to a storm drain line that runs immediately south of Building 304. Facility drawings also indicate that sanitary sewer, fire water, telephone, and electrical lines extend south of the building.

On the north side of Building 304, near columns T and W, two acoustical enclosures (hydro cabañas) were constructed in 1964 to house hydro-gigs. These structures have concrete floors with drains that discharged to a tank adjacent to each structure. These tanks, B-6-M and B-6-N, are discussed below in the Previous Investigations section.

4.4.1.2 Building 304 Annex

The Building 304 Annex (304A) adjoins Building 304 on the south side at the western end of the building (see Figure 4-9). This two-story office structure was built at the same time as Building 304 (1942) and has approximately 9,600 square feet of floor space. Building 304A is constructed of wood framing with stucco covered walls. The structure is divided into numerous offices and has two rest rooms at the eastern end of the second floor. The floor of Building 304A is covered with vinyl floor tiles and carpeting. The office ceilings are covered with pressboard and acoustical ceiling tiles. Lighting is provided by fluorescent fixtures. Building 304A has a built-up asphaltic-type roof covering with reflective coating. Approximately 20 feet south of Building 304A, there was an underground diesel fuel storage tank (B-6-F25) that apparently fueled a heater in the building. This tank is discussed below in the Previous Investigations section.

4.4.1.3 Building 305

Building 305 is a small brick building that adjoins Building 304 on the north side, just east of the building centerline (see Figure 4-9). The building was constructed in 1953 for flammable liquids storage and has approximately 600 square-feet of floor space. The building has a concrete floor with a concrete berm to contain any spilled liquids. The ceiling/roof of Building 305 is composed of reinforced concrete. Wire mesh gates enclose the front of the building. A few years ago the eastern half of the building was enclosed with wood frame walls and gypsum board covering.

4.4.1.4 Building 306

Building 306 adjoins Building 304 on the north side, near the western end (see Figure 4-9). The structure was built in 1953 as a covered lunch area and cafeteria. In approximately 1964, the structure was modified by enclosing most of the lunch area and adding interior walls. Building 306 is constructed with a steel frame, wood walls and ceiling, and a concrete floor. The building has been separated into several rooms by wood-frame walls. A 40-foot long section in the center of the building has

an open front with no exterior wall. The building covers approximately 7,000 square feet of floor space. A metal-roofed shed abuts the western end of Building 306. Along most of the north side of Building 306 and along the west side of the shed is a concrete-lined grated trench that prevents stormwater runoff from entering the building. This trench is described in the Building 304 Construction Details section, above.

4.4.1.5 Building 308

Building 308 is located approximately 10 feet south of Building 304 and approximately 20 feet east of the Building 304 Annex (see Figure 4-9). The building is composed of rest room facilities and a former photography portrait studio. The building was built in 1944 and covers approximately 2,300 square-feet of floor space. Building 308 is of wood-frame construction with stucco walls and concrete floors. The floor of the eastern room of the two-room studio is covered with vinyl floor tiles. The other rooms have bare concrete floors. The rest rooms have floor drains that discharge to the sanitary sewer. The western room of the photography studio has a floor drain that is a remnant of the room's previous use as a rest room.

4.4.1.6 Building 314

Building 314 is an open-topped brick structure that encloses the 1,000-kVA electrical substation for Building 304. The building is located immediately south of Building 304, between the former compressor room and the inactive rest room (see Figure 4-9). A concrete pad for the electrical equipment covers approximately half of the building's floor; the remainder of the floor is unpaved. At the southern end of the building, metal covers provide access to subsurface electrical ducts that terminate at the building. The ducts formerly extended to a substation that was located approximately 350 feet southwest of Building 304.

4.4.1.7 Building 325

Building 325 was built in 1964 as a cafeteria; the building now houses LADC security offices and a credit union automated teller annex. Building 325 is located immediately north of the eastern end of Building 304 (see Figure 4-9). The building is constructed of steel framing with metal siding and roof. The building's floor is concrete, covered with carpet and vinyl floor tiles. Acoustical ceiling tiles are used throughout the offices in the building. The building has approximately 8,000 square-feet of floor space. The credit union automated teller annex is located near the center of the building, at the northern wall. A 20-foot by 40-foot covered storage area abuts the western end of the building. An 8-foot by 12-foot rest room facility is located adjacent to the northwestern corner of the covered storage area. The rest room is constructed of steel framing with metal siding and roof.

4.4.1.8 Building 399T

Building 399T is portable trailer structure that houses a radio repair shop and a personnel office. Building 399T was built in 1982 and is located just north of Building 304 and east of Building 306 (see Figure 4-9). The building has approximately 2,200 square-feet of floor space that is composed of offices, repair areas and rest room facilities. The structure sits approximately three-feet above ground on jacks. A metal shed is attached to the northeast corner of the building. The floor of the shed is paved with asphalt, like the parking area around it.

4.4.2 Previous Operations and Present Use

4.4.2.1 Building 304

Building 304 has been principally used for the final assembly of aircraft, starting with the P-38 from 1942 to 1945, the Constellation from 1945 to 1958, the model 188 Electra from 1958 to 1961, the P-3 from 1960 to 1985, and the S-3A from 1973 to 1979. After the P-3 program was moved from Plant B-6 in 1985, Building 304 was used for ground support equipment manufacturing, stationary structures manufacturing, and other miscellaneous special project functions. The building has been recently evacuated.

The building's design allows aircraft or aircraft assemblies to enter and exit through either the end doors or through the south-side doors. Final assembly of P-38s, Constellations, Electras and P-3s incorporated essentially the same procedures and operations. Partially completed aircraft were brought in through the eastern doors of the building and proceeded west through different assembly stations, finally exiting through the western doors. Progressing from east to west, the primary assembly operations generally included the following: bolting the tail section (empennage) onto the fuselage; installing hydraulic lines, fuel lines and control cables; installing engines; testing hydraulic lines using a portable hydraulic power unit (a putt-putt or hydro-gig); installing equipment racks, instrument racks and interior trim (wall panels, seats, etc.); installing electronic equipment; and performing various check-out procedures and inspections on the assembled aircraft.

In support of the assembly operations, wood shops, trim shops, a paint spray booth, parts storage areas and sub-assembly work areas were located along the northern wall of Building 304. Facility drawings indicate that the paint booth, located near column P, was a water-wash type until 1968, when it was changed to a dry-filter type paint booth. A small sump located near the corner of the former paint booth apparently received wash water overflow from the paint booth. Also located along the northern wall, in the western end of the building, was an aircraft fuel tank sealing operation. The tank seal operations reportedly used buna-N or thiokol (synthetic rubber compounds) to seal joints of the wing tanks of Constellation aircraft. After

applying the sealant by hand, the wing tank was filled with MIBK and then Stoddard solvent from aboveground storage tanks to check for leaks. The solvents were drained back into the storage tanks after the test. Reportedly, spills of fluids occasionally occurred during these operations. It is unknown when this operation began; the tank seal operation was removed from Building 304 in approximately 1952. From approximately 1953 until 1958, an overhead, crane-mounted painting unit (called a "howdah") was used to paint the tops of Constellation and Electra fuselages. The howdah operated between columns J and T.

Compressed air is distributed throughout the building from the compressed air storage tank (receiver) in the former compressor room. The air tank currently is supplied by the plant-wide compressed air system and was formerly supplied by the air compressor in the compressor room. Facility drawings indicate that the original compressor in this room was replaced in 1958, and that the 2-foot deep flywheel well of the old compressor was filled with concrete at that time. The old compressor had a cooling tower that was located just east of the room. This cooling tower is not visible on aerial photographs from late 1957. Facility drawings from 1958 indicate that a new cooling tower was to be located on the roof of the room to service the new compressor. These drawings show that a floor sink was to be added to the southeast corner of the room to receive cooling tower drain water. The compressed air receiver tank and a compressor condensate trap drained through a 4-inch cast iron pipe to the sewer. The roof-mounted cooling tower is not visible on aerial photographs dated 1968. It is likely that the air compressor was removed at approximately this time.

When the S-3A final assembly operations were conducted in Building 304, from approximately 1973 to 1979, the S-3A and P-3 assembly lines operated concurrently. The P-3 assembly stations described above were compressed to the western half of the building and the S-3A assembly and check-out stations occupied the eastern half. The S-3A aircraft entered through the southern doors, proceeded east along the northern wall, and exited through the eastern doors. After being painted in Building 83, the S-3A aircraft returned through the eastern doors and proceeded west along the southern wall, and exited through the southern doors.

Hydraulic system check-out for the S-3A was performed along the north wall of the building. Hydro-gigs, which were housed in two acoustical enclosures ("hydro cabañas") outside of the north wall of the building, supplied hydraulic power for these tests through piping located in trenches along the north side of the eastern end of the building. The trenches were designed so that any spilled fluids would drain back to the hydro cabañas, where 3-foot deep rock-filled pits allowed the fluid to drain into the soil. Two floor drains in the western cabaña and three floor drains in the eastern cabaña were installed to collect hydraulic fluid that spilled from the hydro-gigs. A 1977 facility drawing indicates that the floor drains discharged to underground tanks (designated B-6-M and B-6-N) located just outside of the cabañas. It is not clear what the drains discharged to prior to the installation of the

underground tanks. Design drawings indicated the tanks had capacities of 72 gallons each, but 1984 and 1989 leak detection and tank removal investigations indicated the tanks had 160-gallon capacities. Facility personnel recalled that on at least two occasions hydraulic fluid from the eastern hydro cabaña spilled out onto the paved area between Buildings 304 and 309. After the S-3A program left Building 304, the hydro cabañas were used for drum storage, and, for a time, the eastern hydro cabaña was used by facility air conditioning maintenance personnel as an office and shop. A sink in this air conditioning shop reportedly discharged to the ground at the site. Hydro-gigs and air conditioning units were also located outside of the southern wall of Building 304. The southern hydro-gigs and air conditioning units were used for testing S-3A aircraft on the south side of the building through piping in the southern trench and through sub-floor air ducts.

During aircraft assembly operations in Building 304, solvents were commonly used in small quantities for minor cleaning. The solvents most typically used were MEK, MIBK, TCA, IPA and Stoddard solvent. Solvents were dispensed from chemical storage areas in each work area to safety cans or plastic bottles for wipe cleaning with rags. Dirty rags were placed in metal cans for collection and off-site disposal. Paints were used in the spray paint booth and the howdah. Paints for the howdah were stored in Building 305. Details of the maintenance and cleaning of the painting equipment associated with the booth and the howdah are not known. Since 1988, chemical dispensing has occurred from a fenced hazardous materials storage area located on the north side of the building between columns N and P. In the trim shops and wood shops, glues and other adhesives were commonly used. The tank seal operation used Buna-n (a synthetic rubber material), Stoddard solvent, and perhaps MEK and MIBK. The tank seal solvents were reportedly dispensed and reused from aboveground tanks located at the tank seal area. Waste fluids were typically drummed for collection and disposal or recycling off-site. For the S-3A program, Freon gas was stored in cylinders near column Z on the south side of the building and were moved in 1976 to a location between columns U and V. The Freon was used to charge air conditioning systems of the S-3A aircraft. The aircraft and avionics test room cooling units, which were located outside of the south wall of the eastern end of the building, used Freon 22 refrigerant. Initially, a carbon dioxide fire suppression system was used for the avionics test rooms; that was later replaced with a Halon system. Minor quantities of IPA and Freon were reportedly used in the avionics system test rooms for electrical component cleaning.

The eastern end of Building 304 was left unused from 1979, when the S-3A moved out, to 1985, when Ground Support Equipment (GSE) and Static Signature Structures operations moved into the building. GSE constructed, assembled, and/or tested equipment that assisted aircraft flight operations, including aircraft start-carts, hydro-gigs, ordnance loading equipment, etc. Static Signatures manufactured and tested equipment used in radar signature tests. These two operations involved the use of metal machining equipment, welding machines, a wood shop, and foam shaping equipment. Static Signatures occupied part of the building until 1990, and

GSE was in the building until mid-1991, when the building was evacuated. Chemicals used in these operations included moderate amounts of Stoddard solvent, IPA, toluene, acetone, paints, epoxies and other adhesives, oils, hydraulic fluids, welding gasses, soldering fluxes, jet fuel, and kerosene. Solvents and kerosene were used for occasional cleaning of parts, primarily during machining operations. Painting was limited to occasional touch-up or stenciling, primarily using paint spray cans. Oils and hydraulic fluids were used in machining equipment and in hydro-gigs. Many pieces of the metal machining equipment have self-contained oil reservoirs and oil recirculation systems. Minor amounts of jet fuel were infrequently used in equipment that GSE built or repaired. Waste chemicals were placed in hazardous waste storage cabinets for collection and disposal or recycling off-site.

Bulk storage of solvents, paints and oils for use in Building 304 took place in Building 305, in the blast fence due west of Building 304, and since 1988 in the fenced enclosure approximately 200 feet west of Building 304, in Parcel 1. The blast fence and fenced storage area in Parcel 1 are described in the Parcel 1 environmental assessment report (McLaren/Hart, 1991).

A loading dock along the south side of the eastern end of Building 304 was reportedly used for temporary storage of damaged parts, domestic trash, and occasionally, drums of virgin and/or waste materials. The dock has not been used in this capacity since the early 1970s or earlier.

4.4.2.2 Building 304 Annex

The Building 304 Annex has been used as office space for the various projects that have been conducted in Building 304 and as office space for other Plant B-6 operations, such as purchasing and mail sorting.

4.4.2.3 Building 305

Building 305 has been used for bulk storage of hazardous and flammable materials such as paints and solvents. Materials stored in Building 305 were used in Buildings 304, 309 and 310. The eastern part of this small building was also used in the last few years by maintenance painting personnel as a locker room. The building is not currently being used.

4.4.2.4 Building 306

Building 306 was used from 1954 to 1964 as a cafeteria. From 1964 to the present, the eastern part of the building has been used by Factory Transportation as their office and dispatch facility. The rest of the building was used for dry storage, including customer and government owned equipment. Starting in 1985, the middle portion of the building was used by GSE for testing hydro-gigs and for dye penetrant (Zyglo) application and parts inspection. The parts inspection was termed "material

withholding" by facility personnel. Government-owned hydro-gigs were tested in the open-fronted portion of the building. Hydraulic oils were used in this area, and minor spills were reported to have occurred. For a period of approximately two months, these hydro-gigs were steam cleaned in the paved area north of the testing area. The Zyglo room was located just west of Factory Transportation's offices. Dye penetrant was sprayed onto parts, and then the parts were inspected for cracks. For a time, the spray application occurred over the storm drain trench along the north side of the building. GSE used a Stoddard solvent degreaser that was located in the covered area at the western end of Building 306. Factory Transportation has also parked equipment in this covered area.

4.4.2.5 Building 308

Aerial photographs from 1942 show the presence of a darkly-stained area and approximately one dozen drums just south of Building 304 in the area now occupied by Building 308. Building 308 was constructed as a rest room facility in 1944. In approximately 1986, the eastern end of the building was converted for use as a photography portrait studio. The studio included one room that was formerly a men's rest room. The photography studio did not use any chemicals; rather, only film and photography equipment was used in the studio. Film was stored in refrigerators in one of the rooms. The western two-thirds of the building still function as rest room facilities. No chemicals other than typical janitorial materials are used in Building 308.

4.4.2.6 Building 314

Building 314 houses an 1,000-kVA electrical substation (known as Substation N) for Building 304. The electrical equipment in this area formerly fed substations located at flight lines to the west of Building 304 (Substation R) and to the south of Building 304 (Substation T). A 1967 facilities drawing indicates that oil-filled circuit breakers on the transformer equipment were to be replaced. It is not known whether the oil contained PCBs.

4.4.2.7 Building 325

Building 325 was built in 1964 as a cafeteria to replace the former cafeteria at Building 306. For the last several years, Building 325 has been used as office space for LADC Security. A small area near the center of the building is used as a credit union automated teller machine annex. No chemicals other than typical janitorial materials are used in Building 325.

4.4.2.8 Building 399T

Building 399T is a portable unit that was installed in 1982 for use by the radio shop. The eastern portion of the building includes offices and shop areas used for maintaining the security and maintenance departments' radios. Minor repairs to radios are conducted in the building, and brackets used for installing radios in vehicles are fabricated here. The technicians in Building 399T use very small amounts of solder, flux, flux cleaner, and contact cleaning materials. The western portion of the building includes some offices for the personnel department. No chemicals are used in the personnel department offices.

4.4.3 Previous Investigations

Previous investigations relating to Building 304 include 1984 and 1989 underground tank investigations. Three tanks were present at Building 304: B-6-F25, B-6-M, and B-6-N. A brief discussion of investigations at each tank is presented below.

Tank B-6-F25 was an underground diesel tank located at the southwestern exterior of Building 304 (see Figure 4-8). Gregg and Associates investigated this tank in 1984 during the leak detection program. A 16-foot deep soil boring west was drilled north of the tank, sampled at the 15-foot depth, and completed as a vapor monitoring well. The laboratory soil sample analysis for TPH detected 1.27 ppm. Gregg and Associates attributed the detected hydrocarbons to surface spills during tank filling. The City of Burbank Fire Department issued ENSR a permit to remove tank B-6-F25 in February 1989. ENSR removed the tank in May 1989 and collected two soil samples from the excavation. TPH was not detected in the samples (detection limit of 10 ppm).

Tank B-6-M was an underground tank located north of Building 304 at the northwest corner of the eastern hydro cabaña. The tank collected spilled fluids from the hydro cabaña. Gregg and Associates indicated that the cabaña was used for chemical storage. The tank reportedly contained solvent waste. Gregg and Associates sampled the liquid from the tank in 1984 for volatile organic compound and CAM metal analysis. The laboratory results indicated that 7.0 mg/kg MIBK and "trace" amounts of acetone and methanol were present, as well as cobalt, mercury, selenium, and zinc, which were detected at levels below the STLC limits. Gregg and Associates also completed two soil borings adjacent to tank B-6-M in 1984 to determine if the tank contents had been released to soil. One boring extended to a depth of 40 feet and the second boring extended to a depth of 13 feet. The 40-foot deep boring was sampled at depths of 6, 9, 14, 24, and 40 feet and was completed as a vapor monitor well. The samples were composited and analyzed for volatile organic compounds and CAM metals. The laboratory results indicated that no volatile organic compounds were detected (detection limits were not reported) and arsenic, barium, chromium, cobalt, copper, nickel, vanadium, and zinc were detected, but at levels below 10 times

the STLC limits. The 13-foot deep boring was completed as a suction lysimeter and was sampled at the 12-foot depth. Although the laboratory program was to include the analysis of the 12-foot deep sample for pH, CAM metals, and volatile organic solvents, the samples were either not analyzed or the results not included in the report. Gregg and Associates concluded that the tank was not leaking.

ENSR investigated tank B-6-M in 1988 with one 40-foot deep soil boring that was sampled at the 15- and 40-foot depths. The samples were analyzed for volatile organic compounds, and no compounds were detected (detection limits of 5 to 50 ppb). The City of Burbank Fire Department issued ENSR a permit to remove tank B-6-M in February 1989. The tank was excavated in March 1989, a soil sample was collected from the excavation, and analysis results reported 7,390 ppm TPH. ENSR drilled a 41.5-foot deep soil boring in the area of the former excavation in June 1989 and collected samples at the 15- and 40-foot depths for volatile organic compound (VOC) and TPH analyses. The laboratory results stated that no chemicals were detected (detection limits of 10 ppm TPH and 5 to 50 ppb VOCs). ENSR concluded that the TPH contamination extended approximately 5 feet below ground surface and no more than 5 feet radially from the center of the tank. They estimated that 125 cubic-feet of impacted soil was present at the former tank site.

Underground tank B-6-N was located north of Building 304 and at the northeast corner of the western hydro cabaña. The tank collected spilled fluids from the hydro cabaña. Gregg and Associates indicated the cabaña was being used for chemical storage. Gregg and Associates investigated the tank in 1984 by collecting a liquid sample from the tank and drilling two soil borings around the tank. The liquid sample was analyzed and found to contain the following compounds: 11 ppm isobutyl acetate, 98 ppm acetone, 20 ppm methanol, 170 ppm isobutyl alcohol, 130 ppm IPA, 190 ppm MEK, and 490 ppm MIBK. The liquid sample also contained cadmium, chromium, copper, lead, mercury, nickel, selenium, and zinc in concentrations less than the STLC. One of the soil borings extended to a depth of 40 feet and the second boring extended to a depth of 13 feet. The 40-foot deep soil boring was sampled at depths of 9, 14, 24, and 39 feet and was completed as a suction lysimeter. The 9-foot deep sample was analyzed for organic solvents and 105 ppb benzene and 28.8 ppb toluene were detected. The 24- and 39-foot deep samples were composited and analyzed for organic compounds, and 25.4 ppb carbon disulfide was detected. The 13-foot deep soil boring was drilled, sampled at a depth of 12 feet, and completed as a suction lysimeter. The laboratory analysis detected 20 ppm butyl acetate and 5.6 ppm carbitol in the 12-foot sample. Gregg and Associates concluded that there was no record of tank B-6-N storing any of the solvents detected in the soil, and if the tank were leaking, the concentrations in the soil ". . . would be expected to be much higher." The origin of contamination detected in the soil was attributed to surface spills. Horner Creative Metals, Inc. hydrostatically tested tank B-6-N under the direction of Gregg and Associates in May 1985, and the tank was certified tight.

ENSR investigated tank B-6-N in 1988 with one 40-foot deep soil boring that was sampled at depths of 8 and 40 feet. Laboratory results indicated that no VOCs were detected (detection limits ranged from 5 to 50 ppb). The City of Burbank Fire Department issued ENSR a permit to remove tank B-6-N in February 1989. ENSR removed the tank in March 1989, collected one soil sample from the bottom of the excavation for TPH analysis, and reported that the soil contained no TPH (detection limit of 10 ppm).

4.4.4 Site Inspection

A site inspection was performed of the interior areas of Building 304, the adjacent buildings, and the surrounding exterior areas. The areas outside of the adjacent buildings are addressed in the discussion of the exterior of Building 304.

4.4.4.1 Building 304

Building interior. This discussion of the site inspection begins with general building characteristics and then proceeds from the western end of the building to the east. Figure 4-9 shows the use areas present at the time the building was inspected, as well as a few former features and use areas. At the time of inspection, little manufacturing or assembly activity was being conducted in Building 304. Much of the building was occupied by unused work benches and stored equipment. The concrete floor of the building is in good shape, with no significant cracking or deterioration. Numerous concrete construction patches are present on the floor where utilities have been installed. The utility pits, about 100 of which are located throughout the floor of the building, have earthen bottoms, and some have minor to moderate staining. The utility pits have compressed air and/or electrical outlets. The steel-plate-covered utility trenches are concrete-lined and for the most part have little or no staining. The primary exception to this is the utility trench in the northeast part of the building, which is heavily stained (see Figure 4-8).

The southwestern corner of the building, from columns A to E and from the southern wall to near the building centerline, contains work benches, desks and filing cabinets. There is little or no chemical use in this area. Near the centerline of the building, between columns A and C, is a large concrete-lined pit with steel plate cover, and four patches bounded by 2-inch wide angle iron pieces that appear to be former pits that are filled with concrete. Facility personnel were not able to positively identify the former use of these pits; however, they may have housed scales for weighing aircraft. The large concrete-lined pit contains a four-inch pipe and flexible hose that terminate in the grated trench located just outside of the western doors. It is not known what the pipe was used for. The pit is clean, with no signs of staining.

A small, self-contained sand blast cabinet and a large, walk-in-type sand blast booth with a bag house dust collector are located about 50 feet south of the northern wall of the building, at columns B and C, respectively. Metal parts are sand blasted

within the units to clean off welding scale or other deposits. These units are permitted by the SCAQMD (permits M58847, M58848, D00824 and D00825). Dust is bagged and disposed of by a licensed contractor. A wood shop occupies the area north and east of the sand blasters, from column A to F. The shop has saws, sanders, jointers, planers, other wood working equipment, and work benches. Wood glue is the principal chemical used in the wood shop. Dust from the equipment is ducted to a dust collector that is located outside of the building, just north of column B. Just east of column C, a few feet from the north wall, there is a floor drain with steel grate that measures approximately two-foot square (see Figure 4-8). It is unknown what this drain discharges to or what its primary purpose was. Along the floor of the wood shop there is evidence of a former mezzanine that was supported by steel columns. The columns have been cut off flush with the floor, but can still be seen. Immediately east of the wood shop, at column G, is a project display board and a break area with picnic tables.

Between columns G and H in the north half, and columns E and I in the south half of the building, there are metal working and machining areas. These areas contain shears, breaks, punches, drills, grinders, lathes, mills, other associated metal working equipment, and work benches. Some of the machines have metal drip pans beneath them. Minor amounts of oil are present on the floor around many of the machines, and an oil absorbent is commonly used on the floor of these work areas.

In the northern half of the building between columns H and M, there is a welding and cutting area. A canvas and plastic sight barrier surrounds most of the welding area. This area contains welding machines, a flame cutting table, set-up tables, welding gas bottle racks, metal storage racks, welding tables, and other work benches. Welding gasses used in this area include oxygen, acetylene, helium, and argon.

In the southern half of the building, between columns I and Q, there are work benches, inspection areas and desks. This area appeared to be inactive at the time of inspection. A 2-foot by 2-foot by 3-foot deep pit is located near the south wall, between columns K and L. The pit has vanes that formerly directed air into a sub-floor duct that terminated near the centerline of the building. No staining was observed in the pit. Approximately 50 feet north of the southern doors, between columns Q and S, are two patches bounded by imbedded two-inch wide angle iron that appear to be former pits that are filled with concrete. These apparent concrete-filled pits are identical to those believed to have housed scales that are located in the western end of the building. Also near this location is an arcuate-shaped steel rail set in the concrete floor, with a radius of approximately 40 to 50 feet. The purpose of the rail is unknown.

The building's hazardous materials storage area has been located on the north side of the building between columns N and P since 1988. This fenced area contains shelves of non-flammable materials, cabinets with corrosive, flammable and combustible materials, and freezers with temperature sensitive epoxies. Material

from this storage area is weighed prior to disbursement and after the remaining material is returned, in order to produce records of the quantities of materials used. The floor of the area shows no sign of staining or material spillage. An emergency eye wash station is located within the facility. A tool crib is present immediately south of the hazardous materials storage area.

A former paint booth was located between columns O and P, at the current location of the hazardous materials storage area. The only evidence of the former paint booth was the presence of a sump and drain pipe between columns P and Q, near the north wall (Figure 4-8). The sump measures approximately 2-feet by 2-feet by 2-feet deep. Dried sludge was present in the bottom of the sump at the time of inspection. A drain pipe from the sump appeared to run south under the floor of the building, towards the sewer or storm drain lines located just south of the building.

Near the building centerline, from columns F to S, there are two parallel lines of 8-inch diameter steel pipes whose tops are flush with the concrete floor. Approximately half of the nearly 30 pipes have plates welded to their tops or have covers that did not allow the pipes' inspection. They are indicated on Figure 4-8 by small circles and the letter U. The pipes that had removable covers were between 9.5-and 13.5-feet deep. Four of the pipes between columns G and K contained liquid that appeared to be hydraulic fluid (see Figure 4-8). They are indicated on Figure 4-8 by small circles and the letter L in parentheses. The purpose of these pipes is not known. It is also unknown whether the pipes have sealed bottoms; however, it appears that they are open to the soil, as the fluid level in at least one pipe was observed to have dropped in the time between two inspections.

The area between columns Q and T, on the north side of the building, contains several picnic tables and approximately one dozen work benches. The picnic tables were being used as a break and lunch area. A facility drawing shows two vacuum pumps near column Q, about thirty feet south of the north wall; however, no evidence of their presence was found. A steel-plate-covered pit is located between columns S and T, about 15 feet south of the north wall. The pit measures approximately 4 feet by 6 feet by 3 feet deep. The pit has concrete walls and floor, and there are no inlet or drain pipes associated with the pit. The floor of the pit contained a minor amount of debris, but did not look stained. Former usage of this pit is not known.

Another metal working area is located between columns T and Z on the north side of the building. This area contains a drill press, a spot welder, a band saw, a hydraulic press, two punches, metal shears, and two breaks. No staining of the floor was noted in this area at the time of inspection.

A trim shop is located on the north side of the building between columns Z and AA. The area contains work benches, sewing machines, material storage rolls, and storage cabinets. No chemical use was noted in this area, and no staining was visible on the floor of the trim shop.

A work area between columns Q and AA, on the south side of the building, contains approximately 30 work benches and a few pieces of metal- and wood-working equipment. The equipment in this area includes belt sanders, drill presses, grinders, and table saws. At the time of the first inspection, a foam shaping device was located between columns T and U, near the south wall of the building. This device was not, however, present in subsequent inspections of the building. No staining was noted on the floor of this work area.

Complete inspection of the inactive rest rooms that abut the south side of the building at columns V and W was not possible due to blocked access. Rest room fixtures were the only objects visible through the windows.

The former compressor room that is located between columns X and Y, south of the southern wall of the building, contains several work benches and a large compressed air tank. Access to this room is from inside of Building 304. Patches in the floor were evident where the former air compressor and associated piping was located. The presence of several large cabinets and desks prevented inspection of the extreme southeast corner of the room, where the former emergency generator and floor sink were located. No staining was noted on the floor of this room.

The former electrical substation shed that is located immediately east of the compressor room contained no electrical equipment at the time of inspection. Bolts are present in the floor where the former electrical equipment racks were located. The room is being used for miscellaneous dry storage. A 2-foot by 2-foot steel plate covered what appeared to be a compressed air valve box in the northwest corner of the room. No staining was visible on the floor of this room.

The former S-3A Avionics System Test facility, which is located on the south side of Building 304 between columns Y and FF, was not being used at the time of the inspection, except for some computer storage. The floor of the eastern two rooms of the facility are covered with vinyl floor tiles. Acoustical tiles cover the ceiling of all three rooms. Beneath the raised portion of the central room floor, the concrete floor of the building is visible, as are electrical and communication cables for the former test equipment. No staining was visible on the floor of the facility.

Immediately east of the avionics room is a scale for weighing small to medium sized parts. The scale is set into a pit such that the top surface of the scale is nearly flush with the floor. The scale prevented access for inspection of the pit.

The remainder of the building (east of column AA and from the north wall to approximately 30 feet from the south wall) is enclosed by a chain-link fence and is used for stock and equipment storage and for a production control office. The production control office is located at column FF in the southeast portion of the fenced area. The office has vinyl floor tiles, several desks, and computers. Racks of small parts storage cover most of the floor space of the fenced area. In the northeast corner of the fenced area there are several pieces of metal machining equipment that have been taken out of service. A utility trench in the northeast corner of the building near column EE is heavily stained with oil. This trench formerly carried hydraulic fluid lines for the S-3A hydraulic system check-out stations. No staining was visible on the floor in the parts storage and equipment storage areas.

Building exterior. The area around Building 304 has been paved since the early 1940s. Most of the asphalt paving is in good condition. Surface runoff from around the building flows south-southwest, except on the northern side of the building, where the ground slopes north to storm drain catch basins located between Buildings 304 and 309/310. The grated, concrete-lined storm drain trenches along the west end of Building 304 and the north side of Building 306 contain some dirt and other debris. The sand trap near the northwest corner of Building 306 is partially filled with sand and other debris.

A Stoddard solvent degreaser tank is located under the covered area on the west side of Building 306. Minor to moderate staining is visible on the concrete around the degreaser. Some minor oil staining is present on the pavement on the east side of Building 306, perhaps from the temporary storage of some equipment. The pavement in the shed on the east side of Building 399T is stained with oil from the Factory Transportation equipment that is parked there.

The floors of the two hydro cabañas are heavily stained with oil. The rock-lined drain sumps in the cabañas are also heavily stained. The western cabaña was empty of equipment, and the eastern cabaña contained a sink and cardboard boxes at the time of inspection. It was not possible to see where the sink drained to, due to limited access; however, former facility personnel indicated that the sink was used by air conditioning maintenance personnel and that it discharged to the ground or possibly to the hydro cabaña drain sump. Concrete patches cover the locations of the former underground tanks B-6-M and B-6-N in this area. An inactive heat exchanger unit is present on a concrete pad between the two cabañas. No staining was visible at that location. Concrete footings for a former dust collector are present immediately east of the eastern hydro cabaña. A compressed air valve pit is located between the eastern hydro cabaña and Building 325, adjacent to the north wall of Building 304. The steel cover over the pit was stuck and did not allow inspection of the pit.

At the southeast corner of the building there is an elevated dock that was formerly used as a trash dock. The face of the dock is concrete and the dock is paved with asphalt and concrete. This dock area allows access to the shed that is located east of the compressor room. A covered pit is located at the southeast corner of Building 304 adjacent to the wall. It appears that the pit is connected to the pit beneath the scale in the southeast corner of Building 304, although this could not be confirmed. The pit cover is bolted on and the pit could not be inspected. Along the southern exterior wall of the building, at the eastern end, are electrical outlets, hydraulic fluid piping and transite air duct connections for the hydro-gigs and air conditioning units that were used during the S-3A program (see Figure 4-8). Associated with the air conditioning units are condensate drains that are composed of a piece of clay pipe buried vertically in the ground and filled with gravel. The tops of the drain pipes are located above grade to prevent spilled materials or surface runoff from entering the drains. Also along the southern wall in this area are a 400-cycle power unit, an inactive compressed gas fire suppression system, and the air conditioning condenser for the air conditioning units that were used by the avionics lab. The area around the air conditioning condenser is stained with oil, and oil soaked absorbent material is spread around the unit's base. No other significant staining is present along the south exterior wall of Building 304 east of the shed and compressor room. A one-inch vent pipe is located on the south wall of the building approximately 5.5 feet east of the shed, near column Z. No other evidence was observed of the underground tank for the former emergency generator. It is unknown whether the tank was ever removed.

Electrical outlets, hydraulic fluid piping and transite air ducts are present on the west side of the inactive rest room facility that is located immediately west of Building 314. The piping and ducts extend north into Building 304. The hydro-gig and air conditioning cart that were formerly located here were also used for the S-3A program. No staining is present in this area.

4.4.4.2 Building 304 Annex

The ground floor of the Building 304 Annex contains office space (most of which was not being used at the time of inspection) and an air conditioning room. The offices have vinyl floor tiles over the concrete subfloor. The ceilings are wood. The air conditioning room is located near the center north side of the Annex. The air conditioning room has a concrete floor. A large heat pump unit is located in the room. No staining is present around the heat pump. Numerous small, through-the-wall air conditioning units are also present in various rooms in the Annex. The second floor of the Annex contains office space and rest rooms. The second floor offices have carpeting over wood floors. The second floor offices were not occupied at the time of inspection.

A concrete patch is visible over the former underground diesel tank (B-6-F25) that was located approximately 20 feet south of the Building 304 Annex. The former monitor well is also visible adjacent to the patch. It is unknown what the tank supplied, but it appeared to have supplied a heating unit that was on the roof of the Annex. Three 3/4-inch pipes run up the wall of the Annex north of the former tank's location. A heating unit on the roof of the Annex is currently plumbed to natural gas.

4.4.4.3 Building 305

Building 305 was not being used at the time of inspection. The eastern part of the building is enclosed by wood-frame and sheetrock walls and contains a table, chairs, and several lockers. The western part of the building has heavy paint staining on the floor and walls. The concrete berm that encloses the north side of the building is breached in two places such that it would be possible for spilled fluids to flow onto the pavement north of the building, but there is no indication that this has occurred. The ceiling of the building is deteriorated, exposing the concrete reinforcing wire.

4.4.4.4 Building 306

The westernmost room in Building 306 is being used for storage of miscellaneous items, primarily computer display monitors. The concrete floor of the building is in good condition, with no staining.

At the time of inspection, the hydro-gig test area contained a hydro-gig, pressure test and other test equipment, hydraulic hoses and fittings, and racks of welding gasses for use in Building 304. Small amounts of oil from the hydro-gig and associated hoses were observed on the floor of the test area.

The dye penetrant room, also known as the Materials Withholding Area, contains several desks, work benches, and a vacuum table. The vacuum table is where dye penetrant spray has been applied for the last year or so. No staining was observed on the concrete floor of the room.

The Factory Transportation offices occupy the easternmost portion of Building 306. This area includes a locker room and miscellaneous storage areas, in addition to the dispatch and manager's offices. The floors are either bare concrete or are covered with vinyl floor tiles. Several quart cans of motor oil are stored in a cabinet on the eastern wall of the locker room. The oil is used in the fork lifts that are parked near Building 309. One room contains water and electrical utilities that facility personnel indicated were from the building's former use as a cafeteria. No staining was observed on the floors of the Factory Transportation offices.

4.4.4.5 Building 308

Building 308 contains the rest room facilities for Building 304 and a photography portrait studio. The floors of the rest rooms are concrete and contain several floor drains. A janitorial closet contains a sink and janitorial cleaning products. The photography studio contains desks, miscellaneous photography equipment, and two refrigerators for holding film. A floor drain is visible in the concrete floor of the western room of the studio, as are the boarded-over urinals, relics of the room's former use as a rest room. The floor of the eastern room of the studio is covered with vinyl tiles. No staining was visible in the photography studio.

4.4.4.6 Building 314

Building 314 contains electrical transformers and related equipment. The electrical equipment is located on a concrete pad within the brick-walled building. No staining was observed on the concrete pad or on the bare soil surface that surrounds the pad. Because entry into the building was restricted due to the potential for electrocution, inspection of the steel-plate-covered pit along the building's southern wall was not possible.

4.4.3.4.7 Building 325

Building 325 contains office space, a rest room, and an automated teller annex. The floors of the building are covered with carpet, except for the rest room, which is tile covered. No stored chemicals or staining were observed in the building. Features associated with the building's former use as a cafeteria were not observed.

4.4.4.8 Building 399T

Building 399T contains two offices and two work rooms in the eastern portion of the building that are used by the Radio Shop, and three offices in the western portion of the building that are used by the Personnel Department. The floors of the building are covered with vinyl flooring. Cabinets in the Radio Shop hold flux cleaners and small quantities of other cleaners. A small drill press and a grinder are present in one of the work rooms. No staining was observed in Building 399T.

4.5 BUILDING 309/310

Building 309/310 is located in the southern portion of Plant B-6, Parcel 2, between Buildings 304 and 311. Building 309 was constructed in 1944, and in 1954 Building 310 was added to the eastern end of Building 309. The combined building consists of an aircraft assembly hangar with mezzanines along the north and south walls. Prior to 1944, a ranch house and flight line support buildings existed at this location (refer to the Aerial Photography Review section for additional information). Buildings 309 and 310 have been used primarily for aircraft final assembly operations. Prior to 1954, final assembly of P-38, Constellation, and P-2V aircraft was conducted within Building 309. Final and component assembly of Constellation, P-3, SR-71, L-1011, S-3A, and F-117A aircraft were conducted at Building 309/310 after 1954. The most recent configuration of Building 309/310 is shown on Figure 4-10. Information on the current and historical use of Building 309/310 was provided by the following Lockheed personnel: Mr. Ivan Brice, Mr. William Detmer, Mr. George Gardoni, Ms. Pat Marquis, Ms. Betty McDermitt, Ms. Gayle Miller, Mr. Bill Robinson, Mr. Steve Smetzer, Ms. Gladys Striglers, Mr. Gus Villanueva, Mr. Harley Waggoner, and Mr. Don Wilson.

4.5.1 Construction Details

Building 309/310 is a steel truss-frame structure with a concrete slab floor. The building has approximately 410,000 square feet of floor space including 170,000 square feet on the mezzanines. The building was constructed with a brick walls extending 4 to 6 feet above grade and corrugated metal siding covering the rest of the approximately 60-foot high walls. Large, sliding, hangar doors enclose the west and east sides of the building. Wood-covered pits are located along the north and south walls of Building 309/310 at each set of truss members. The pits contain the connections between the building foundation and trusses. The pits have concrete walls and bottoms. Four levels of mezzanines, containing offices, labs, and dry parts storage areas, are located on the north and south walls of Building 309/310. The mezzanine areas have fluorescent lighting, suspended acoustic tile or exposed ceilings, and linoleum tile floors. The first mezzanine along much of the south wall of Building 310 was extended more than 100 feet toward the center of the building in the 1970s to create additional storage space on the mezzanine and office space on the ground floor level. The building is heated by 12 furnaces (formerly oil-fired, now natural gas-fired) that are located along the north and south walls of the building.

The utility pits and trenches, which were constructed throughout the building, contain compressed air, electrical, and air conditioning utility lines, ducts, and outlet connections. The utility pits, 1-foot by 2-feet by 1-foot deep, commonly have concrete sides, soil bottoms, and steel plate covers. Building 309/310 has one utility trench network, north of the building's centerline, that spans the entire length of the building. The utility trenches are typically 1 foot wide and deep and have concrete-lined walls and bottoms and steel plate covers.

A metal finishing line was formerly located at columns L6-L9 in Building 310. The process line contained a degreaser within a concrete pit and five aboveground process tanks within a shallow concrete containment basin. The degreaser pit, located at column L8, measured 13-feet by 21-feet by 7-feet deep, and had a small sump and pump on the south end. Spilled fluid from the degreaser operations drained into the sump and was pumped to a sand trap located outside the north wall of the building. From the sand trap, the waste fluid flowed into a storm drain line adjacent to Building 309/310. The degreaser was constructed of zinc-coated steel and contained two dip chambers and three internal storage tanks. The TCE-filled hot dip and rinse chambers had capacities of 732 gallons and 825 gallons, respectively. The degreaser storage tanks had capacities of 394, 455, and 828 gallons. A TCE still was located just east of the degreaser, and it received spent TCE from the degreaser, distilled it, and replenished the degreaser with clean solvent.

The process line containment basin was located immediately west of the degreaser pit. The containment basin sloped to the north and measured 12-feet by 15-feet by 9- to 16-inches deep. The five process tanks were constructed of steel, and one tank had a stainless steel inner lining. The tanks each had a capacity of approximately 500 gallons and measured 2.3-feet by 10-feet by 3-feet deep. The tanks were arranged side by side within the containment basin. Spilled fluid from the process line tanks collected in a trench on the north side of the containment basin and drained into an adjacent sand trap located just inside the north wall of the building. From the sand trap, the waste fluid discharged into a sanitary sewer line north of Building 309/310. The degreaser and process line sand traps, one located inside Building 310 and the other outside the building, were concrete-lined and measured 2½-feet by 6½-feet by 3½-feet deep.

An oil-fired boiler heated the process line and degreaser tanks. The boiler was located just north of the process line and had a two-foot diameter cylindrical blowdown tank that was located in a four-foot wide by five-foot long pit outside the north wall of the building at column K7. The depth of the pit and construction details of the pit and blowdown tank are unknown. The boiler was fueled from an underground tank (B-6-F21) that was formerly located east of Building 311A, where Building 311B is now. This tank is discussed in more detail in the section on Building 311.

Another metal finishing process line was located at columns L16-17 in Building 310. Information is limited on the construction details of this process line; however, one facility drawing indicated the presence of at least three aboveground tanks. The tanks were similar in size to the process line tanks at columns L6-L9.

A heat treatment facility was formerly located near column K16 of Building 310. The facility included a furnace and a quench water tank. The three-foot diameter quench tank was concrete lined and extended approximately 12 feet below the floor.

Overflow from the quench tank was pumped to an adjacent sand trap, and from there it drained to the storm drain located north of Building 309/310. The electrically-heated furnace was located just above the quench tank.

Building 309/310 has two electrical substations, two along the north wall and three along the south wall of the building. The two substations adjacent to the north wall are located at columns L18-L19 in Building 309 and at columns L20-L21 in Building 310. The north wall substation in Building 309 contains dry-type air-cooled 750- and 225-kVA transformers, and a 100-kVA transformer that formerly had oil switches. In 1988, the oil switches, which contained 27 gallons of liquid with PCB levels exceeding 500 ppm, were removed from the 100-kVA transformer. The north wall substation in Building 310 formerly contained dry-type air-cooled 750- and 112½-kVA transformers. The 112 ½-kVA transformer was replaced, and the substation now has a 300-kVA transformer in addition to the 750-kVA transformer. The three substations adjacent to the south wall are located at columns M18-M20 in Building 309 and columns M9-M10 and M18-M21 in Building 310. The south wall substation in Building 309 contains dry-type air-cooled 300- and 100-kVA transformers. The 100-kVA transformer formerly contained an oil switch that was subsequently replaced with a dry-type switch. The substation located at columns M9-M10 in Building 310 contains a dry-type air-cooled 1,500-kVA transformer, while the other substation located at columns M18-M21 contains dry-type air-cooled 300- and 112½-kVA transformers. Building 309/310 contains four rafter-mounted transformers, consisting of three dry-type air-cooled 150-kVA transformers in Building 309 and one dry-type air-cooled 225-kVA transformer in Building 310.

Building 309/310 has four freight elevators, two each located near the north and south walls. The north wall elevators are located at columns L27-L28 in Building 309 and L27-L28 in Building 310. The south wall elevators are located at columns M27-M28 in Building 309 and M27-M28 in Building 310. Facility drawings show that each elevator has a below grade 8-foot by 12-foot by 5-foot deep concrete-lined pit and 40- to 50-horsepower hydraulic pumps to operate the elevators.

A loading dock located outside the south wall of Building 309/310 was constructed in 1945 and extended eastward in 1954. The portion of the dock located outside Building 309 is covered with a metal awning. The loading dock is constructed of concrete and is approximately 20 feet wide and 300 feet long.

Facility drawings show 13 underground diesel fuel tanks outside the north and south walls of Building 309/310 (Figure 4-10). Twelve of the tanks supplied diesel fuel to 12 furnaces located inside the north and south walls of the building. The thirteenth tank (B-6-F21) supplied a process line boiler and boilers at Building 311. This tank is discussed in the section on Building 311. The 12 steel tanks that supplied the furnaces had 2,500- to 3,000-gallon capacities. Tanks B-6-F9, -F10, -F11, -F12, -F13, and -F14, located outside Building 309, were installed in 1944 and 1945. Tanks B-6-F15, -F16, -F17, -F18, -F19, and -F20, located outside Building 310, were

probably installed in 1954 when Building 310 was constructed, rather than in 1945, as reported by Gregg and Associates, Inc. (Gregg and Associates, 1985). These 12 tanks were closed in place in 1989.

Several small to medium-sized air conditioning units are located inside and outside Building 309/310. Eight air conditioning units are located outside the north wall of Building 309/310 and three are located outside the south wall of Building 310. Another air conditioner is located at column K16 in Building 310. The air conditioning units service the mezzanines and hangar area.

4.5.2 Previous Operations and Present Use

Buildings 309 and 310 were constructed for aircraft component and aircraft final assembly operations. From 1944 to 1954, Building 309 was used for aircraft final assembly of P-38, Constellation, and P-2V aircraft. After Building 310 was built onto the east end of Building 309 in 1954, SR-71, S-3A, and P-3 aircraft were assembled at the facility, from the mid-1950s to approximately 1978. In addition, component assembly for the SR-71 and L-1011 aircraft was conducted during this period. Since approximately 1978, component and final assembly of the F-117A aircraft has been conducted in Building 309/310. Currently, much of the hangar area of Building 309/310 is used for storage in addition to component assembly for the F-117A aircraft. The component assembly process utilizes a machining area in the southeast portion of Building 310 and a component assembly area in the south-central area of Building 309. Molds, jigs, dies, and other final and component assembly equipment are stored on the floor of the hangar. The mezzanine areas are currently either vacant or contain offices and laboratories which support the component assembly operations. The laboratories are used to conduct electronics testing and develop photographic film.

Building 309/310 was designed to allow final assembly of aircraft by two different pathways. The aircraft could either enter from the east into Building 310 and exit to the west through Building 309, or enter and exit through the same door in a loop pattern. If one type aircraft was being assembled in the building, the partially completed aircraft would enter from the east and exit to the west. When two different aircraft types were being assembled, one in Building 309 and the other in Building 310, the aircraft would enter and exit through the same door. A security curtain could be drawn between the two buildings to limit access to classified aircraft assembly operations. Final assembly operations performed in Building 309/310 included the installation of the tail sections, wings, landing gear, interior panels and instruments, engines, hydraulic, fuel, and oil lines, and control cables onto an aircraft

fuselage, and the testing of the avionics, landing gear, and hydraulic systems. The loading dock at the south side of the building is used to receive materials for Building 309/310, as well as other buildings at Plant B-6. Aerial photographs from 1948 and 1952 show the presence of dark stains on the asphalt near the east end of the Building 309 dock, in an area that is partly covered by the dock extension that was constructed in 1954.

Testing the avionics and landing gear systems involved the use of portable air conditioning carts and hydraulic power units (putt-putts or hydro-gigs). The air conditioning carts were used to cool the avionics equipment inside the aircraft during testing. Refrigerated air from the air conditioning carts would flow to the aircraft being tested through ducts located in the utility trenches. Air conditioning carts were located outside the north, west, and east walls of the building. The cart outside the north wall was located in a recessed area between columns K13 and K14 of Building 309. The air conditioning carts located outside the west and east walls were not enclosed. The hydro-gigs and putt-putts were used throughout the building to pressurize hydraulic lines, check for aircraft hydraulic line leakage, and check the operation of landing gear assemblies.

Assembly of wing, fuselage, and tail section panels for the L-1011, SR-71 and the F-117A aircraft was conducted in Building 309/310. The assembly process commonly used assembly and manufacturing jigs to form sheet metal and structural components. The component and final assembly processes included the use of solvents, filler compounds, hydraulic fluids, motor oil, glues, resins, and paint. The solvents were used for cleaning; the filler compounds, resins, paint, and glues were used for assembly operations; and the motor oil and hydraulic fluid were used for maintaining hydraulic carts and engines. Specific chemical use areas are described in the Site Inspection section.

The main bulk chemical distribution point for Building 309/310 was formerly located at Building 305, on the north side of Building 304. Fluids were stored in 55-gallon drums at that location. Currently, the bulk chemicals used in the building are stored in the hazardous material storage area west of Building 83. Chemicals are transported from the bulk storage areas to Building 309/310 in 1- to 5-gallon safety cans and, prior to September 1990, were stored in flammable materials storage cabinets that were located throughout the building. The chemicals were then dispensed into small cans or squeeze bottles. By September 1990, the chemicals were stored and dispensed from two chemical storage areas in Building 309/310. For cleaning applications, rags were moistened with solvent. After cleaning, the dirty rags were disposed of in rag containers, and Lockheed maintenance collected the rag containers for disposal off-site. Interviewed Lockheed employees indicated chemicals were used throughout the building and were not confined to any specific areas.

Building 310 contained two metal finishing process lines at columns L6-L9 and L16-L17. Facility drawings indicate the process line at columns L6-L9 was installed in 1954, was inactive between 1955 and 1970, and was reactivated in 1970. In 1976, the process line was removed, and the containment basin and pit were filled with concrete. Facility drawings dated 1954 show the process line at columns L6-L9 included a degreaser, five aboveground tanks, two sand traps, and a boiler. Available information regarding the process line located at columns L16-L17 is very limited. One facility drawing dated 1962 indicated the presence of at least three aboveground tanks at the L16-L17 process line.

Aluminum and perhaps other metal finishing work appears to have been conducted at the iridite/alodine process line at columns L6-L9. The metal finishing operation began by hoisting the metal with an overhead crane and immersing the metal into the degreaser, first into the hot dip chamber and then into the rinse chamber. A boiler supplied steam to heat the degreaser hot dip chamber. From the degreaser, the metal was dipped into each of the five aboveground tanks in an east to west direction. Any overflow from the degreaser and process tanks was directed to the two sand traps, one located at column K7-K8 and the other outside the north wall of Building 310 adjacent to column K8.

Facility drawings dated 1954 show that the five aboveground tanks for the metal finishing line at columns L6-L9 consisted of the following:

- 1) an alkaline tank with an operating temperature of 180-200°F;
- 2) a cold water spray rinse tank;
- 3) an iridite tank with a temperature of 80-90°F;
- 4) a hot water rinse tank with a temperature of 140-180°F; and
- 5) a drier tank with a temperature of 210°F.

A boiler supplied steam to heat tanks 1, 4, and 5, while three small heaters were used to control the temperature in tank 3. The iridite tank had a stainless steel inner lining. In 1970, when the process line was reactivated, the stainless steel lining of tank 3 was removed, tank 4 was sandblasted clean, and tank 5 was lined with fiberglass. The contents of the tanks also changed to the following:

- 1) a hot soap tank;
- 2) a cold water tank;
- 3) an acid deoxidizer tank;

- 4) an alodine (chromic acid mixture) tank; and
- 5) a hot demineralized water rinse tank.

The boiler that supplied steam to heat the tanks and degreaser was located at column K7. The boiler was supplied diesel fuel from the 10,000-gallon underground diesel tank (B-6-F21) located outside Building 310, adjacent to Building 311. The blowdown from the boiler was collected in the underground boiler blowdown tank located in the pit outside Building 310. The blowdown was directed from the tank and pit to the degreaser sand trap located just to the east, which discharged to the storm drain.

The process line at columns L16-L17 included at least three aboveground tanks and may have functioned as a titanium metal finishing process line. A facility drawing dated 1962 identifies two of the three tanks as a drier tank and a tank containing 30% nitric acid and 6% hydrofluoric acid. The tanks were similar in size to the aluminum process line. The third tank was not identified.

The heat treatment facility located at columns K15 and K16 of Building 310 included a furnace, quench tank, and a sand trap. Metal hardening was accomplished by heating the material in the furnace and immediately cooling the metal in a quench water tank located below the furnace. Overflow from the quench tank was pumped into a sand trap and from the sand trap to the storm drain line located outside Building 309/310. Facility drawings indicate the heat treatment facility was removed before 1970 and replaced by a tube brazing room and an air conditioning unit. Information was not available regarding the operations or chemical use associated with the tube brazing room. In 1970, the quench tank pit and the westernmost half of the sand trap were backfilled with sand and covered with concrete. The eastern half of the sand trap was left open to receive condensate from an air conditioner.

Two spray paint booths have been used at Building 309/310. One spray booth was located on the south wall of the building at column M23 in Building 309, and the other booth is located at column M3 in Building 310. Facility drawings dated 1949 show the paint booth in Building 309 as being a water wash unit with discharge directed to a sand trap located outside Building 309, near column N23. A 24-inch diameter duct was shown to direct fumes from the paint booth to the outside of the building. A floor drain was located between the paint booth and the south wall of the building, presumably to drain paint booth overflow to the sand trap. This paint booth has been removed.

Facility drawings dated 1954 show that the paint booth in Building 310 was originally a water wash unit with the liquid discharge directed to an adjacent sand trap and to a sewer line located outside the building. A 42-inch diameter duct vented fumes from the paint booth to the outside of the building. Prior to 1973, the water wash paint booth was changed to a dry filter paint booth permitted by the South Coast Air

Quality Management District, permit number RM45924. The paint booth is currently used for painting small parts. A low temperature paint drying room located at columns M25-M26 in Building 309 is used for drying painted material from the paint booth in Building 310. The drying room was permitted on January 17, 1991 by the South Coast Air Quality Management District, permit number D35339.

The freight elevators were installed in Buildings 309 and 310 when the buildings were constructed in 1944 and 1954. The elevators provide access from the ground floor through the third mezzanine in Building 309 and from the ground floor through the fourth mezzanine in Building 310. Hydraulic pumps are located adjacent to each elevator. A sub-surface concrete-lined pit is located immediately below each elevator. Any oil that may leak from the elevator shaft during elevator operation would collect in the pit.

4.5.3 Previous Investigations

Previous investigations relating to Building 309/310 include 1984 and 1989 underground tank investigations. Tank B-6-F21 was located approximately 20 feet north of Building 310 and just east of Building 311A. This tank is discussed in the section on Building 311. Twelve additional tanks were present at Building 309/310: B-6-F9, -F10, -F11, -F12, -F13, -F14, -F15, -F16, -F17, -F18, -F19, and -F20. A brief discussion of each tank investigation is presented below.

Tank B-6-F9 was an underground diesel tank located outside the southwest corner of Building 309. Gregg and Associates investigated this tank in 1984 during the leak detection program. A 40-foot deep soil boring was drilled south of the tank and sampled at the 5-, 10-, 22-, and 40-foot depths. The laboratory soil sample analysis detected 4 mg/kg TPH at the 10-foot depth, 2.2 mg/kg TPH at the 40-foot depth, and no detectable compounds at the 5- and 22-foot depths (detection limits were not reported). Gregg and Associates attributed the detected hydrocarbons to surface spills. ENSR drilled a 40-foot deep soil boring south of the tank in 1988 and sampled at the 15- and 40-foot depths. The laboratory soil sample analysis for TPH did not detect any hydrocarbons above the 10 mg/kg detection limit. The City of Burbank Fire Department issued ENSR a permit for closure in place of B-6-F9, and the tank was filled with cement.

Tank B-6-F10 was an underground diesel tank located outside the southern exterior of Building 309. Gregg and Associates investigated this tank in 1984 during the leak detection program. A 40-foot deep soil boring was drilled south of the tank and sampled at the 5-, 12-, 22-, 32-, and 40-foot depths. The laboratory soil sample analysis detected 3.7 mg/kg TPH at the 22-foot depth, 2.3 mg/kg TPH at the 32-foot depth, 4.1 mg/kg TPH at the 40-foot depth, and no detectable compounds at the 5- and 12-foot depths (detection limits were not reported). Gregg and Associates attributed the detected hydrocarbons to surface spills. In 1988 and 1989, ENSR drilled three soil borings south and west of the tank: one boring to a depth of 40 feet

and sampled at the 15- and 40-foot depths, one boring to a depth of 41.4 feet and sampled at the 11- and 41-foot depths, and one 41.5-foot deep boring drilled 15° from vertical and sampled at the 5-, 10-, 15-, 20-, 30-, and 40-foot depths. The laboratory soil sample analyses for TPH did not detect any hydrocarbons in any of the samples, with the exception of the 15-foot deep sample in the 40-foot soil boring, which had 2,120 mg/kg TPH (detection limits of 10 mg/kg). ENSR concluded that the vertical extent of contamination is 15 feet with a lateral extent of approximately 5 feet. The City of Burbank Fire Department issued ENSR a permit for closure in place of B-6-F10, and the tank was filled with cement.

Tank B-6-F11 was an underground diesel tank located outside the southeast corner of Building 309. Gregg and Associates investigated this tank in 1984 during the leak detection program. A 40-foot deep soil boring was drilled at the southeast corner of the tank and a soil sample was collected from the drill cuttings. The laboratory soil sample analysis detected 23 mg/kg TPH. Gregg and Associates attributed the detected hydrocarbons to surface spills. In 1988, ENSR drilled a 45-foot deep soil boring at an angle of 22° from vertical to the south of the tank and sampled at the 40- and 45-foot depths. The laboratory soil sample analysis for TPH did not detect any hydrocarbons above the 10 mg/kg detection limit. The City of Burbank Fire Department issued ENSR a permit for closure in place of B-6-F11, and the tank was filled with cement.

Tank B-6-F12 was an underground diesel tank located outside the northwest corner of Building 309. Gregg and Associates investigated this tank in 1984 during the leak detection program. A 40-foot deep soil boring was drilled northwest of the tank and samples collected at the 5-, 10-, 22-, 32-, and 40-foot depths were composited for laboratory analysis. The laboratory soil sample analysis detected 18 mg/kg TPH. Gregg and Associates attributed the detected hydrocarbons to surface spills. ENSR drilled a 40-foot deep soil boring in 1988 to the north of the tank and sampled at the 10- and 40-foot depths. The laboratory soil sample analysis for TPH did not detect any hydrocarbons above the 10 mg/kg detection limit. The City of Burbank Fire Department issued ENSR a permit for closure in place of B-6-F12, and the tank was filled with cement.

Tank B-6-F13 was an underground diesel tank located outside the northern exterior of Building 309. Gregg and Associates investigated this tank in 1984 during the leak detection program. A 30-foot deep soil boring was drilled east of the tank with a solid stem auger, and cuttings were sampled at the 4-, 8.5-, 15-, 22-, and 30-foot depths. The laboratory soil sample analyses detected 170 mg/kg TPH at 8.5 feet, 82 mg/kg TPH at 15 feet, 350 mg/kg TPH at 22 feet, and 490 mg/kg TPH at 30 feet. Gregg and Associates attributed the detected hydrocarbons to leaks from a connecting pipe or from fill tube overflow. ENSR hand augered a nine-foot deep

soil boring in 1989 to the north of the tank and sampled at the nine-foot interval. The laboratory soil sample analysis detected 133 mg/kg TPH. The City of Burbank Fire Department issued ENSR a permit for closure in place of B-6-F13, and the tank was filled with cement.

Tank B-6-F14 was an underground diesel tank located outside the northeast corner of Building 309. Gregg and Associates investigated this tank in 1984 during the leak detection program. An 11-foot deep soil boring was drilled northeast of the tank with a solid stem auger, and cuttings were sampled at the 5- and 8-foot depths. The boring was terminated at 8-feet due to refusal by cobbles. The laboratory soil sample analysis detected 462 mg/kg oil and grease at 5 feet and 2,213 mg/kg oil and grease at 8 feet. Gregg and Associates suggested that the tank may have leaked. ENSR hand augered a 13-foot deep soil boring in 1989 adjacent to the Gregg and Associates boring and sampled at the 13-foot depth. The laboratory soil sample analysis for TPH did not detect any hydrocarbons above the detection limit of 10 mg/kg. ENSR did not confirm the findings of Gregg and Associates, though the two soil borings were close together. The City of Burbank Fire Department issued ENSR a permit for closure in place of B-6-F14, and the tank was filled with cement.

Tank B-6-F15 was an underground diesel tank located outside the southwest corner of Building 310. Gregg and Associates investigated this tank in 1984 during the leak detection program. A 32-foot deep soil boring was drilled south of the tank and sampled at the 5-, 10-, 22-, and 32-foot depths. The laboratory analysis of the 10- and 22-foot samples detected 2.2 mg/kg TPH at the 22-foot depth and showed no detectable hydrocarbons at the 10-foot depth (no detection limit was reported). Gregg and Associates attributed the detected hydrocarbons to surface spills. ENSR drilled a 40-foot deep soil boring southeast of the tank in 1988 and sampled at the 15- and 40-foot depths. The laboratory soil sample analysis for TPH did not detect any hydrocarbons above the 10 mg/kg detection limit. The City of Burbank Fire Department issued ENSR a permit for closure in place of B-6-F15, and the tank was filled with cement.

Tank B-6-F16 was an underground diesel tank located outside the southern exterior of Building 310. Gregg and Associates investigated this tank in 1984 during the leak detection program. A 40-foot deep soil boring was drilled southeast of the tank and sampled at the 5-, 10-, 20-, 32-, and 40-foot depths. The 10- and 20-foot deep soil samples were analyzed for diesel fuel, Stoddard solvent, VOCs, and pesticides, based on odors noted in the field. A composite sample was analyzed for TPH. The laboratory analysis of the 10- and 20-foot samples did not detect any VOCs above the 0.1 to 0.5 $\mu\text{g}/\text{kg}$ detection limits. Diesel fuel, stoddard solvent, and pesticide results were not reported by Gregg and Associates. The composite sample contained 3.8 mg/kg TPH. Gregg and Associates attributed the detected hydrocarbons to surface spills. In 1988, ENSR drilled a 40-foot deep soil boring southeast of the tank and sampled at the 13- and 40-foot depths. The laboratory soil sample analysis for TPH detected 31 mg/kg in the 13-foot deep sample and no hydrocarbons above the

10 mg/kg detection limit in the 40-foot sample. The City of Burbank Fire Department issued ENSR a permit for closure in place of B-6-F16 in 1989, and the tank was filled with cement.

Tank B-6-F17 was an underground diesel tank located outside the southeast corner of Building 310. Gregg and Associates investigated this tank in 1984 during the leak detection program. A 40-foot deep soil boring was drilled south of the tank and sampled at the 10-, 15-, 20-, 30-, and 40-foot depths. The laboratory soil sample analysis for TPH detected 3 mg/kg in the 20-foot deep sample and no detectable hydrocarbons in the other samples (no detection limit was reported). The 10-foot deep sample results were not reported. Gregg and Associates reported that low levels of four alcohols and ketones were detected at a depth of 15 feet. The concentration levels detected ranged from a low of 1.3 mg/kg of MEK to a high of 5.8 mg/kg of butyl alcohol. Gregg and Associates attributed the detected hydrocarbons to surface spills. ENSR drilled a 40-foot deep soil boring southwest of the tank in 1988 and sampled at the 15- and 40-foot depths. The laboratory soil sample analysis for TPH detected no hydrocarbons above the 10 mg/kg detection limit. The City of Burbank Fire Department issued ENSR a permit for closure in place of B-6-F17 in 1989, and the tank was filled with cement.

Tank B-6-F18 was an underground diesel tank located outside the northwest corner of Building 310. Gregg and Associates investigated this tank in 1984 during the leak detection program. An eight-foot deep soil boring was drilled northwest of the tank with a solid stem auger, and cuttings were sampled at the five- and eight-foot depths. The boring was terminated at a depth of eight feet due to refusal by cobbles. The laboratory soil sample analysis detected 119 mg/kg oil and grease at five feet and 993 mg/kg oil and grease at eight feet. Gregg and Associates suggested that the tank may have leaked. ENSR hand augered a soil boring northeast of the tank in 1989 and sampled at a depth of eight feet. The laboratory soil sample analysis for TPH did not detect any hydrocarbons above the detection limit of 10 mg/kg. ENSR did not confirm the findings of Gregg and Associates. The City of Burbank Fire Department issued ENSR a permit for closure in place of B-6-F18, and the tank was filled with cement.

Tank B-6-F19 was an underground diesel tank located outside the northern exterior of Building 310. Gregg and Associates investigated this tank in 1984 during the leak detection program. A 30-foot deep soil boring was drilled northeast of the tank and sampled at the 5-, 10-, 15-, 20-, and 30-foot depths. The samples were composited, and the laboratory analysis for TPH did not detect hydrocarbons in the sample (the detection limit was not reported). ENSR drilled a 40-foot deep soil boring east of the tank in 1989 and sampled at the 15- and 40-foot depths. The laboratory soil sample analysis for TPH detected no hydrocarbons above the 10 mg/kg detection limit. The City of Burbank Fire Department issued ENSR a permit for closure in place of B-6-F19 in 1989, and the tank was filled with cement.

Tank B-6-F20 was an underground diesel tank located outside the northeast corner of Building 310. Gregg and Associates investigated this tank in 1984 during the leak detection program. A 40-foot deep soil boring was drilled northwest of the tank and sampled at the 5-, 10-, 22-, 30-, and 40-foot depths. The samples were composited and the laboratory analysis detected 14 mg/kg TPH in the sample. Gregg and Associates attributed the detected hydrocarbons to surface spills and other surface sources. ENSR drilled a 40-foot deep soil boring northeast of the tank in 1988 and sampled at the 15- and 40-foot depths. The laboratory soil sample analysis for TPH detected no hydrocarbons above the 10 mg/kg detection limit. The City of Burbank Fire Department issued ENSR a permit for closure in place of B-6-F20 in 1989, and the tank was filled with cement.

4.5.4 Site Inspection

A site inspection was performed of the interior and exterior of Building 309/310. A description of the features observed during the site inspection is presented below.

4.5.4.1 Interior

The primary use of Building 309/310 at the time of inspection was for storage and for component assembly for the F-117A aircraft. The hangar area is currently used for jig storage, component assembly, and machining. Operations in Building 309/310 are currently being transferred to Lockheed's Palmdale facility.

A representative number of the approximately 300 utility pits in Building 309/310 and representative portions of the utility trenches were inspected. Staining was not evident in the inspected utility pits or trenches. The concrete floor in the hangar area was in good condition with no evidence of significant cracking or staining.

The mezzanines contain vacant rooms, offices, dry-parts storage areas, electronics testing facilities, and a photography lab. The offices contain desks, file cabinets, computers, and other office furnishings. Linoleum floor tile or carpeting cover the floors. The ceilings have suspended ceiling tiles with fluorescent light fixtures. Electronics testing facilities are located at the southeastern portion of Building 310 adjacent to columns M27-M30. Electronics testing machines and equipment were present; no evidence of staining or chemical use was observed. The photography lab is located on the third mezzanine in Building 309 and conducts small-scale black and white negative film processing. The film developer chemicals are stored in the chemical storage area on the ground floor of Building 309, and waste chemicals are placed in sealed containers for collection and off-site disposal. The photography lab contains a stainless steel service sink that is tarnished and stained. Interviewed employees indicated that no chemicals are disposed of in the sink. No other evidence of staining was present.

The machining area, located at the southeastern portion of Building 310, contains drill presses, grinders, band saws, shears, work tables and desks. Oil and oil absorbent material is present on the floor around the metal shears. Two very large drill presses are located at column 23. Cutting oil and minor amounts of metal shavings were noted on the concrete floor in the vicinity of these drill presses and in two nearby utility pits. The soil bottoms in the two utility pits are stained with oil. Oily absorbent material was noted on the concrete floor at the southernmost drill press. Minor amounts of IPA, MEK, and MIBK are used in the machining area.

The two chemical storage areas for Building 309/310 are located along the building centerline: storage crib no. 1 in Building 310 and storage crib no. 2 in Building 309. Three flammable materials storage cabinets are located within chemical storage crib no. 1. One- and five-gallon cans and spray bottles containing flammables are present in the cabinets. Chemicals in these cabinets include MIBK, naphtha, IPA, filler compounds, motor oil, MEK, xylene, epoxies, glues, resins, layout fluid, and paint. Chemical storage crib no. 2 contains three hazardous materials storage cabinets, two acid storage cabinets and numerous one- and five-gallon safety cans for flammable liquids. No staining was evident within the chemical storage cribs.

Evidence of the former metal finishing process line at columns L6-L9 of Building 310 is visible as a patch in the concrete floor. The northern half of the sand trap that received spilled fluids from the aboveground tanks is present. The other half of the sand trap is filled with concrete. The sand trap inlet and outlet pipes are slightly rusted and dried soil is present in the sand trap bottom. The open portion of the sand trap measures 2 feet by 3 feet by 4 feet deep. The concrete lining of the sand trap is in good condition, with no staining noted.

East of the former process line at column L9, there are two concrete-lined pits that measure 3 feet by 3 feet by 3 feet deep. The purpose of these pits is unknown. Each pit contains a metal plate bolted onto an inside wall. The southernmost pit contains a minor amount of soil, and the metal plate is attached to the south wall of the pit. The northernmost pit contains approximately 1 foot of dry soil, and the metal plate is attached to the north wall of the pit. The two pits are located at two corners of a large concrete patch located between columns L9 and L10. The concrete in both pits appears to be in good condition, with no evidence of staining. A concrete-filled trench is present between the northern wall of Building 310 and the northern pit. The trench contains a clean-out or access plug which is currently filled with concrete. Facility personnel were not aware of the reason for the pits, former trench, or the concrete patch, and facility drawings did not identify their purpose.

Evidence of the former metal finishing process line at columns L16-L17 was not visible at the time of inspection. An air conditioning unit currently covers the area of the former process line.

The former location of the heat treatment facility at column K16 in Building 310 is currently occupied by a vacant room with linoleum floor tiles, acoustic tile ceiling, and fluorescent lights. The outline of the former quench tank is visible through the linoleum floor tiles. The remaining portion of the heat treatment facility is covered by an air conditioning unit in an adjacent room. Beneath the air conditioning unit is the sand trap for the former quench tank. A concrete patch covers the west half of the sand trap, while the east half is full of condensate water which discharges to the sand trap from the air conditioner condensate line. The steel plate cover on the sand trap was not able to be moved to fully inspect the sand trap interior. No staining is present in the vicinity of the air conditioner or sand trap.

The area of the former paint booth on the south wall of Building 309 is currently occupied by an empty room constructed with wood-frame and sheetrock wall panels. Evidence of the former paint booth is not visible within the empty room. Interviewed Lockheed employees could not recall the presence of the paint booth or how long it may have been in operation. Evidence of the former paint booth was, however, noted outside the building along the brick wall and loading dock. The brick wall has three small patches, a 1-inch pipe with a downward-facing elbow connection, and a 2-inch diameter pipe that exits the wall and runs down into the concrete floor of the loading dock. These pipes and patches are located on the wall immediately south of the former paint booth, and it is likely that one of these features is the former drain line from the paint booth water wash reservoir. A two-stage concrete-lined sand trap is present adjacent to the brick wall, and it appears that this sand trap received overflow or drain water from the former paint booth. The sand trap, which measures 2 feet by 4 feet by 2 feet deep, has a rusted, 6-inch diameter outlet pipe. An inlet pipe was not visible at the time of inspection. The concrete is in good condition, with no evidence of staining.

The paint booth on the south wall of Building 310 contains three flammable material storage cabinets, which contained paints, coatings, and thinners in gallon and quart cans, and a hazardous waste storage cabinet, which contained several 15-gallon and 30-gallon drums for waste paint. Chemicals commonly used at the paint booth include IPA, MEK, naphtha, and MIBK, in addition to the paints. A service sink is located next to the wall, adjacent to the paint booth. No significant staining was noted in the sink. The concrete floor of the paint booth is in good condition, but is heavily stained from paint. The paint booth sand trap, located at column N3, is full of water, perhaps from the adjacent service sink.

The paint drying room on the south wall of Building 309 is enclosed by sheetrock walls and contains metal shelving. The concrete floor is in good condition with no evidence of staining

As described previously, two electrical substations are located adjacent to the north wall and three are located adjacent to the south wall of Building 309/310. The 112½-kVA transformer in the Building 310 north wall substation was recently

replaced with a 300-kVA unit. The transformers within the substations are dry-type air-cooled units and are not of the type that contain polychlorinated biphenyls (PCBs). The 100-kVA transformer located in the Building 309 north wall substation is out of service and has an attached label indicating the unit has PCB-containing materials. Lockheed records indicate the oil switches in this transformer that contained PCBs have been removed. No staining is present at the substations, except for very minor amounts of a tar-like substance that are present on the floor of the northern substation in Building 310 and on the floor of the easternmost substation adjacent to the south wall of Building 310. The rafter-mounted transformers in Building 309/310 are dry-type air-cooled units.

The elevator pits beneath the four elevators in the building are heavily stained with oil. In the bottom of each elevator pit an approximately 1-foot diameter opening is present. Elevator maintenance personnel suggested the openings were connected to the sewer line and allowed water and excess oil to drain out of the elevator pit; however, it is not unlikely that the holes drain to native soil below the elevator pits. The areas surrounding the hydraulic pumps adjacent to the elevators have no evidence of staining.

The twelve furnaces in Building 309/310 are currently fueled by natural gas. Very minor amounts of lubricating oil from the fan motor units have dripped onto the heaters. Very minor oil drips or staining was noted on the concrete floors at a few of the furnaces.

Exterior

Items of interest that were inspected outside of Building 309/310 include the 12 underground diesel tank sites, air conditioning carts, the loading dock, the degreaser sand trap, the boiler blowdown pit, the air conditioning units, emergency generators, and a concrete storm drain trench. Each of these items is discussed below. The area around Building 309/310 is paved with asphalt and is in good condition.

The 12 underground diesel tanks have been abandoned in place by filling them with concrete. The supply and vent lines of the tanks are disconnected a few inches above grade and filled with cement. Asphalt or concrete patches cover the locations of the soil borings that were drilled adjacent to the tanks. A 1-foot square concrete-lined dip stick pit at former Tank B-6-F19 contains oil-stained soil. A 2-inch metal pipe located in the center of the pit contained 3 inches of oil when first inspected, but was empty on a subsequent inspection. No other oil or staining was visible at the remaining tank locations.

The air conditioning cart locations outside Building 309/310 contain subsurface air conditioning duct and electrical fittings. The air conditioning cart that was stationed outside the west side of Building 309 is no longer present. A pit at that location

contains the duct served by the former air conditioning cart. There is no evidence of staining in the pit or on the surrounding asphalt. The air conditioning cart enclosure outside the north wall of Building 309 has acoustic walls and ceiling, and a concrete floor; no air conditioning cart was present at the time of inspection. Minor staining was noted on the concrete at the northeast and northwest corners of the enclosure. At the time of inspection, the air conditioning cart located adjacent to the east wall of Building 310 was connected to the subsurface duct with a 10- to 12-inch diameter flexible duct. No staining was noted in the area of the air conditioning cart outside the east wall of Building 310.

Two skid-mounted metal trailers and a 125-kVA mobile power unit are located adjacent to the air conditioning cart outside the east wall of Building 310. The trailers are 8 feet wide by 20 feet long and may have contained electronics equipment. One trailer was located on a pre-existing 22-foot square concrete pad while the other was on asphalt paving. The mobile power unit appeared to supply power to the trailers. No staining was noted adjacent to the trailers, air conditioning cart, or mobile power unit.

The loading dock on the south side of the building is covered with a metal awning on the western portion adjacent to Building 309. The dock has an employee eating area, vending machines, and telephones. The sand trap that was associated with the former paint booth in Building 309 is present on the loading dock. A description of the condition of the sand trap at the time of site inspection is presented above in the discussion of the former paint booth site inspection. A water valve pit is located on the dock outside column N3 in Building 310, adjacent to tank B-6-F15. The valve pit is approximately 2 feet by 2 feet by 2 feet deep, with concrete walls and a soil bottom. Compressed gas cylinders are temporarily stored on the central portion of the dock prior to being distributed to other buildings at Plant B-6. The concrete loading dock is in good condition. Immediately south of the western end of the loading dock is a covered parking area. Factory Transportation parks forklifts and cranes in this covered parking area. The asphalt surface beneath the parked vehicles has moderate to heavy oil staining.

The degreaser sand trap and boiler blowdown pit associated with the iridite/alodine process line are visible outside the north wall of Building 310, adjacent to columns K6-K9. The concrete walls and bottom of the sand trap are in good condition with no evidence of staining. The boiler blowdown pit is approximately 4 feet square and has a steel plate cover. The steel plate cover could not be removed to allow inspection of the pit. A 2- to 3-inch diameter iron pipe was noted adjacent to the boiler blowdown pit outside column K7. The pipe may be the former vent pipe for tank B-6-F21. A 12-foot long section of the brick wall at column K8 has been replaced. Interviewed Lockheed employees could not recall the reason for the brick wall being replaced or patched.

The four air conditioners outside the north wall of Building 309 are wall units mounted on metal frames, approximately 6 feet above grade. Three of the four air conditioning units along the north wall of Building 310 are bolted to a concrete slab outside columns K19-K20. The fourth air conditioner is mounted on a concrete slab outside column K23. No staining is evident below or adjacent to these air conditioning units. The air conditioners outside the south wall of Building 309/310 include one wall-mounted unit and two surface-mounted units. The wall-mounted unit, located outside of Building 309 at column N13-N14, had no staining present at the time of inspection. The other two units, located outside Building 310 at columns N16 and N19-N21, are mounted onto concrete pads. The concrete slabs are in good condition, with no visible cracks. Three small pump motors are attached to the air conditioners: one on the air conditioner located outside columns N19-N21 and two on the air conditioner located outside column N16. Minor oil staining is visible underneath each motor.

A two-foot square concrete-lined pit with a steel plate cover was noted east of the loading dock outside Building 310 at column N15. Four condensate pipes from the adjacent air conditioner direct condensate into the pit. The pit was full of water at the time of inspection.

Two emergency generators are located outside the south wall of Building 309/310. The generators have internal diesel tanks to supply fuel to power the generator. The generators are mounted on concrete pads and have grounding rod pits adjacent to them for grounding the equipment. Minor staining is visible on the concrete pad adjacent to the east side of the generator near columns N19-N20 of Building 309. No staining is visible around the generator located adjacent to Building 310 near column N17.

An inactive baghouse is located outside the south wall of Building 310 at column N17. Interviewed Lockheed employees could not recall its use, but these units typically served dust collection systems from wood shops.

Two dry-type air-cooled 75-kVA transformers were noted outside the south wall of Building 310, adjacent to column N18. The transformers are located on a concrete slab, and no staining is visible around the transformers.

Outside the west side of Building 309 is a concrete-lined drainage trench covered with a steel grate. The trench intercepts surface runoff from the yard area to the west and northwest. The trench begins at the northwest corner of Building 309 and terminates at the southwest corner of the building, where it discharges into a below grade storm drain line. No evidence of staining in the trench was present at the time of inspection.

4.6 BUILDING 311

Building 311 is located in the southern portion of Parcel 2, just north of Buildings 309/310 (see Figure 4-1). Building 311 was constructed in 1962 as an engineering building. An addition (311A) was added to the east end of the building in approximately 1964. Another addition (311B) was added east of 311A in approximately 1979. In 1984 a temporary one story building (311T) was added to the west end of Building 311. 311T is now an essentially permanent structure. Building 311T is also known as Building 311C. Building 311 and its additions are known collectively as Building 311. Figure 4-11 presents a plot plan for Building 311.

Information on the historical and recent operations at Building 311 was obtained through interviews and site inspections with the following current and former Lockheed personnel: Mr. Don Ayles, Ms. Gayle Miller, Mr. William Robinson, Mr. Rowett, and Mr. Bill Smith.

4.6.1 Construction Details

Buildings 311, 311A, and 311B are similarly constructed with concrete walls and floors. Buildings 311 and 311A are two stories high and Building 311B is one story. A basement is located in the eastern portion of Building 311A. As originally constructed, Building 311 had engineering office space on both floors of most of the building. A mock-up area that was located in the western end of Building 311 was open from the floor to the roof (the area is defined by columns B1 to J4 on a 1962 drawing). A large, roll-up door was located in the western end of the building for access to the mock-up area. A photography laboratory was constructed in the southwest corner of the second floor. Sinks and drains from this lab were connected to the sanitary sewer line that is located south of the building. A 1978 drawing indicates that a second floor addition was constructed over the former mock-up area and that an elevator was installed at the northwest corner of the building. This drawing also indicates a depressed area (10-foot by 14-foot) in the southwest corner of Building 311, where a dumb-waiter that served the photography laboratory was located. Building 311T comprises 16 adjacent 12-foot by 60-foot modular, steel and wood frame office units. Building 311T was constructed on top of a concrete pad that was formerly used as a wash rack. The wash rack is discussed further in the Previous Operations and Present Use section.

Roof penthouses (mechanical rooms) on Buildings 311 and 311A each contain a boiler, a water chiller, a cooling tower, and two air conditioning units. The 10,000-gallon steel underground fuel oil tank (B-6-F21) that supplied the boilers was moved east in 1979 to near the present location of Building 312 to make way for the Building 311B addition. This tank was removed in 1989. The boilers have been fueled by natural gas since that time.

An additional chiller is indicated on a 1971 drawing, on the east side of Building 311A. A large (approximately 8-foot diameter) drain sump associated with this chiller is shown at the southwest outside corner of Building 311A. However, facility personnel have indicated that this chiller and the associated sump were never installed.

At the foot of the Building 311A basement stairs, there is a 4-foot diameter concrete-lined sump that formerly collected rain water, which in the past could come down the stairs. Prior to the construction of Building 311B, the stairs were on the outside of the building and were thus exposed to the weather. A pump in the sump was used to remove the water and discharge it to the asphalt pavement outside of the building. The sump became unnecessary when Building 311B was added.

A 1968 document identifies a 750-kVA electrical substation at Building 311; it is identified as a dry, air cooled unit with 3-phase transformer; its location is not given, but it is likely that it was located in the transformer room in the basement of Building 311A. A 1984 drawing identifies a 1,000-kVA substation at the building. This transformer is located in the southeast corner of the basement of Building 311A. The transformer unit does not contain PCBs.

4.6.2 Previous Operations and Present Use

Prior to the construction of Building 311, the area was used for parking, fueling, and maintaining aircraft. The eastern end of an east-west trending blast fence, identified as blast fence S1 in the Plant B-6, Parcel 1 Environmental Assessment (McLaren/Hart, 1991), was located at the present location of Building 311T. An extension of the blast fence that trended northeast-southwest had its southwestern terminus at the current location of Building 311T, adjacent to the eastern end of the east-west blast fence. Aerial photographs from 1945 show a firing tube that was used to test aircraft guns at the present location of Building 311. Three bomb shelters were located at the current location of Building 311A. Aerial photographs from 1954 show that the firing tube had been removed and showed staining around parked aircraft in that location. These 1954 photographs also show the construction of the wash rack at the present location of Building 311T. The aircraft wash rack was in operation for a very short time before it was converted to a final assembly area for Constellation aircraft. Final assembly of Constellations was discontinued at the wash rack area by the late 1950s. In the 1960s, the wash rack area was used for aircraft inspection and storage. By 1968, the former wash rack was used as a Lockheed employee parking lot. A small building, designated Building 315, was located adjacent to the blast fence in the present location of Building 311T. A 1961 aerial photograph shows a covered aircraft stall at the location of the former firing tube.

Since its construction in 1962, Building 311 has been principally used as engineering offices for LADC. In addition to personnel office space, the building has contained a photography laboratory and blueprint room in the southwest corner of the second floor of Building 311, a large drafting area on the second floor of Building 311A, and computers in the basement of Building 311A and in Building 311B.

As previously mentioned, the northwestern portion of Building 311 housed a mock-up shop until sometime before 1978. The mock-up shop was reportedly used for construction and display of one-half and three-quarter scale aircraft models. The models were constructed of wood and plaster.

The photography laboratory on the second floor in the southwest corner of Building 311 had been in operation since the building's construction. The laboratory has been used for developing 70-mm high speed black and white film and for other photographic operations. The photography laboratory used film developing chemicals associated with black and white photography. These chemicals included acidic and alkaline developing and stopping fluids and photographic salts, primarily silver salts. Used photography chemicals were typically disposed to the sewer through the laboratory sink drains or were drummed and disposed as hazardous waste. For the most part, fluids disposed to the sewer were rinse waters and other diluted solutions. Film developing ceased in the laboratory in 1986. From 1985 to 1986 film was developed in a self-contained developing unit within the laboratory. The film has been developed at other Lockheed facilities off of Plant B-6 since 1986. The laboratory originally covered the area from columns A1 to B2 and was expanded at some point in time to encompass the area from column A1 to B4.

Immediately to the east of the photography lab there was an ozalid (blueprint) room. The blueprint facility is no longer located in Building 311. The ozalid room initially was located between columns A2 and B4, but was moved immediately east when the photography laboratory expanded to cover that area. Ammonia gas was piped into the ozalid room from storage cylinders that were located outside of the building near column A2.

4.6.3 Previous Investigations

In 1979, Tank B-6-F21 was moved approximately 150 feet east from a location near the south side of what is now Building 311B to near the southeast end of Building 312. In 1984, Gregg and Associates drilled two soil borings, which were completed as vapor monitor wells, north and northeast of the tank to a depth of 14 feet. Soil samples were collected from the solid-stem auger cuttings and analyzed for TPH and VOCs. The soil sample collected from the boring drilled at the northeast corner of the tank contained no VOCs and 37 mg/kg TPH. The soil sample collected from the boring drilled north of the tank contained 19.5 $\mu\text{g}/\text{kg}$ methylene chloride, 3.1 $\mu\text{g}/\text{kg}$ TCA, 1.3 $\mu\text{g}/\text{kg}$ TCE, 10.4 $\mu\text{g}/\text{kg}$ chloroform, and 109 mg/kg TPH.

In 1988, ENSR drilled a 40-foot soil boring approximately 10 feet north of the eastern end of the tank, collected samples at the 15- and 40-foot depths, and analyzed the samples for TPH and BTEX. No TPH or BTEX were detected in the samples. ENSR installed four vapor probes around the tank to a depth of three feet and detected trace levels of hydrocarbons with a portable gas chromatograph. ENSR attributed these readings to surface spills and recommended no further investigation. In 1989, the tank was removed and properly disposed of by Jones Construction. Two soil samples that were taken from the tank excavation had no detectable TPH or BTEX.

4.6.4 Site Inspection

4.6.4.1 Building Interior

Inspection of the former mock-up area, which is currently office space, and other office space in Buildings 311 and 311A showed the floors are covered in vinyl floor tiles, the ceilings are covered with acoustical tiles, and lighting is provided by fluorescent fixtures. Because of access limitations due to security restrictions, only a small area of the office space within the building was inspected. No staining or evidence of chemical use were observed in the inspected office areas of Buildings 311 and 311A. Facility personnel indicated that the office areas that were inspected were typical of the rest of the building. Building 311B reportedly contains mainframe computer equipment in the northwestern corner of the building, personal computer stations in the center, and programmer's offices in the southern portion of the building. A paper supply room is located in the southeastern corner of Building 311B. Due to security restrictions, the Building 311B interior was not inspected. Based on the stated use of the building, there does not appear to be a significant likelihood for chemical contamination of the soil from operations inside of the building. Building 311T contains office space with desks, file cabinets, and computers. No staining or chemical use was observed in the building.

The bottom of the elevator pit that is located on the western end of Building 311 is covered with an oily stain, and oily staining is visible approximately six inches up the walls of the pit. The elevator pump room is located just east of the elevator. The room has a bare concrete floor, and minor oil staining is present.

In the photography laboratory, which is located on the second floor in the southwestern corner of Building 311, there are four dark rooms, a chemical mixing and storage room for black and white photography chemicals, a former motion picture processing room, two washing and drying rooms, a film storage room, and a file room. Sinks are located in the wash and dry rooms and the former motion picture processing room. The area around the sink drain pipes has black and white staining and powdered chemical residues. Facility personnel reported that there have been problems with the drains becoming clogged. Waste solutions were drummed for off-site disposal when sink drains were clogged. On the south side of the

laboratory, in the former motion picture cleaning and drying area, there are floor stains and the floor tiles appear degraded. The former chemical mixing and storage room was not in use and no staining was visible.

The transformer room, located in the southeast corner of the basement in Building 311A, contains a 750/1,000-kVA dual rating dry-type transformer, an 150-kVA dry-type transformer for Building 311B, electrical switching gear, and air conditioning units for room cooling. No staining was observed in the transformer room.

4.6.4.2 Building Exterior

A covered ramp at the extreme northwestern corner of Building 311 allows access to the building elevator. A grated trench at the base of this ramp collects stormwater and discharges it to the pavement under Building 311T.

A 75-foot long catch basin is located in front of the Building 311 lobby on the north side of the building to collect stormwater runoff. This catch basin and other catch basins along the north side of Building 311 discharge to the storm drain line that runs along the north and east sides of the building.

On the eastern exterior of Building 311B there is a fenced enclosure that contains air conditioning/air handling equipment for 311B. There is moderate staining around the northern air conditioning unit compressor and very minor staining around the southern compressor. At the time of the site inspection, there were six one-gallon containers of "degreasing solvent" (one of which had been opened) adjacent to one of the air conditioning units. The label indicated the solvent contained mineral spirits and chlorinated hydrocarbons. Outside of the fenced enclosure there was a full 55-gallon drum labeled "waste liquid, N.O.S. ORM-E, 9189." This numerical identification denotes waste liquids or solids and does not specify a particular source or composition.

Also along the eastern wall is a mechanical room that contains an air handling unit, two 400-cycle motor generators, a chilled water pump, and associated switch gear and electrical control panels. A blow-down drain is located adjacent to the air handling unit. Minor corrosion was observed on the pump fittings. No other staining was observed in the room. The room is lighted by fluorescent fixtures.

An emergency generator is located outside of the southeastern corner of Building 311B. The generator provides emergency power to the computers in Building 311B and has an integral fuel tank. The area around the generator is clean, with no staining. A static ground rod is located in an 8-inch diameter pit adjacent

to the generator. The concrete surface around this small pit is slightly raised to prevent surface runoff from entering the pit. A 55-gallon drum containing approximately 10 gallons of diesel fuel for the generator was located within the fenced generator enclosure.

There is evidence in the asphalt of five former diesel fuel tanks along the northern wall of Building 309, south of Building 311. These tanks were filled in place by ENSR in 1989. Soil borings were conducted at each tank and the data is summarized in the Previous Investigations section of the Building 309/310 discussion. Tank appurtenances associated with former tank B-6-F19 are observable approximately 13 feet south of the southeastern corner of Building 311. At this location a 10-inch by 10-inch grate covers a 2-inch diameter pipe that contains about 4 inches of diesel fuel; presumably, this is the dip stick tube for the former tank.

A patch in the asphalt is visible approximately 75 feet east of Building 311B and immediately south of Building 312, where the 10,000-gallon underground storage tank (B-6-F21) for the Building 311 boilers and a boiler in Building 310 was formerly located. A soil vapor monitoring well for this tank is visible southeast of Building 312 near the edge of the asphalt patch.

A utility patch approximately 25 feet west of the southeast corner of the building reportedly covers communication lines between Buildings 311B and 309/310. On the southern wall of the building, at the point where Buildings 311A and 311B meet, the fuel lines and pump that used to feed the boilers on the roof are still in place, but not in use. A cooling tower and large vent for the electrical equipment room in the basement of Building 311A are located outside of the southeast corner of Building 311A. Cooling tower overflow is discharged to a storm drain catch basin under the tower. No staining is visible near the cooling tower, vent, or abandoned boiler fuel pump.

A 2-foot by 3-foot asphalt patch partially covers a sunken area under the pedestrian ramp near column A15. It appears that soil has piped out from under the asphalt, potentially by a leaking underground storm drain.

Catch basins for the storm drain are located along the south side of the building, approximately at columns 1 (approximately 20-feet long) and at columns 5, 7, 9, 12, and 14 (approximately 1-foot square). Chillers at columns 8 and 9 have condensate lines that discharge to nearby catch basins. The chiller at column 8 and an adjacent water treatment unit, including a small natural gas-fired boiler, service Building 309. All water treatment chemicals for cooling towers and chillers on the plant are handled by a contractor, ChemPro. Water treatment chemicals currently used may include sodium bisulfide, sulfamic acid, polyacrylate, organophosphonate, quaternary amines, and chlorine.

A former flammable drum storage area (approximately 5-foot by 8-foot) is located at column A5. This storage area is immediately adjacent to a storm drain catch basin that would likely receive any spilled fluids. No additional information on the use of this area was available. The area is partially enclosed by a fence, and there are static ground cables mounted on the building wall of the enclosure. No staining is visible.

Between column A3 and A4 there is evidence of a former ammonia gas bottle storage area against the wall. Piping on the wall at this location formerly delivered the ammonia to the reproduction room on the second floor. An air line present on the wall between columns A2 and A3 also appears to go to the reproduction room.

Two 10-inch diameter PVC pipes that carry storm water runoff from under Building 311T terminate approximately 20 to 30 feet west of the western edge of Building 311. Discharge from these pipes flows across the asphalt to the storm drain trench/catch basin near the southwestern corner of Building 311.

Approximately 8 feet south of Building 311T and 50 feet west of the western edge of Building 311 is a four compartment settling basin/sand trap/clarifier that is covered with a steel mesh grate. The settling basin received discharge from a drain trench at the former wash rack that was located where Building 311T is now. The settling basin appears to discharge to the storm drain. Small gaps were noted in the concrete joints in the western end of the settling basin which would have allowed some discharge of liquids from the basin to the underlying soil. No staining is visible in the settling basin. A 2-inch diameter galvanized iron pipe (capped above grade), of unknown purpose, is located approximately two feet north of the settling basin. Remnants of the grated trench that was located at the wash rack are visible. The trench is filled with concrete.

Approximately 60 feet west of the western corner of Building 311 and approximately 20 feet south of Building 311T there are several steel plates and manhole covers over fire main valves, domestic water valves, communications lines, and the sewer.

Numerous electrical conduits, small dry-type transformers, and water lines are located on the walls of Building 311T to service the building and small air conditioning units that are located on the roof. Approximately ten air conditioning units are visible.

The roof penthouses above Buildings 311 and 311A each contain a cooling tower, chiller, condensate tank, pump, natural gas boiler, and two air handling units. The boilers were formerly fueled by fuel oil from an underground tank and are now fueled by natural gas. The western penthouse also contains two hot water heaters for the photography laboratory. Floor drains are located adjacent to each piece of

equipment except the air handling units. Some corrosion was observed on the wall around the cooling tower in the western penthouse, and minor corrosion was visible on the air handling units in both penthouses. No other staining was observed on the roof. The roofs of Buildings 311, 311A, and 311B have a silver-colored coating.

4.7 BUILDINGS 312, 313, and 315

Buildings 312, 313, and 315 are located in the southern portion of Plant B-6, Parcel 2, just east of Building 311 (see Figure 4-1). Building 312 was constructed in 1983 for the Document Destruct System (DDS). Building 313 is a shed that is used for paper storage. Building 315 is also known as the Cafe and is the primary eating facility on the Plant B-6 site. Figure 4-12 presents a plot plan of these buildings.

Information on the operations at Buildings 312, 313, and 315 was obtained through interviews and site walks with Mr. Richard Hall, Ms. Laura Maldonado, Ms. Gayle Miller, and Mr. Harley Waggoner.

The following discussion of Buildings 312, 313, and 315 is divided into construction details, previous operations and present use, and site inspection.

4.7.1 Construction Details

4.7.1.1 Building 312

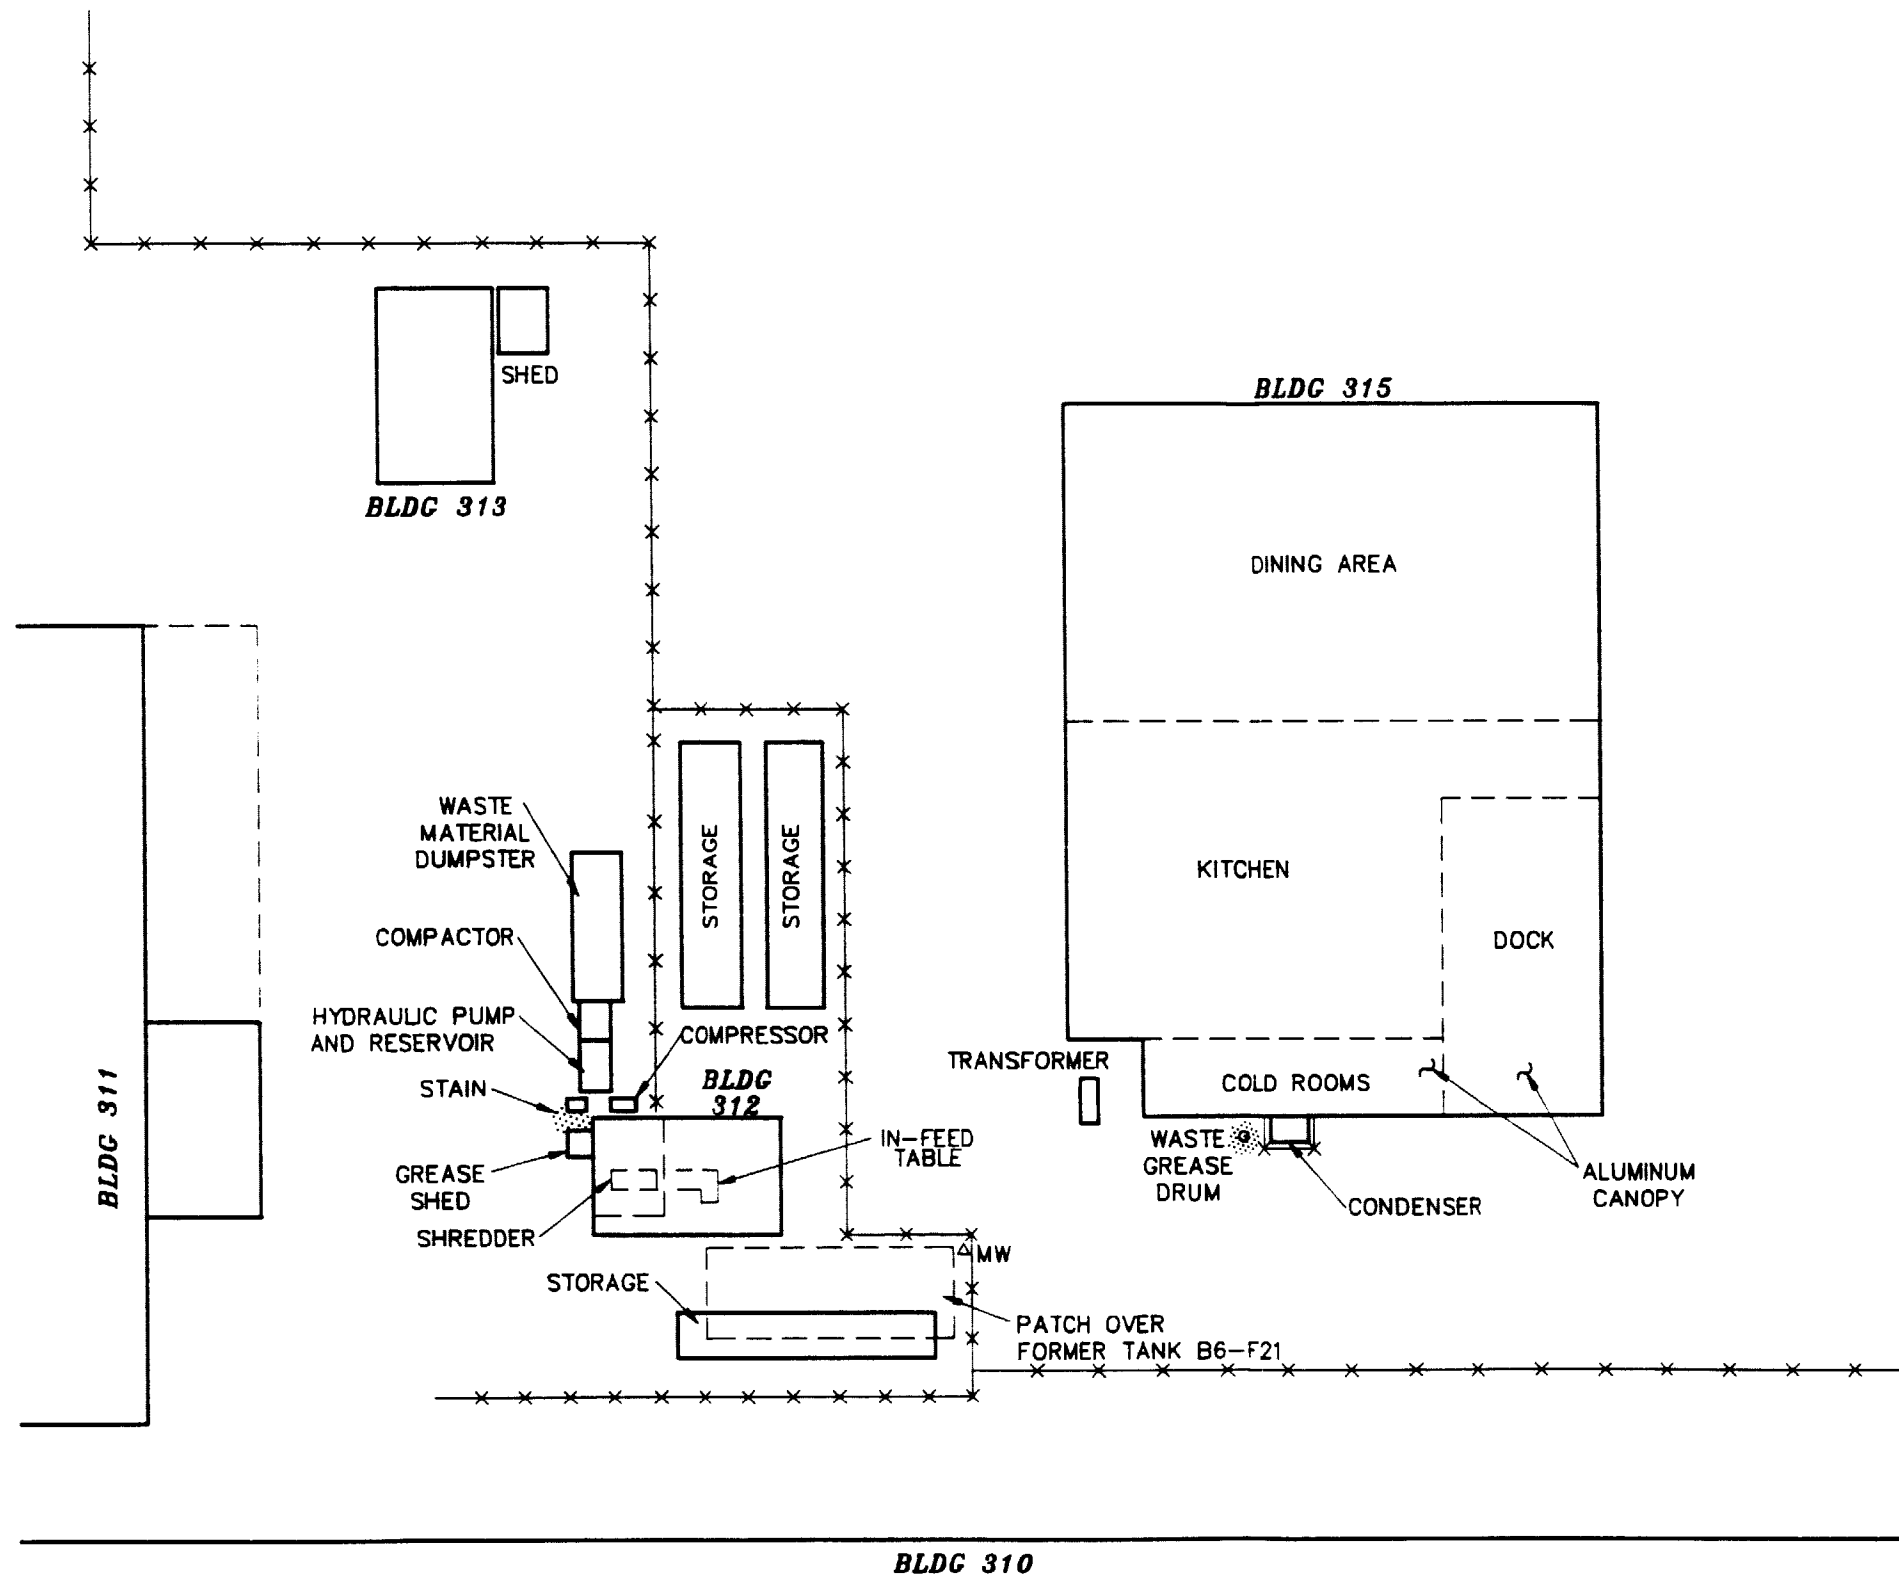

Building 312 is an 18-foot by 30-foot metal-framed and metal-covered pre-engineered building. Three document storage containers are located adjacent to the building, as is a dust collector, compactor, and waste storage dumpster. The building sits on a concrete slab, as does the dust collector, compactor and waste storage dumpster. Water and power are supplied to the building through underground utilities. The area surrounding the building is paved with asphalt.

The building is divided into two sections: the feed room and the shredder room. The feed room contains a conveyor that moves documents through a wall opening into the document destruct shredder. The shredder room has acoustical damping panels in the walls and ceiling. The shredder is an electrically powered machine that grinds the paper documents into a fine dust. Ducting from the shredder conveys the destroyed documents to a dust collector and compactor located just north of the building.

4.7.1.2 Building 313

Building 313 is a metal-framed and corrugated metal-sided building that was formerly a portable building. The building is approximately 18-feet wide and 30-feet long. The building sits on concrete footings over the asphalt-paved surface of a former parking lot area; the building has no floor other than the original paved surface. The building is not supplied with any utilities.

FIGURE 4-12
BUILDING 312, 313 & 315
PLOT PLAN

LEGEND

- x—x—x— FENCE
- STAIN
- △ MW VAPOR MONITOR WELL

4.7.1.3 Building 315

Building 315 is a wood-framed building with stucco siding that was constructed in 1986 as the CALAC Cafe. The building covers approximately 7,000 square-feet of space. The building has an area on the eastern and southern sides that is covered with an aluminum canopy. The rest of the building has a built-up roof over 2.5-foot deep truss joists. The building has a concrete foundation with a crawl space under the floor in the front part of the building. The front (northern) part of the building is used for dining, and the back includes the kitchen and storage areas. Floor sinks in the kitchen area discharge to the sanitary sewer. Four walk-in cold rooms line the back wall of the building. A receiving dock is located under the canopy on the eastern side of the building.

4.7.2 Previous Operations and Present Use

4.7.2.1 Building 312

Prior to the construction of Building 312, the area was used for aircraft parking, fueling and maintenance (during the period of approximately 1942 to 1962) and for automobile parking (from the 1960s to 1983). A blast fence, which was associated with the aircraft operations, was located approximately 20-feet south of the current location of Building 312. These previous operations are discussed in more detail in the Parcel 2 Yard Area section of this report (4.20).

Building 312 was constructed for, and has been continuously used for, the destruction of classified paper documents. Operations at the building have remained essentially the same since its construction in 1983. Prior to construction of the DDS, an outside contractor destroyed the documents with a portable unit.

Details of the DDS operation are discussed below. Paper documents are collected in small metal bins throughout the Plant B-6 facility. These document bins are transported to Building 312, where they are temporarily stored in one of three 8-foot by 40-foot metal storage containers. The document bins are wheeled into Building 312, and the paper is placed on an in-feed table. The paper is conveyed into the shredder and ground into very small pieces. A fan on the dust collector pulls the shredded paper through a 14-inch duct to the collector, where the paper is deposited into the compactor. The compactor has a large ram that pushes the waste paper material into the waste material dumpster. A contractor removes the dumpster for disposal at a landfill.

The paper shredder is lubricated by automatic equipment that draws grease (UNOCAL ALTMP-EP) from a five-gallon bucket located in a small enclosure on the west exterior of the building. The five-gallon bucket is refilled by hand from a 20-gallon drum that is also located in this shed. The compactor incorporates a

hydraulic ram that is powered by a hydraulic pump located just north of the building. A small air compressor is also utilized in the operation.

4.7.2.2 Building 313

Building 313 is used as a storage shed for xerox paper and other paper supplies. The building is skid-mounted and has been used at other locations on Plant B-6. It is unknown what the past uses of this shed were, but facility personnel indicated the building has been at the present location since approximately 1984.

4.7.2.3 Building 315

Building 315 has been used since its construction in 1986 as a dining facility for Plant B-6 employees. Hot and cold meals are prepared at the Cafe by the staff of the food service company (Canteen) that manages the operation. Supplies are received at the dock on the eastern side of the building and are transferred to the cold rooms or the store rooms in the southern part of the building. Food is prepared in the kitchen in the back of the building and is served from a serving line near the center of the building. Diners eat at tables in the northern half of the building. Waste food and supplies are put in a dumpster and are disposed of by the regular disposal service. Waste oil and grease from the kitchen are collected in buckets from the stoves' grease traps and are dumped into a 55-gallon drum located outside of the back of the building. This drummed waste is disposed of by a contractor.

4.7.3 Site Inspection

4.7.3.1 Building 312

The interior of Building 312 is relatively clean. The in-feed table has rollers that allow the paper to be pushed into the shredder. The shredder is a large piece of equipment powered by a large electric motor. The bare concrete floor of the building was clean, with the exception of some very minor oil or grease staining at the shredding machinery. A small area for maintaining the paperwork associated with the document destruct operations is located in the southwest corner of the building. Lighting for the building is provided by fluorescent fixtures.

Outside of the building, on the western wall, is the wooden shed that contains the automatic greasing equipment. The floor of the shed is moderately stained by grease. The asphalt paving is stained in a small area between the grease shed and the hydraulic pump and reservoir, which are located outside of the northwestern corner of the building. Very minor staining is also present on the concrete pad around the air compressor. No staining was observed on the concrete pad around the compactor and dumpster. A patch in the asphalt is visible immediately south of the building where a 10,000-gallon underground tank (B-6-F21) was removed in 1989.

This tank is addressed in the Previous Investigation section of the Building 311 discussion.

4.7.3.2 Building 313

Building 313 contains pallets loaded with xerox paper, a table and chairs, and a few other miscellaneous items. The floor of the building is the original asphalt paving of the parking lot. No stains were observed on the floor of the building or around its exterior. A small wooden shed is located adjacent to the eastern side of the building. Paper is stored in the shed.

4.7.3.3 Building 315

The interior of Building 315 has vinyl flooring in the dining and kitchen areas and bare concrete in the storage and cold room areas. The floors appeared clean, with no staining. Floor drains are visible in the kitchen area, the dishwashing area, and adjacent to the ice machines in the loading dock/storage area. Cleaning supplies and soft drink supplies are stored in a room on the west side of the building. No staining was observed in this room. Lighting for the building is provided by fluorescent fixtures.

The area around Building 315 is paved in asphalt and is primarily used for automobile parking. Outside of Building 315, on the south side, there is a refrigeration condenser for the walk-in cold rooms. This area also contains a waste dumpster and a 300-kVA transformer unit. The transformer is a dry-type unit and does not contain PCBs. A 55-gallon drum that is used to store waste grease and cooking oil is present on the south side of the building, as well. There is some very localized staining of the asphalt at the drum location.

4.8 BUILDING 322

Building 322 is located in the southeastern corner of Plant B-6, Parcel 2, at the intersection of Winona Avenue and North Hollywood Way (see Figure 4-1). Building 322 was constructed for LADC quality assurance testing and equipment calibration operations. Prior to 1963, an asphalt parking lot and Building 318 existed at this location. Building 318 is discussed below in the Previous Operations and Present Use section. Information on the operations in Building 322 was provided by Lockheed employees Mr. Darrel Clark, Mr. Wayne Kravits, Mr. Leonard Larson, Ms. Pat Marquis, Mr. Jim Newton, and Mr. Harley Waggoner.

4.8.1 Construction Details

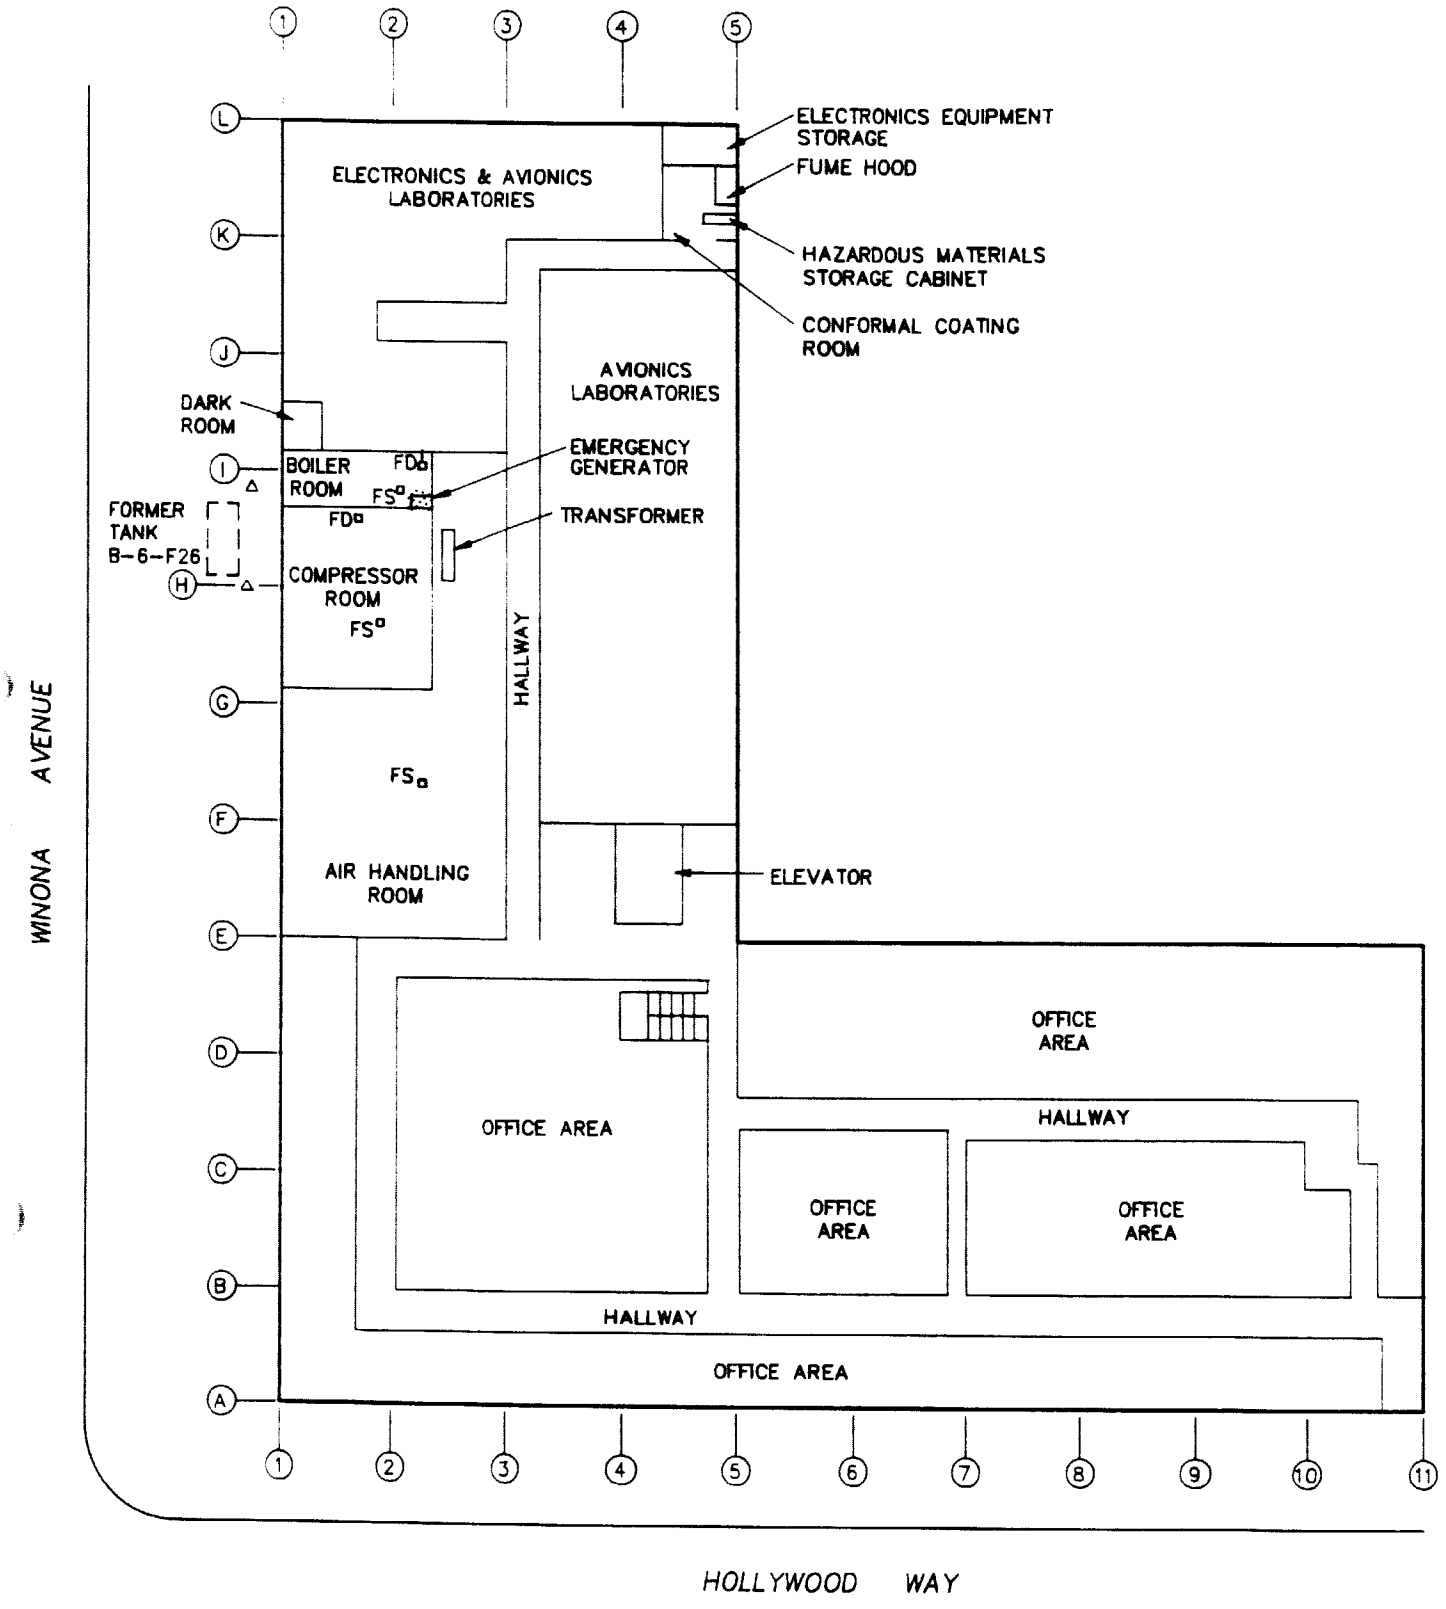

Building 322 was constructed in 1963 and is a single story, pre-cast concrete structure with a basement. The building is "L" shaped, with west and east wings; a basement is located beneath the east wing. The building has approximately 60,500 square-feet of floor space, and for the most part has carpeted or linoleum tile floors, suspended acoustic tile ceilings, and fluorescent lights. The main floor of the building is composed of offices, building equipment rooms, and avionics and electronics laboratories. The basement contains offices and equipment testing and calibration laboratories. The roof of the building, covered with built-up asphaltic-type roofing and a reflective silver coating, contains a cooling tower, ventilation equipment, and a calibration lab. Building 322 is surrounded by an asphalt parking lot to the north and west. To the east and south are Hollywood Way and Winona Avenue, respectively. Figure 4-13 presents a plot plan of Building 322.

A loading ramp and dock were originally constructed on the north side of the west wing of Building 322. This ramp allowed loading and unloading of equipment into the storage area that originally occupied the west end of the west wing. The ramp and dock have since been removed.

The building equipment rooms, which are located on the south side of the west wing, include a boiler room, a compressor room, and an air handling equipment room. These rooms have epoxy-coated concrete floors. The boiler room contains a boiler, an emergency generator, a water heater, a floor sink, and a floor drain. A 10,000-gallon underground tank (B-6-F26), located outside the south wall of the building, served as an emergency fuel supply for the normally gas-fired boiler from 1977 until the tank was removed in 1989. The emergency generator is a natural gas-fueled unit and is located at the northeast corner of the room. The floor sink is located approximately three feet away from the emergency generator, toward the center of the room. The floor drain is located in the northwest corner of the room. Both the floor drain and sink discharge to the sanitary sewer.

BASEMENT

BGPAA 025527

Facility drawings from 1963 show the compressor room containing two air conditioning compressors and two associated chilled water pumps. Piping from the compressors directs condensate to a floor sink located between columns H2 and G2. A floor drain is located adjacent to the boiler room between columns I2 and H2. The floor sink and floor drain discharge to the sanitary sewer.

The air handling equipment room, located at columns E1 to G3, contains air handling units and a floor sink. The floor sink directs condensate from the air handling units to the sanitary sewer. Electrical equipment for the building is located in the open area west of the air handling equipment. A 1963 drawing indicates that the electrical equipment included dry-type air-cooled 300- and 1,000-kVA transformers.

Electronics and avionics laboratories are present in the western portion of the west wing, in the former location of an equipment storage room. The laboratories have epoxy-coated concrete floors or linoleum tile floors, suspended ceiling tiles and fluorescent lights.

The basement contains office areas, a service elevator, an equipment storage area, and testing and calibration laboratories. The testing and calibration laboratories include a hydraulics lab, an oxygen room, a microwave calibration lab, an optical lab, a gauge lab, an electrical reference standards lab, and a force and mass lab. The force and mass lab, gauge lab, and optical lab have vibration-isolated concrete slab floors covered with linoleum tiles. The service elevator, located at column E4, has a below-grade concrete-lined pit underneath the elevator. The elevator pump room has a floor drain with a rock bottom.

4.8.2 Previous Operations and Present Use

Prior to the construction of Building 322, a small building, designated Building 318, was located at the corner of Hollywood Way and Winona Avenue, at the present location of the southeastern corner of Building 322. Building 318 contained electrical switch gear and was removed for the construction of Building 322.

Building 322 was constructed for testing and calibrating instruments and other equipment for LADC operations. The laboratories in the building were used to clean, test, and calibrate flowmeters, gauges, and other equipment that was used at Plant B-6 or that was to be installed on aircraft. Computers, calibrating equipment, electronic equipment, and other gauges and machines were used in the testing and calibration work. Currently, the operations conducted in Building 322 are being transferred to Lockheed's Palmdale facility.

The western portion of the west wing of Building 322 was originally used to store government furnished avionics equipment that was to undergo testing or calibration.

A loading ramp and dock on the northern side of the west wing facilitated shipping and receiving of this equipment. The loading dock and ramp have been eliminated and the storage area has been divided into electronics and avionics laboratories. A small room in the northwest corner of the west wing is still used to store electronics equipment. Just east of this storage room is a small room used for conformal coating of small parts. These paint-like coatings are sprayed onto the part from a small spray paint gun within a 2-foot by 6-foot fume hood. Lockheed personnel indicated that conformal coating was done infrequently on a few small parts in association with the testing operations at the building. The conformal coating material contains approximately 50 percent toluene and 15 percent MEK. A light-proof room, called a "dark room," that is located in the electronics laboratory near column I1, was used until approximately one year ago for spectrometer analysis of light sources. No chemical use was associated with this operation.

Small amounts of chemicals were occasionally used within the laboratories on the main floor and in the basement of Building 322. Chemical use typically consisted of minor spray or wipe applications of electrical component cleaners. Cloths or swabs used for cleaning were reportedly disposed as hazardous waste. Two freon degreasers were used in the basement of the building for occasional cleaning of equipment that was to be tested and calibrated. The free-standing degreasers measured approximately 3-feet by 8-feet and were constructed of stainless steel. One degreaser was located against the eastern wall of the calibration laboratory room, and the other was located against the western wall of the hydraulics laboratory. Lockheed personnel could recall no occurrences of spills from the calibration laboratory degreaser and no major spills from the hydraulics laboratory degreaser. Minor spills of freon may have occurred at both locations. The calibration laboratory has vinyl tiles over the concrete slab floor, and the hydraulics laboratory has an epoxy-coated concrete floor. Spent solvent from the degreasers was drummed and removed by a licensed contractor for off-site disposal or recycling. As the degreasers were only occasionally used, solvent replacement occurred infrequently.

The hydraulics laboratory was used to test and calibrate hydraulic pressure gauges and flow meters. Most testing was accomplished on a free-standing hydraulic flow bench. The flow bench was self-contained and included a pump and a 200-gallon hydraulic fluid reservoir. Small volumes of other oils were used in a second, smaller flow bench. Lockheed personnel indicated that minor spills of Lockheed No. 5606 hydraulic fluid occasionally occurred during calibration operations. Spills were typically wiped up with rags and the rags were disposed as hazardous waste. The flow benches in the hydraulics laboratory were removed in January 1991, and the hydraulic fluids and oils were drummed and properly disposed or recycled under hazardous waste manifest. A service sink is located in the northeast corner of the hydraulics laboratory.

4.8.3 Previous Investigations

Underground storage tank B-6-F26 was installed in 1977 outside the southern wall of Building 322. The tank had a capacity of 10,000 gallons and supplied diesel fuel for the boiler inside Building 322. In 1984, Gregg and Associates drilled two soil borings northwest and northeast of the tank to depths of 13.5 feet and 13 feet, respectively. The soil borings were completed as vapor monitoring wells. Samples were collected from each boring at the 12-foot depth, composited, and analyzed for TPH. The laboratory analysis for TPH reported no detectable compounds; detection limits were not reported. In 1989, ENSR removed the tank and collected two soil samples from the bottom of the excavation. The samples were analyzed for TPH, and the laboratory analysis reported TPH concentrations less than the detection limit of 10 mg/kg.

4.8.4 Site Inspection

A site inspection was performed of the interior and exterior of Building 322. A description of the features observed during the site inspection is presented below.

4.8.4.1 Interior

The offices on the main floor of Building 322 contain desks, chairs, computers, and other office furnishings. No chemical use or staining is present in the office areas.

The conformal coating room, located in the northwest corner of the west wing, contains a fume hood and a hazardous materials storage cabinet. The cabinet was locked at the time of site inspection and the contents were not able to be inspected. No staining is visible in the conformal coating room or in the adjacent electronics equipment storage room.

The boiler room contains a boiler, an emergency generator, and a hot water heater. A floor sink collects condensate from the boiler. The concrete floor in the boiler room is in good condition but is heavily stained with oil in the vicinity of the emergency generator. A corroded one-inch diameter pipe from the adjacent electronics lab is evident near the base of the west wall of the boiler room. It appears that the floor drain located near the west wall receives fluid discharge from this pipe. There are iron staining and water marks on the concrete around the drain. Interviewed Lockheed employees could not recall what may have discharged into the floor drain. There is no evidence of staining adjacent to the hot water heater or the boiler.

The compressor room contains two air conditioning compressors, each with a small chilled water pump. The concrete floor in the compressor room is painted and in good condition. Two condensate pipes from the air compressors direct condensate

into a floor sink. No staining is evident adjacent to the compressors or the small pumps. The floor sink has a minor, unidentified, dark discoloration. A floor drain located in the compressor room is clean with no evidence of staining.

The air handling room contains three large air handling units in the eastern part of the room and electrical equipment in the western part of the room. A floor sink receives condensate from the air handling units. The floor sink is flush mounted in the floor. No staining is visible around the floor sink or the air handling units. The concrete floor is in good condition. Minor discoloration was visible on the concrete floor near the 1,000-kVA transformer and the associated electrical equipment. A 300-kVA transformer that was shown on construction drawings was not present in this room at the time of inspection.

Due to security restrictions, access to the electronics and avionics laboratories on the main floor, including the spectrometer room ("dark room"), was not possible. Lockheed personnel indicated that there was virtually no chemical use in these laboratories.

The laboratories located in the basement of Building 322 were vacant and contained miscellaneous spare parts and electronic equipment, desks, and empty storage racks at the time of inspection. Most of the items still present in these laboratories are being readied for transport to the Palmdale facility. The service sink in the hydraulics laboratory has no visible staining. No staining is present in the vicinity of the Freon degreasers in the hydraulics and calibration laboratories. Minor light to dark brown staining is present on the linoleum floor in the temperature control room and in the calibration laboratory, and on the epoxy-coated concrete floor in the hydraulics laboratory. No staining is present in the other laboratories.

An equipment storage area is located in the basement at columns B2-C3. The equipment storage area has a hazardous materials storage cabinet containing IPA, soldering flux, and a few empty safety cans. Electronic equipment, miscellaneous spare parts, and computer equipment are also stored in this area. No staining was visible in the storage area at the time of inspection. A computer room is located adjacent to the storage area. No staining is visible in the computer room.

The elevator pump room, located in the basement, has a recessed rock-filled floor drain that discharges to the soil. Minor oil staining was visible in the drain and adjacent to the pump. The elevator pit beneath the service elevator has oily staining around the elevator shaft and in two small areas at each end of the pit.

4.8.4.2 Exterior

The cooling tower located on the roof of Building 322 uses Chem Pro Laboratory, Inc., water treatment chemicals. The chemicals include bromochloro-dimethylhydratoin (a biocide), phosphonates, acrylates, phosphates, and sodium bisulfate. Containers of these water treatment chemicals are stored adjacent to the cooling tower. The roof beneath the cooling tower is slightly stained from the cooling tower water. Overflow from the cooling tower drains through a 4-inch diameter pipe that connects to the floor sink in the boiler room and from there discharges to the sanitary sewer.

The calibration room on the roof is vacant and contains calibration equipment, an air flow bench, a sink, and work benches. The linoleum floor beneath the air flow bench is slightly stained. Interviewed Lockheed personnel did not know the source of the discoloration.

An asphalt patch covers the former location of the underground diesel storage tank (B-6-F26) adjacent to the south wall of Building 322. The surrounding asphalt is in good condition with no evidence of staining. Asphalt patches cover trenches that contained supply and return lines from the tank to the boiler room and a vent line from the tank to the south wall of the building. Evidence of the 4-inch vent pipe is visible at the wall directly north of the former tank.

The asphalt pavement north and west of the building is in good condition with no evidence of staining. Evidence of the former location of Building 318 is not visible.

4.9 BUILDING 322T

Building 322T is located in the southern portion of Plant B-6, Parcel 2, approximately 220 feet north of Building 322 and 160 feet east of Building 310 (Figure 4-1). Building 322T was originally utilized as an electrical soldering training facility from 1980 to 1988. Currently, Building 322T is used for office space, security training, and security briefings. Information on Building 322T was obtained through site walks and interviews with Lockheed employees Mr. R.L. Gordon, Mr. J. L. Manning, Ms. Pat Marquis, and Mr. Klaus Rommerswinkel.

4.9.1 Construction Details

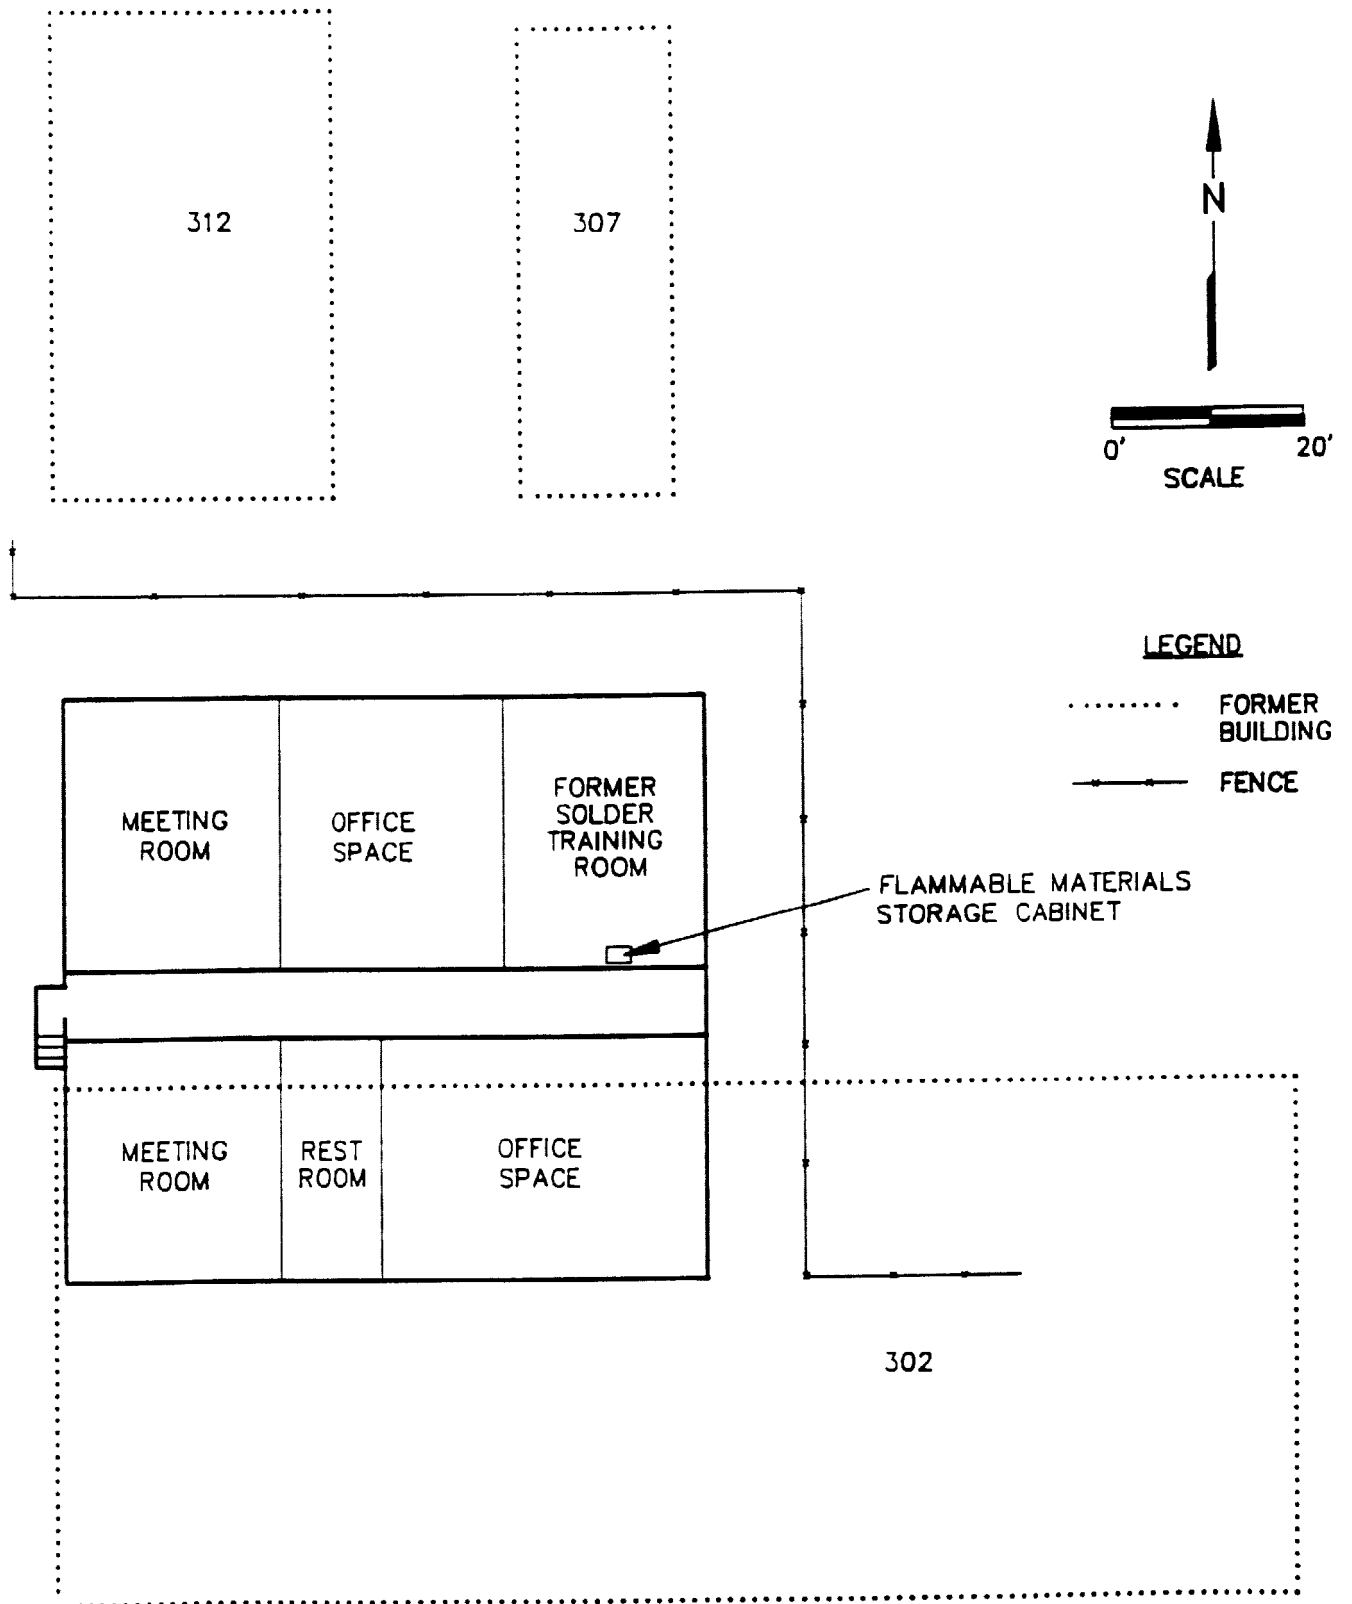

Building 322T is a 4,200-square-foot structure consisting of connected trailers that was constructed in 1980. The building has metal exterior walls and roof, wood interior paneling, linoleum tile floor, acoustic tile ceiling, and fluorescent lights. The building is divided into several offices and work rooms, as shown on Figure 4-14. Electrical power is supplied by two 45-kVA dry-type air-cooled transformers located outside the north wall of the building. Six ventilation units located on the north wall of the building provide heating and cooling. The ground surface under and around Building 322T is paved with asphalt.

4.9.2 Previous Operations and Present Use

Prior to construction of Building 322T, three other structures existed in this area: Buildings 302, 307, and 312. Building 302 contained a woodworking shop, machining area, and paint storage for maintenance operations. Buildings 307 and 312 were flight line and final assembly support buildings. These buildings are discussed in the Parcel 2 Yard Area section of this report (4.20).

Building 322T was used as an electrical soldering training facility from the time of its construction in 1980 until 1988. Lockheed personnel were trained in different methods of soldering for use in aircraft final assembly operations. As part of this training, flux was cleaned off the soldered part with a wire brush dipped in a small amount of IPA. The IPA was dispensed from six-ounce metal containers that were stored in a flammable materials storage cabinet. The bulk supply of IPA was in one-gallon containers that were stored in the flammable materials storage cabinet. Building 322T was also used for security meetings and office space. Since 1988, the building has been used for security training and briefings.

FIGURE 4-14
BUILDING 322T
PLOT PLAN

4.9.3 Site Inspection

Upon inspection, Building 322T consisted of offices, meeting rooms, and a rest room. The flammable materials storage cabinet is present in the room formerly used for solder training. No chemicals were present in the flammable materials storage cabinet. No chemical use or staining was noted in or around Building 322T.

The asphalt surrounding Building 322T was in good condition with no evidence of staining. The former locations of Buildings 302, 307, and 312 were not visible through the asphalt paving.

4.10 BUILDING 325T

Building 325T is located in the southern portion of Plant B-6, Parcel 2, approximately 150 feet east of Building 310, as shown on Figure 4-1. Building 325T is an office trailer that was originally utilized for badging ADP personnel from 1978 to 1991. Currently, Building 325T is used by General Conveyor Company, a contractor, for office space. A small trailer shed is located just south of Building 325T. Information on operations at Building 325T was obtained through site walks and interviews with Lockheed employee Ms. Pat Marquis and contractor personnel at the building.

4.10.1 Construction Details

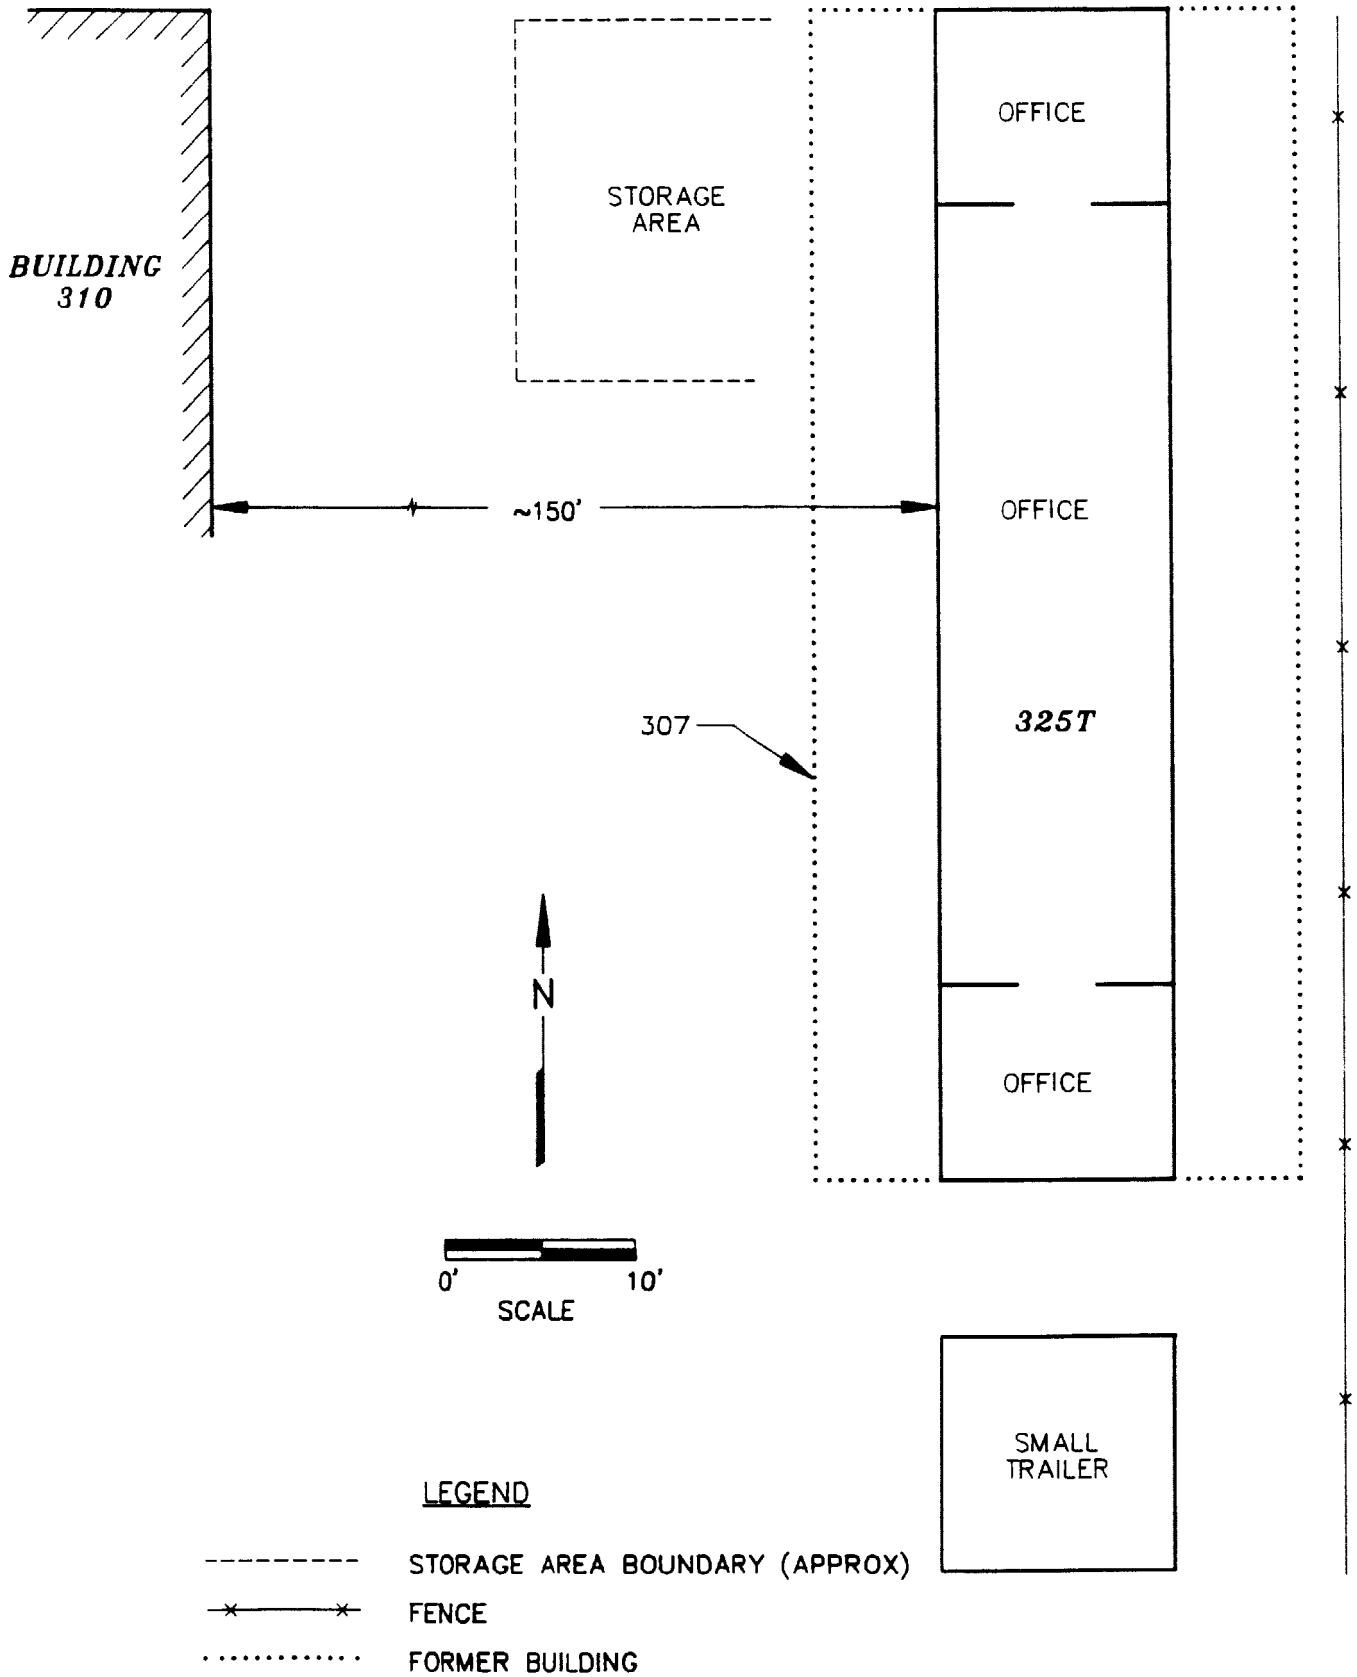

Building 325T is a 720-square-foot trailer that was constructed in 1978. Figure 4-15 presents a plot plan for the building and the surrounding area. The building has metal exterior walls and roof, wood interior paneling, linoleum tile floor, acoustic tile ceiling, and fluorescent lights. A 15-kVA dry-type air-cooled transformer located outside the south wall provides power for the trailer. A wall-mounted ventilation unit located outside the south wall provides heating and cooling for the trailer. The small trailer south of Building 325T has approximately 144 square-feet of floor space and is constructed with metal exterior walls and roof, wood interior paneling and shelves, wood floor, and acoustic tile ceiling. The area around and under Building 325T is paved with asphalt.

4.10.2 Previous Operations and Present Use

Building 325T is an office trailer that was built for processing security badges for ADP personnel beginning in 1978. Prior to 1978, this area was used as an employee parking lot. In 1991, badging operations were discontinued at this location, and the building was leased to General Conveyor Company. General Conveyor maintains the overhead crane and hoist systems at Plant B-6 and uses Building 325T and the surrounding area for office space and storage. There has been no chemical use reported at Building 325T.

Information was not available on the previous operations of the small trailer south of Building 325T. Currently, this trailer is vacant.

FIGURE 4-15
 BUILDING 325T
 PLOT PLAN

4.10.3 Site Inspection

Building 325T contains desks, file cabinets, and other office furnishings. No staining was noted in Building 325T. The small trailer was locked, and inspection of its interior was limited to what was visible through the trailer windows. The small trailer is empty, and no staining is evident. Two compressed gas cylinders containing oxygen and Petrolene are located outside the southeast corner of Building 325T. A box with four 1-gallon plastic bottles of ammonia cleaning solution is present outside the west wall of Building 325T. The gas cylinders and the ammonia solution are temporarily being stored at Building 325T by the contractor for use elsewhere. An equipment storage area is located west of Building 325T on an asphalt area formerly used for parking. The storage area is not enclosed and contains two large storage containers, assorted hoists, carts, tools, and equipment used in the maintenance of overhead conveyor systems. One unidentified 55-gallon drum was noted in the storage yard. No staining is present in the yard area around Building 325T.

4.11 FORMER BUILDING 326

Building 326 is a structure that was formerly located in the central portion of Parcel 2, Plant B-6, as shown on Figure 4-1. Pacific Airmotive Corporation's (PAC) engine test facility is located east of the former Building 326. Building 82 is located to the north and Building 341 is located to the south of the former structure. Building 326 was constructed in late 1965 as a cafe and was demolished in 1989. A concrete slab which formed the floor of the structure is still in place at this location. Building 326 was built in nearly the same location as the former Canteen Number 8. Canteen Number 8 was used as an employee lounge area and a training classroom from 1945 through 1965. A floor plan of the former Building 326 is shown on Figure 4-16.

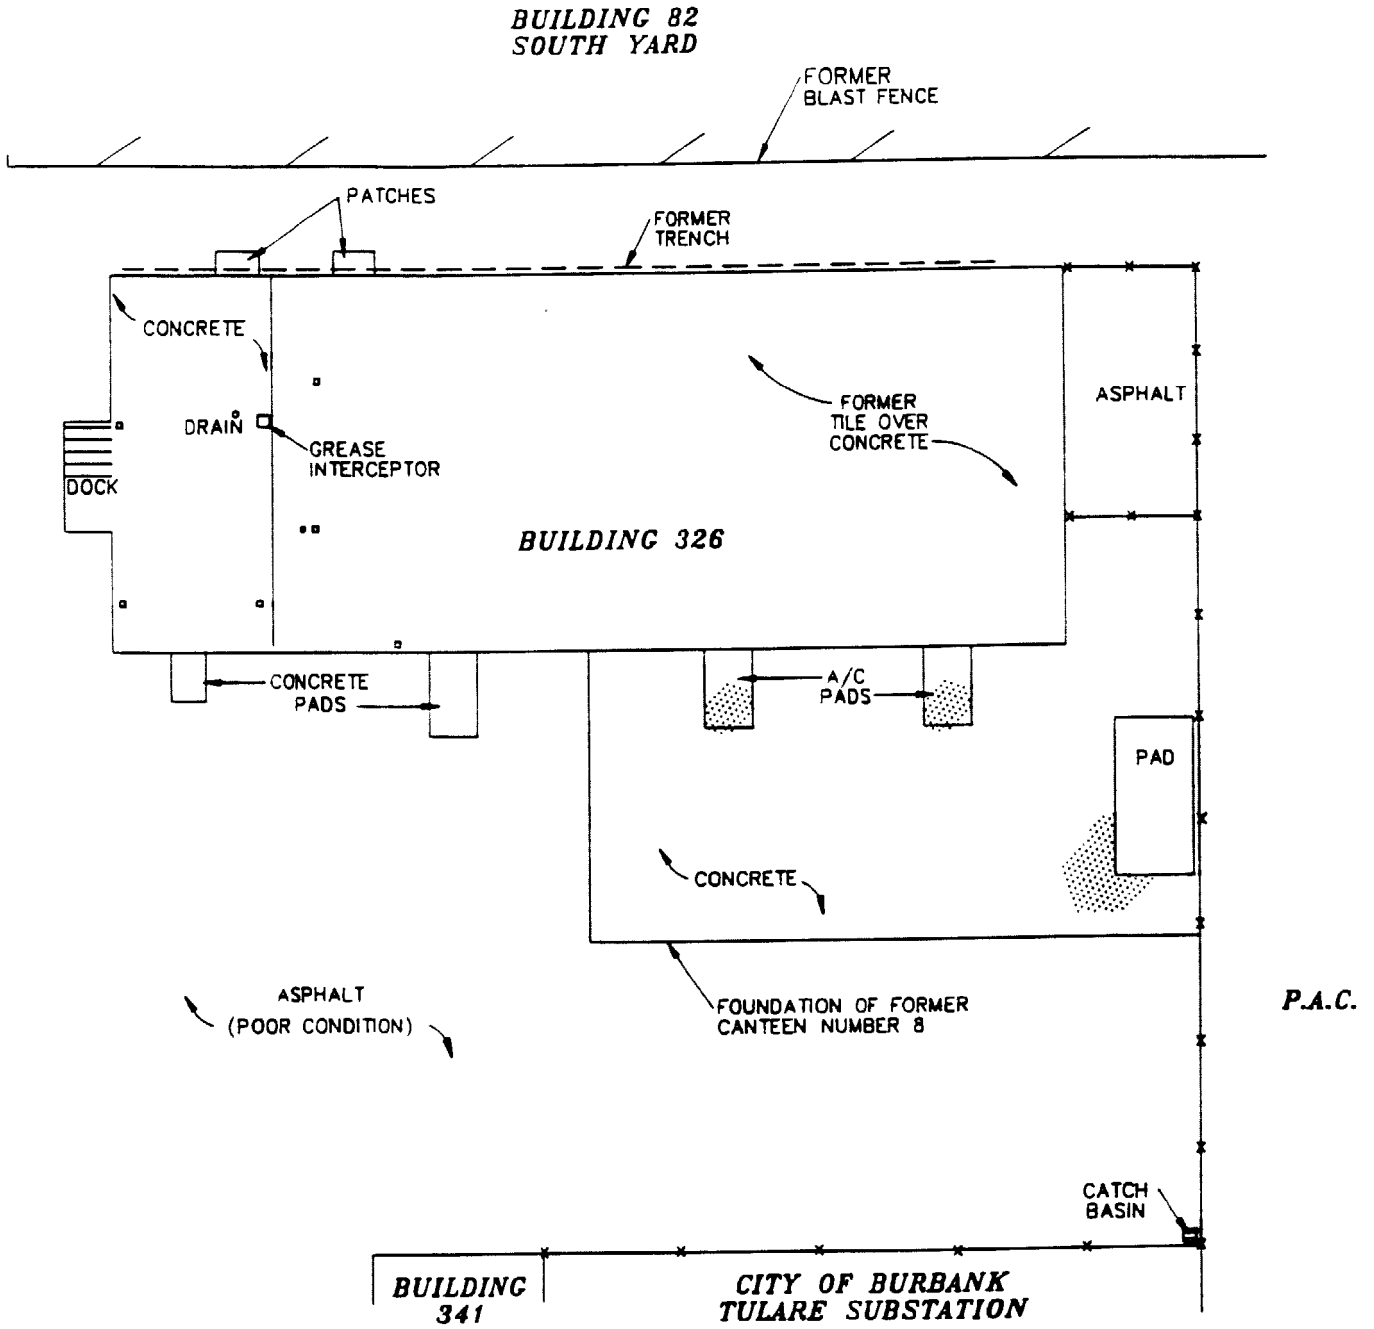

Information on the historical operations at Building 326 and Canteen Number 8 was obtained through interviews and site walks with current Lockheed personnel Mr. Bob Diltz, Mr. Leroy Flynn, Mr. Hans Kluewer, Mr. Don Kruetzfeldt, Mr. Klaus Rommerswinkel, and Mr. A.R. Rudroff. The following discussion is divided into construction details, previous operations and present use, and site inspection.

4.11.1 Construction Details

Canteen Number 8 was constructed in approximately 1945 and covered 4,000 square-feet of space. The canteen consisted of a concrete floor, open side walls, and a sheet metal roof over wood rafters. Canteen Number 8 was demolished in 1965 for construction of Building 326. A partial section of the concrete foundation of the canteen was left in place.

Building 326 construction materials included a concrete floor, masonry and wood walls, and a wood-frame ceiling under a metallic and asphaltic roof. The concrete foundation is level with the existing ground surface on its northern perimeter and is approximately five feet above the ground surface on the southern perimeter. The structure was divided into two sections. Kitchen facilities were located within the western third of the building, while the dining area encompassed the remaining two-thirds of the structure. A four-foot high loading dock is located at the west end of the foundation. Twelve-inch square asbestos tiles covered the eastern two-thirds of the structure. Six floor sinks and one floor drain were located within the western third of the structure, along with a grease interceptor and one sewer clean out. A rainwater collection trench was located along the northern boundary of the building. Four concrete pads are located along the southern perimeter of the foundation. An 8- by 16-foot concrete pad is located approximately 10 feet southeast of Building 326. The pad is outlined with one layer of reinforced masonry blocks filled with concrete.

4.11.2 Previous Operations and Present Use

Canteen Number 8 was used as an employee lounge area from 1945 through 1950. Four sets of horseshoe pits and a courtyard area appear to have been located in the area south of the building. From 1950 through 1965, the facility was used as a riveting training and, for a short time, a soldering training classroom. Classroom activities such as lectures, orientation programs, instruction in operating and set-up procedures for the rivet guns, and bench scale soldering exercises were conducted in the facility. Small quantities of TCE were used in the classroom area for cleaning flux from solder joints. The TCE was stored in eight-ounce and smaller containers. No other chemicals are known to have been used in the facility. Bench seats and chairs are visible in aerial photographs dated 1956 in the Canteen Number 8 Classroom facility.

In late 1965, the canteen was demolished and Building 326 was built as a cafe. Food preparation activities were conducted within the western portion and the dining area occupied the eastern portion of the building. There were four concrete equipment pads adjacent to the south side of the building. Air conditioning units were located on the two larger concrete pads and a natural gas heating unit and a refrigeration unit were located on the other two pads. Apparently, rainwater frequently entered the structure from beneath its northern perimeter, causing flooding within the building. Construction of water cut-off trench to alleviate this problem was initiated but was never completed. The building was demolished in 1989. The sewer line was capped and all floor sinks were filled with asphalt. The foundation was left in place.

A blast fence formerly located immediately north of Building 326 supported activities conducted in Building 82. Operations associated with this blast fence are described in more detail in the Building 82 discussion. An 18-inch square drain, located in the vicinity of the former blast fence, is plumbed to a catch basin located at the southeast corner of the yard area south of Building 326. In approximately 1970, 100 feet of the blast fence was removed in the area immediately north of Building 326.

4.11.3 Site Inspection

Faint outlines of the former asbestos tile are visible on the eastern two-thirds of the Building 326 concrete foundation. Less than 25 tiles are still attached to the floor. All floor sinks are filled with asphalt. The grease interceptor contains a white greasy sludge and water. The clean-out appeared to be free of any sediment. No stains were noted on the concrete foundation.

Concrete patches were noted north of the foundation at locations where the sewer line was capped in place. The rainwater trench is filled with asphalt. No stains were noted in association with these features.

No stains were noted on the two concrete pads near the southwest corner of the Building 326 foundation. Discolored areas (apparently from condensate) were noted on the two air conditioning unit pads on the south side of the foundation. A portion of the former Canteen Number 8 foundation is visible. No stains are visible on the 8- by 16-foot concrete pad southeast of Building 326; however, a small discolored area was noted near its southwest corner.

The asphalt in the area south of Building 326 is in very poor condition and contained numerous cracks and fractures. No structural evidence of the former blast fence is visible directly north of Building 326; however, a linear depression in the asphalt was noted in this area that may reflect the former location of the blast fence. Blast fence concrete footings are present further east of Building 326 and parallel to the PAC property. No significant stains are visible in the parking area to the north or in the yard area south of Building 326. The catch basin located near the southeast corner of the Building 326 south yard area is filled with sediment and runoff debris from the surrounding asphalt. No evidence of oils was noted in the sediment.

4.12 BUILDINGS 332, 333, AND 339

Buildings 332, 333, and 339 are located in the central portion of Parcel 2, Plant B-6, as shown on Figure 4-1. Three former adjacent buildings in this area (Buildings 330, 331, and 332T) are also discussed in this section. Buildings 332, 333 and 339 were constructed adjacent to former Buildings 330 and 331 in 1945. Buildings 332 and 333 were initially utilized to support operations associated with start-up and final testing of completed aircraft. Buildings 332 and 333 are currently used for office space, storage, and a tool crib. Building 339 is a pump house connected to the emergency water reservoir beneath Building 333. Buildings 330 and 331 were used for aircraft and engine shakedown (testing and inspection). The use of former Building 332T is unknown. A plot plan of Buildings 332, 333, and 339 is shown on Figure 4-17.

Information on the historical and present activities at Buildings 332, 333, and 339 and on the historical activities at former Buildings 330, 331, and 332T was compiled through interviews and site walks with the following Lockheed personnel: Mr. Bob Ayale, Mr. Bob Diltz, Mr. LeRoy Flynn, Mr. Hans Kluewer, Mr. Don Kruetzfeldt, Mr. Ron Mosher, Mr. Dick Phones, Mr. A. F. Rudroff, Mr. Don Voss, and Mr. Al Weaver. The tenure of these employees covers operations at Plant B-6 from 1940 through the present. Discussions of the construction details, previous operations and present use, previous investigations, and site inspection of the buildings are presented below.

4.12.1 Construction Details

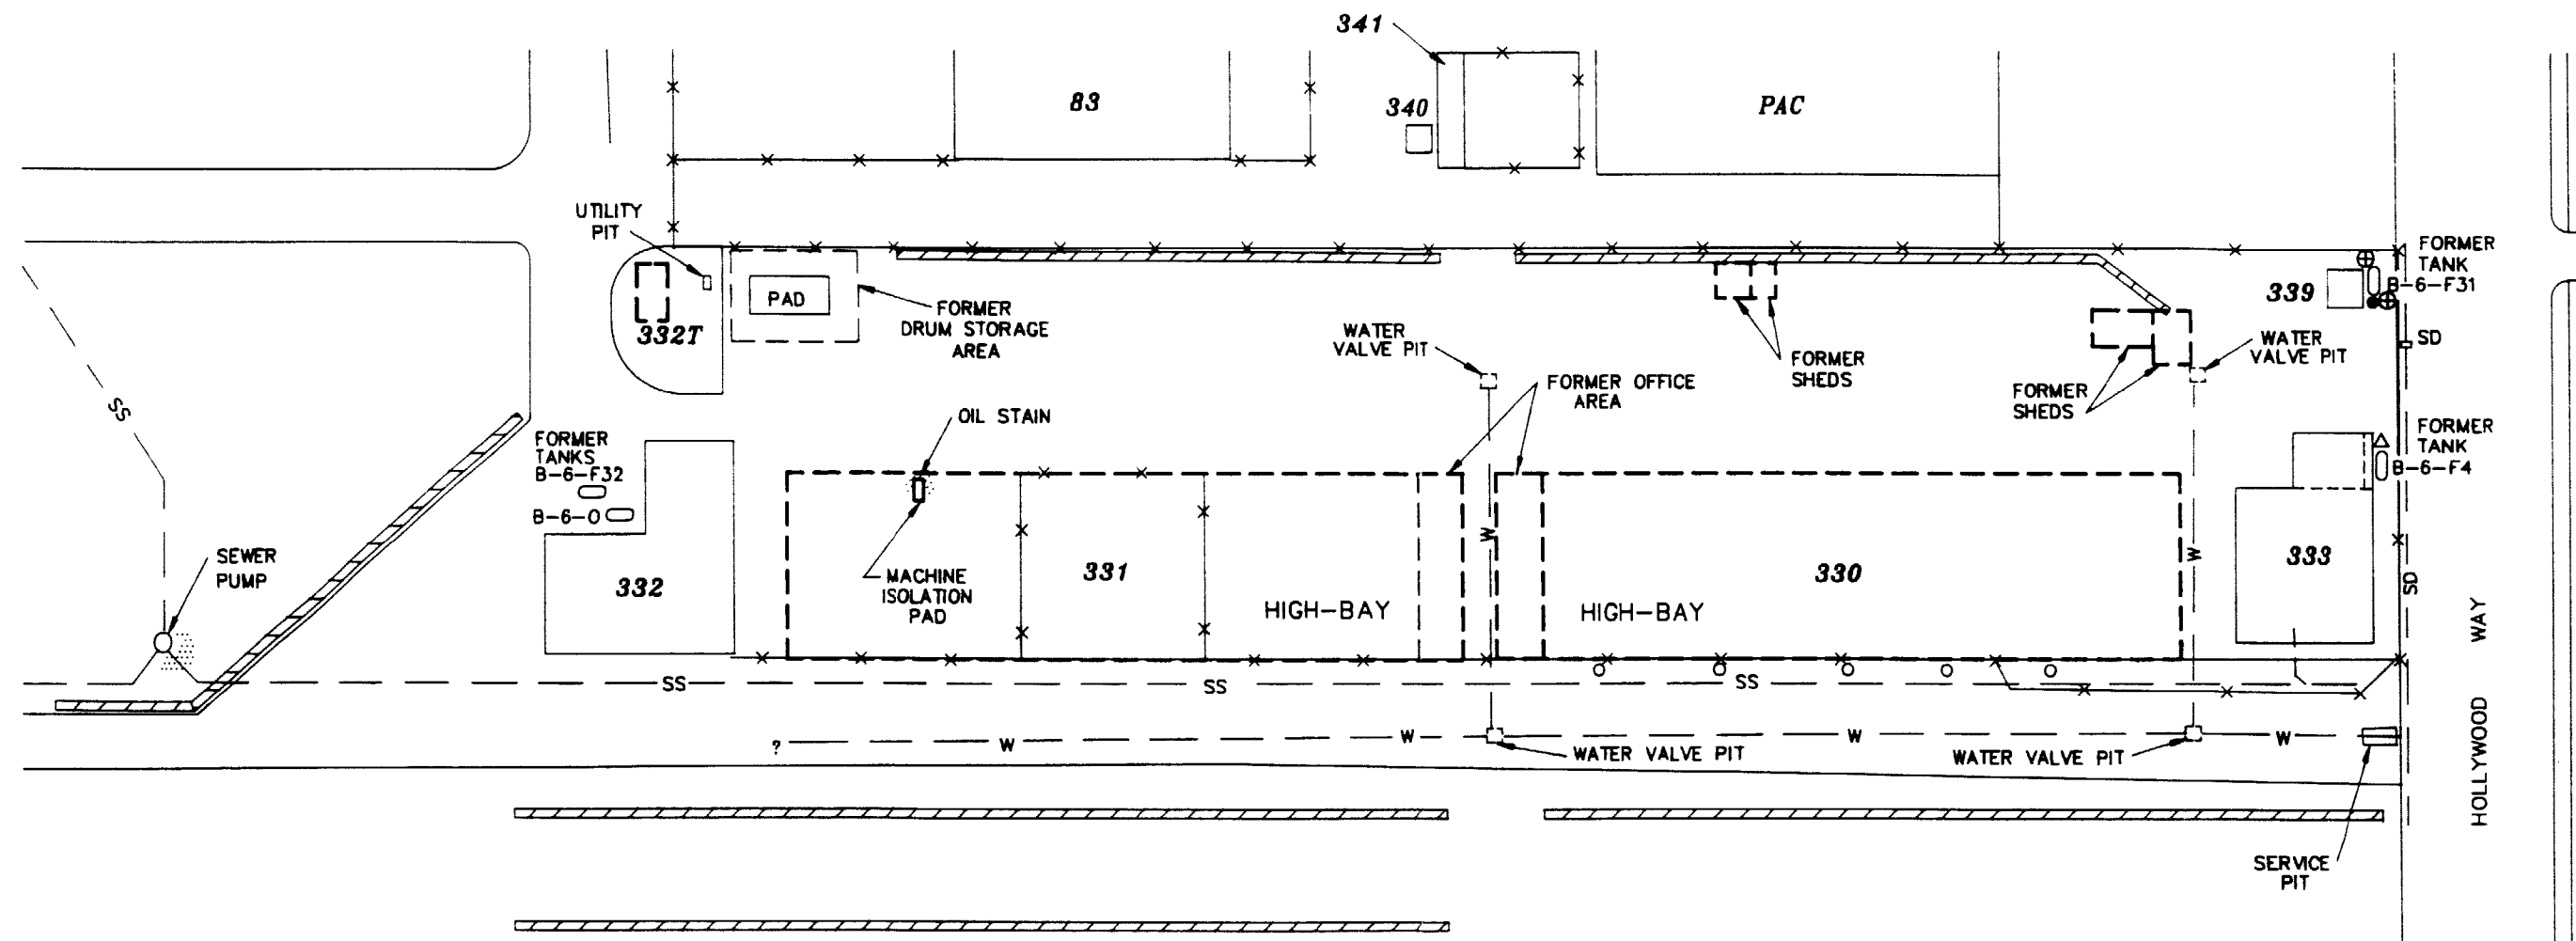

Construction details for Buildings 332, 333, and 339 are discussed below.

4.12.1.1 Building 332

Building 332 is a 14,672-square-foot, two-story structure with a high-bay area (see Figure 4-18). The building has a concrete floor, wood and stucco walls and a wood truss roof. The southern part of the building is an office area that has 12-inch square floor tiles, acoustic ceiling panels and exposed wood frame ceilings and fluorescent light fixtures. Rest rooms within the office area have painted concrete floors, exposed wooden ceilings and fluorescent lights. The high-bay area is located on the northern side of the building and has a painted concrete floor and exposed wooden rafters. The high-bay is heated by an overhead natural gas heater. Three air conditioning units are located on the southern exterior of the building and two units are located on the southern wall of the high bay area.

A 1,400-gallon underground oil storage tank (B-6-F32) was installed approximately 20 feet north of Building 332 in approximately 1945. The tank stored fuel for the water heater and furnace in the building. The heating oil was piped to a small regulating tank in the building and then pumped to the furnace. Asbestos-coated

ducting was used to distribute heat throughout the building. An additional underground tank (B-6-O), reported to be a 70-gallon waste oil tank, was located north of Building 332. No information is available on the usage or contents of this tank. Two utility pits, two hydraulic hoist pits, and an unidentified pit are located in the Building 332 high bay room. The hydraulic hoist pits have reinforced concrete walls and floors and small fluid collection sumps in the pit floors. The larger pit is 12-feet by 3-feet by 10-feet deep with two hydraulic hoists, and the second pit is 3-feet by 2.5-feet by 8-feet deep with one hydraulic hoist. The unidentified pit did not have a designated function and was 13-feet by 2-feet by 5-feet deep, with concrete walls and floor. The utility pits had concrete walls and soil bottoms and contained compressed air and electrical connections.

Building 332 was modified in 1985 to secure the building for LADC work. The modifications included closing and covering all the first floor windows, sealing the first floor doors on the south side, and removing a roof duct that was connected to the second floor.

4.12.1.2 Building 333

Building 333 is a 18,824-square-foot two-story structure with a concrete floor, wooden frame, wood and stucco walls, wooden roof, and fluorescent light fixtures (see Figure 4-17). The first-level floor has portions covered by 9-inch square floor tiles and portions that are painted concrete. The first floor has two rest rooms, each of which has a floor drain that discharges to the sanitary sewer. The second level has wooden floors, some acoustic ceiling panels and some exposed wooden rafters. A 1,400-gallon underground oil storage tank (B-6-F4) was located at the northeast exterior corner of Building 333 to fuel the water heater and furnace in the building. The heating oil was piped to a small regulating tank inside the building and then pumped to the furnace. The building had asbestos-coated ducting to distribute heat. A small air-cooled transformer is located on the first floor. A 509,000-gallon concrete water reservoir is present beneath the building and serves as an emergency fire suppression water source. The reservoir is filled from the city water main and supplies the emergency fire pumps in Building 339.

4.12.1.3 Building 339

Building 339 is a 1,008-square-foot concrete block structure. The building has a painted concrete floor that overlies a 39,000-gallon concrete water reservoir. Emergency fire pumps in the building are supplied by this water reservoir and the reservoir beneath Building 333. The pumps are plumbed into the plant-wide fire main system. A 12-inch concrete berm in the southeast corner of the building provides containment for two aboveground diesel tanks used to fuel two diesel engine fire pumps. The building is illuminated with incandescent lights.

4.12.2 Previous Operations and Present Use

Buildings 332, 333, 339, and former Buildings 330, 331, and 332T have been grouped together for this assessment due to their physical proximity. Most of these buildings have been associated with aircraft inspection and run-up operations; however, Building 339 has always been a pump house. Aircraft run-up operations included pressurizing the oil system and running the engine for the first time, as well as testing and inspecting the various aircraft systems to insure the aircraft is ready for delivery. The use of former Building 332T, which was located north of Building 322, is unknown. Blast fences were located approximately 100 feet north of Buildings 330, 331, and 332, approximately 80 feet south of the buildings, and to the west of Building 332, and were associated with aircraft run-up operations.

A description of operations conducted in the current and former buildings and in the surrounding yard area is presented below.

4.12.2.1 Buildings 330 and 331

Buildings 330 and 331 were located between Buildings 332 and 333, as shown on Figure 4-17. These buildings were constructed sometime between 1942 and 1944 and covered approximately 36,100 and 37,900 square-feet, respectively. The buildings were high-bay structures with concrete floors, wood trusses, purlins and planking. Office areas (distinct from the high-bays) were attached to the western end of Building 330 and to the eastern end of Building 331. The buildings had steel hangar doors that rolled open on the north and south sides. The buildings were used for aircraft and engine shakedown, a thorough final inspection of the entire aircraft. The inspection insured that the parts or equipment met specifications and were properly installed. This inspection included pressurization of hydraulic systems and compressed air systems to check for leaks. The aircraft engines typically were not started during shakedown. Flight line employees indicated that parts that did not meet specifications were routed to the salvage engineering office in Building 330.

After aircraft underwent shakedown in Buildings 330 and 331, they were moved either north or south to the nearby blast fences, where they were started for the first time. Facility personnel indicated that during start-up operations engine oil, and sometimes fuel, was leaked to the ground or was blown out of the engines toward the blast fences and onto the ground. Aerial photographs taken in 1945 and 1946 show evidence of staining on the asphalt between the buildings and the blast fences. A 1946 aerial photograph shows the presence of approximately 40 large crates stored

north of Building 331. The purpose or contents of the crates is not known. Operations in Buildings 330 and 331 appear to have changed at some time between 1946 and 1948. A design drawing from 1948 lists the usage of Buildings 330 and 331 as assembling, fabricating and servicing small planes. Facility personnel could provide no additional information on these reported activities in Buildings 330 and 331.

Buildings 330 and 331, as well as current Buildings 332 and 333 (discussed below), were occupied by Pacific Airmotive Company Aircraft Division (PAC) from the early 1950s through the late 1950s or early 1960s. The primary information available for the buildings during this time period is from aerial photographs. Lockheed facility personnel recalled that PAC used the buildings for modifying P-51 aircraft for a period in the early 1950s. Specific information on these operations was not available. During this period, a fenced, rectangular enclosure north of the west end of Building 331 contained approximately 20 55-gallon drums, as identified on a 1953 photograph, and approximately 50 more drums were noted surrounding the fence. Moderate to significant staining is visible in this drum storage area on the photograph. Miscellaneous items, including crates and fuselage parts, and moderate discolorations are visible in the area between the blast fence and Buildings 330 and 331 on the 1953 photograph. Drum storage and significant surface discoloration were also identified north of Building 331 on aerial photographs from 1956 and 1957, although the fenced enclosure was no longer present. Four small sheds were visible on aerial photographs north of Building 330 during this period. The usage of these sheds is not known.

Lockheed resumed occupation of Buildings 330 and 331 after their use by PAC. A 1965 Lockheed design drawing identified Building 330 as containing radio and instrument shops and aircraft maintenance areas, while Building 331 was identified as being used for aircraft parts storage. Mr. Ron Mosher of Lockheed Highway Transportation indicated that Buildings 330 and 331 were used by LADC for shipping and receiving from at least 1965 through the late 1970s or early 1980s. Items temporarily stored at the buildings included aircraft and automobile engines, television sets, hazardous materials, spray paint, coolant, and hydraulic oils for distribution to Lockheed facilities outside of Burbank.

In the late 1970s or early 1980s, the usage of Buildings 330 and 331 switched from shipping and receiving warehousing to storage of out-of-service machines, including shears, mills, lathes, and brakes from Building 82. Standard Lockheed procedures for transporting machinery require that internal fluids are drained prior to being moved; however, observations of out-of-service machinery at other storage locations at Plant B-6 during site inspections showed pooled or spilled liquid beneath the machines. Building 331 reportedly also stored sheet metal and had one large shear which was used to cut the metal.

At least five dry wells located south of Building 330, and perhaps a similar number south of Building 331, received rainwater from building downspouts. The dry wells were reportedly filled-in in 1982. Buildings 330 and 331 were demolished in approximately 1987.

4.12.2.2 Buildings 332 and 332T

Building 332 was used in the 1940s for hydraulic system testing, aircraft engine servicing, doping and stitching fabric, and metal machining with lathes, grinders, and shapers. Little information was available on these former activities. Two hoist pits are located in the high-bay, as shown on Figure 4-18. The larger pit has two hydraulic hoists for raising objects above floor level, and the smaller pit has one hydraulic hoist. Flight line employees stated that Constellation engines removed from aircraft at the flight lines or run-up lines were brought into the Building 332 high-bay for servicing. It is likely that oils and solvents were used in the aircraft engine servicing operation; however, no specific information was available on their handling or disposal. A 1948 design drawing indicated that doping and fabric stitching occurred in Building 332. Dope is cellulose nitrate or cellulose butyrate that is applied to cloth to stretch and tighten the fabric and make it impermeable to water. Cellulose nitrate is relatively flammable, and is soluble in alcohol, ether, methanol, acetone, glacial acetic acid, and amyl acid while cellulose butyrate is soluble in ketones, organic acetates, methylene, ethylene, and propylene chlorides. The dope was applied to the fabric with brushes which were later cleaned with nitrate or butyrate thinner. It is unknown how waste doping materials and solvents were handled and disposed.

The two-story office area of Building 332 has reportedly always been used as office space. A room on the southwestern corner of the second floor reportedly was used for ground control of flight operations.

Building 332 was occupied by PAC from the early 1950s through the late 1950s or early 1960s. As discussed in the Buildings 330 and 331 section above, PAC reportedly used the buildings in this area for modifying P-51 aircraft. A 1953 aerial photograph shows the presence of Building 332T and two adjacent small open-sided storage sheds located north of Building 332. Building 332T is still visible in a 1956 photograph, but is not present in a 1957 photograph. The former use of Building 332T is unknown.

Lockheed resumed occupation of Building 332 after its use by PAC. Lockheed employees recall that Building 332 was used at that time to store and service aircraft engines and tires. The tires that were filled with compressed nitrogen were stored in safety cages in case of explosion. A Lockheed design drawing indicated that aircraft painting occurred in the high-bay of Building 332 in 1966, but no spray booths were identified on the design drawing. Interviewed Lockheed employees did

not recall any painting activities in Building 332. The high-bay of the building has been used for storage since the 1970s, and is still used in that capacity. The two-story section of the building is used as office space for LADC.

4.12.2.3 Building 333

Building 333 is located just west of Hollywood Way and east of former Building 330. The building was constructed over a 509,000-gallon underground reservoir to be used for fire suppression if the Burbank water supply was ever disrupted. The northern part of the building was used to store and pack parachutes, and design drawings indicate that small drills and lathes were also used in this area. No additional information on the usage of the drills and lathes was available. The southern part of the building had office and storage space, an aircraft instrument inspection shop, and in the mid-1950s had an aircraft oxygen bottle filling station. Parachutes and some other material stored in Building 333 were installed in the aircraft undergoing final inspection in Buildings 330 and 331.

As with Buildings 330, 331, and 332, Building 333 was occupied by PAC from the early 1950s through the late 1950s or early 1960s, after which Lockheed resumed occupation of the building.

The northern part of Building 333 was occupied by the parachute packing shop until April 1991, at which time the operation was moved to Lockheed facilities in Palmdale. The shop had a drying room on the eastern side where parachutes were hung to allow any residual moisture to evaporate prior to being folded. Minor amounts of chemicals were used in the packing shop to spot clean the parachute material and to wax nylon parachute cords to prevent unravelling. The remainder of the first floor has been used as a tool crib and office space. The second floor is used for storage by the Purchasing Department and also provides office space for the Highway Transportation Department.

4.12.2.4 Building 339

Building 339 is located just west of Hollywood Way and north of Building 333. Building 339 is an emergency pump house that can supply fire suppression water to Plant B-6 in the event of a break in service from the City of Burbank water supply. The building has always served in this capacity, although no Lockheed employees could recall the pump house being used. The pump house has two electric pumps and two diesel engine pumps, which are tested on a weekly basis to insure proper operation.

The diesel engines for the pumps were initially fueled by an underground diesel tank, identified as Tank B-6-F31, located east of the building, as shown on Figure 4-17. Two 300-gallon aboveground diesel tanks were installed inside of the east half of Building 339 in approximately 1986, and the underground tank was taken out of

service. The aboveground diesel tanks are supported on metal frames and are surrounded by a 12-inch concrete berm. New engines for the diesel pumps were installed in approximately 1986, at the same time as installation of the aboveground tanks.

4.12.2.5 Surrounding Yard Area

Blast fences were formerly located north and south of former Buildings 330 and 331 and west of Building 332, as shown on Figure 4-17. The blast fences have been identified in aerial photographs as early as 1945. The blast fences were typical wooden A-frame barriers with wood or metal siding. Compressed air lines, industrial water pipes and hose bibs, electrical substations and rest room facilities typically were constructed either beneath or within the blast fence sections. The areas between the buildings and the blast fences to the north and south were used for initial start-up and run-up of aircraft. The aircraft were fueled and lubricated in this area adjacent to the blast fences via a fuel truck that drove directly to the aircraft. Flight line employees indicated that when necessary, engines were removed from aircraft at the blast fences and were taken to Building 332 to be repaired. It is likely that minor amounts of solvents were used to clean parts in the vicinity of the blast fence. The blast fence was removed sometime after 1961.

4.12.3 Previous Investigations

The Building 332, 333, and 339 area includes four former underground storage tanks that were initially investigated by Gregg and Associates in 1984/85 and later by ENSR in 1989 as part of a leak detection survey and underground storage tank closures. The tanks investigated include:

- Tank B-6-F32;
- Tank B-6-O;
- Tank B-6-F4; and
- Tank B-6-F31.

Tank B-6-F32 was located north of Building 332 (see Figure 4-18) and was installed in approximately 1945 to store heating oil for the water heater and furnace in the building. Gregg and Associates reported that the tank stored diesel and investigated Tank B-6-F32 with two soil borings that were completed as vapor monitoring wells. The borings were drilled to 14 and 15 feet below surface and were sampled at depths of 13 and 15 feet, respectively. The soil samples were composited and analyzed for TPH, and 2.1 mg/kg TPH was detected. Gregg and Associates concluded that Tank B-6-F32 was not leaking.

The City of Burbank Fire Department issued a permit to ENSR to remove Tank B-6-F32 in February 1989. The tank was removed in April 1989 and two soil samples were collected from beneath the tank. The soil samples were analyzed for TPH, and 1,230 and 1,500 mg/kg TPH were detected in the soil. ENSR performed follow-up field work at Tank B-6-F32 in June 1989 that included drilling two 41.5-foot deep soil borings within the backfilled tank excavation. Each boring was sampled at the 10-, 15-, 20-, 30-, and 40-foot depths, and three samples from each boring were submitted for TPH analysis. One boring had the 10-, 30- and 40-foot deep samples analyzed, while the other boring had the 10-, 20-, and 40-foot deep samples analyzed. TPH was detected at 668 mg/kg and 20 mg/kg in the 10-foot deep samples, but was not detected in any of the deeper samples. ENSR concluded that the vertical extent of contamination was approximately 10 feet deep (the base of the excavation), and that the lateral extent of contamination was adequately defined by Gregg and Associates' shallow borings that contained less than 10 mg/kg TPH. ENSR estimated that a maximum of 100-square-feet of soil was impacted at Tank B-6-F32.

Tank B-6-O was identified north of Building 332, approximately 25-feet southeast of Tank B-6-F32, during the Gregg 1984/85 survey. Gregg and Associates reported that this was a 70-gallon waste oil tank. The design drawings reviewed for Building 332 did not identify this tank, and its use is unknown. Gregg and Associates drilled two 14-foot deep borings that were completed as vapor monitoring wells to investigate Tank B-6-O. One boring was drilled with a solid-stem auger and was sampled from the auger cuttings, while the other boring was drilled with a hollow-stem auger and was sampled at a depth of 13 feet. The samples were analyzed for TPH, and 114 mg/kg TPH was detected in the auger cuttings sample, while TPH was not detected (detection limit of 0.1 mg/kg) in the 13-foot deep sample. Two 40-foot deep borings were also drilled by Gregg and Associates near Tank B-6-O, and were each sampled at depths of 5, 10, 22, 27, 32, and 40 feet. One of the borings was drilled approximately 5 feet north of Tank B-6-O, and the second boring was drilled approximately 10 feet northwest of Tank B-6-O. The samples from both borings were analyzed for VOCs and TPH. Concentrations of 1.8 mg/kg TPH and 3.8 µg/kg chloromethane were detected at the 5-foot depth in one boring, and 15.5 mg/kg TPH was detected at the 10-foot depth in the second boring; all other analytes were not detected (detection limits ranged from 0.1 to 0.5 µg/kg). Field observations noted strong solvent odors during drilling; however, the laboratory results did not confirm the observations. Gregg and Associates recommended vapor sampling at a later date. In May 1985, the tank was tested by Horner Creative Metals, Inc., under the direction of Gregg and Associates, and was certified tight.

ENSR investigated Tank B-6-O in December 1988 with a 21.5-foot deep boring, and collected samples at the 8- and 20-foot depths for TPH analysis. The laboratory results detected no TPH in the samples (detection limits of 10 mg/kg), and ENSR recommended no further investigation. The City of Burbank Fire Department issued

a permit to ENSR to remove Tank B-6-O in February 1989. The tank was removed in April 1989, and a single soil sample was collected from beneath the tank for diesel analysis. No diesel was detected (detection limit of 10 mg/kg).

Gregg and Associates investigated Tank B-6-F4, located east of Building 333, in 1984 with a 13-foot deep boring that was completed as a vapor monitoring well. Design drawings referenced this as a heating oil tank and Gregg and Associates reported it as a diesel tank. A soil sample collected at a depth of 12 feet was analyzed for TPH, and Gregg and Associates reported that the laboratory did not detect any TPH (detection limit was not reported). The City of Burbank Fire Department issued a permit to ENSR to remove Tank B-6-F4 in February 1989. The tank was removed in March 1989, and two soil samples collected from the tank excavation were analyzed for TPH. Both soil samples had no detectable TPH (detection limit of 10 mg/kg).

Tank B-6-F31 was located east of Building 339 and formerly contained diesel fuel. The tank was tested by Horner Creative Metals, Inc. in June 1985 and was certified tight. ENSR sampled two soil vapor probes around the tank in January 1989 and moderate hydrocarbon vapor levels were reportedly detected in soils adjacent to the tank. ENSR drilled a 41.5-foot deep soil boring, at an angle of 15° from vertical, adjacent to Tank B-6-F31 in February 1989. Soil samples were collected at depths of 3, 15, and 40 feet for TPH analysis. Laboratory results detected 59 mg/kg TPH in the 3-foot sample; no TPH was detected in the other two samples (detection limits of 10 mg/kg). ENSR concluded that the hydrocarbon vapors detected at the soil vapor probes were due to spills during tank filling or leaks from the tank piping and not from the tank itself, since the tank was certified tight in 1985. The City of Burbank Fire Department issued a permit to ENSR to remove Tank B-6-F31 in March 1989, and the tank was removed at that time. Two soil samples were collected from the tank excavation and were analyzed for TPH and BTEX. No compounds were detected in the samples (detection limits of 10 mg/kg TPH and from 50 to 100 µg/kg BTEX).

4.12.4 Site Inspection

A description of the features observed inside each building is discussed below, followed by a description of the surrounding yard area that encompasses the former Building 330, 331, and 332T locations.

4.12.4.1 Interior of Building 332

The high-bay of Building 332 is used for storage of computers and other electrical components. The painted concrete floor is in good condition; no stains were noted during the inspection. One of the two utility pits was inspected and noted to contain electrical and compressed air connections. The bottom of the utility pit is earthen. Steel plates were noted on the floor in the locations of the two hoist pits, and the

southern, larger pit was inspected through a small, six-inch square plate. The pit appeared to contain two hydraulic hoists with hydraulic connections at the base of the hoists. A steel tank located within the pit adjacent to one hoist was assumed to be the reservoir for hydraulic fluid. Fluid was observed at the bottom of the pit. The second pit could not be inspected. A concrete patch was noted at the western wall of the high bay in the vicinity of the former 13-foot long pit. A wooden enclosure is present at the southwestern section of the high-bay; this area is used for storage and contained two air conditioning units. No stains were noted around the air conditioning units.

The two-story office section of Building 332 is a secured area, and only one office and the first floor rest rooms could be inspected. The office contained desks, tables, file cabinets, computers, and chairs, and is reportedly representative of the rest of the office area. The rest rooms contained sinks and toilets, and the adjacent janitorial supply room contained disinfectant, soap, paper towels and mops. No areas of environmental concern were noted in the office area.

4.12.4.2 Interior of Building 333

Portions of the first-level floor in Building 333 are covered with 9-inch square tiles. Outlines of former floor tiles are visible on parts of the concrete floor. The parachute packing shop in the northern part of Building 333 contains two electric drill presses, an electric grinder, and a sewing machine, as well as benches and desks. Approximately one gallon of M6 spot cleaner (contains Freon and dichloromethane) and one pound of beeswax are stored in the shop. Two parachutes were hanging in the drying room and one parachute was in the process of being packed during the time of site inspection. The tool crib contains small tools and the associated offices contain desks, tables, file cabinets and computers. No stains were noted on the painted concrete floor and no areas of environmental concern were identified in the tool crib area.

The second floor has a locker room, break room, rest rooms with showers, offices, empty rooms, and rooms used for storage. The Highway Transportation offices on the second floor contain desks, tables, file cabinets, and a computer. The locker room has benches and lockers, and the break room contains tables and a microwave. The purchasing department storage on the second floor consists of wooden crates on rolling carts. One room also contains a grinder and a sand blast cabinet that are no longer being used.

4.12.4.3 Interior of Building 339

Building 339 is divided into two rooms; the western room contains electric pumps, and the eastern room contains diesel pumps, engines, and aboveground diesel tanks. The eastern room also has a bank of four car batteries in front of each diesel pump engine, and minor battery acid etching was observed under each bank. Minor

staining and dry sweep were noted under the eastern diesel tank. No other stains were noted on the painted concrete floor. Two sounding pipes for the 39,000-gallon reservoir under the building protrude into the eastern room. The western room contained electric switching panels that appeared to be original to the building, as well as two electric pumps. No stains were noted on the painted concrete floor.

4.12.4.4 Surrounding Yard Area

The surrounding yard area incorporates the exteriors of Buildings 332, 333, and 339, the locations of former Buildings 330, 331, and 332T, the area north of the buildings, and the area northwest of the former blast fence N1, west of Building 332.

Three air conditioning units are located at the southern exterior of Building 332, and minor condensate staining was noted on the underlying asphalt of the middle unit. Two asphalt patches that indicate the former locations of Tanks B-6-F32 and B-6-O are located in the yard north of the Building 332 office area. Asphalt patches are visible east of Buildings 333 and 339, indicating the former locations of Tanks B-6-F4 and B-6-F31, respectively.

Former Building 330 was located west of Building 333, and the concrete pad of the building is still present. Asphalt patches (approximately 10 by 15 feet) were observed in the locations of the five dry wells south of Building 330. No similar patches or indications of dry wells south of Building 331 were observed.

The western half of the concrete floor of former Building 330 is used for storage of Highway Transportation vehicles; eight semi-truck cabs and/or trailers were parked in this area during the inspection. The remainder of the concrete pad is used by a drilling subcontractor as a staging and material supply area. Four-inch slotted stainless steel casing, four-inch blank stainless steel casing, pallets of sand and quikgel, and temporary fencing were stored in the area. A large roll-off bin was also present in this area and a moderate oil stain was noted next to the bin.

The eastern portion of the concrete floor of former Building 331 stored 27 Baker tanks at the time of the inspection; many were empty, and one was labeled to contain asbestos. The middle section of the floor is fenced to allow vehicle access from the facility entrance at Gate 119 to the south. The western portion of the floor contains a former machine isolation pad which is surrounded by significant oil stains. Two roll-off bins were present in this area at the time of inspection. Five concrete patches, aligned in a north/south direction, were noted in the concrete floor near the isolation pad. These may have been utility pits. Old 12-inch square floor tiles and tile mastic were noted at the western and eastern end of the concrete floor.

The asphalt paved area north of Buildings 332 and 333 and former Buildings 330 and 331 is used as a staging area for groundwater monitor well drilling operations. North of Building 332, near the location of former Building 332T, is an old utility pit with

an earthen base. A roll-off bin is adjacent to the pit. A concrete pad, raised six inches relative to the surrounding asphalt, is located east of the former location of Building 332T; no stains were noted on the pad. Other equipment associated with drilling staging operations that was noted in this area includes the following: 12 Baker tanks, 5 roll-off bins, a locked storage shed, two-inch pipe, pallets of bentonite, 12 empty 55-gallon drums, drill rig, tractor, pump, pressure washer, plastic covered area for steam cleaning equipment, and two aboveground plastic storage tanks. The asphalt in this area was in fair condition and no significant staining was observed. A loading ramp is present west of the staging area and is used by Highway Transportation.

The area northwest of Building 332 and northwest of the former blast fence is used as a storage area for large flat-bed and enclosed trailers for big-rig trucks. The asphalt in this area is in fair to poor condition with minor to moderate stains and cracks. A large stain was noted next to the manhole access cover to the sewer pump.

4.13 BUILDING 338

Building 338 is located in the eastern portion of Plant B-6, Parcel 2, approximately 650 feet east of Building 311 and adjacent to Hollywood Way (Figures 4-1 and 4-19). Building 338 is a Lockheed Air Terminal (LAT) owned building which was originally constructed to store oil and possibly other fluids, reportedly for flight line and aircraft final assembly operations conducted west of the building during World War II. After termination of aircraft operations in that area in the mid-1940s, LAT leased Building 338. Since the mid-1940s, Building 338 has been leased by several companies. Discussions of the building's construction details, previous operations and present use, and site inspection are presented below. Information on the historical operations in Building 338 was very limited and incomplete because there are no current Lockheed employees with knowledge of the various companies which had leased the building. Information was obtained through interviews and site walks with building lessee Mr. Reginold Vestee of Vestee Kaufmann General Contractors.

4.13.1 Construction Details

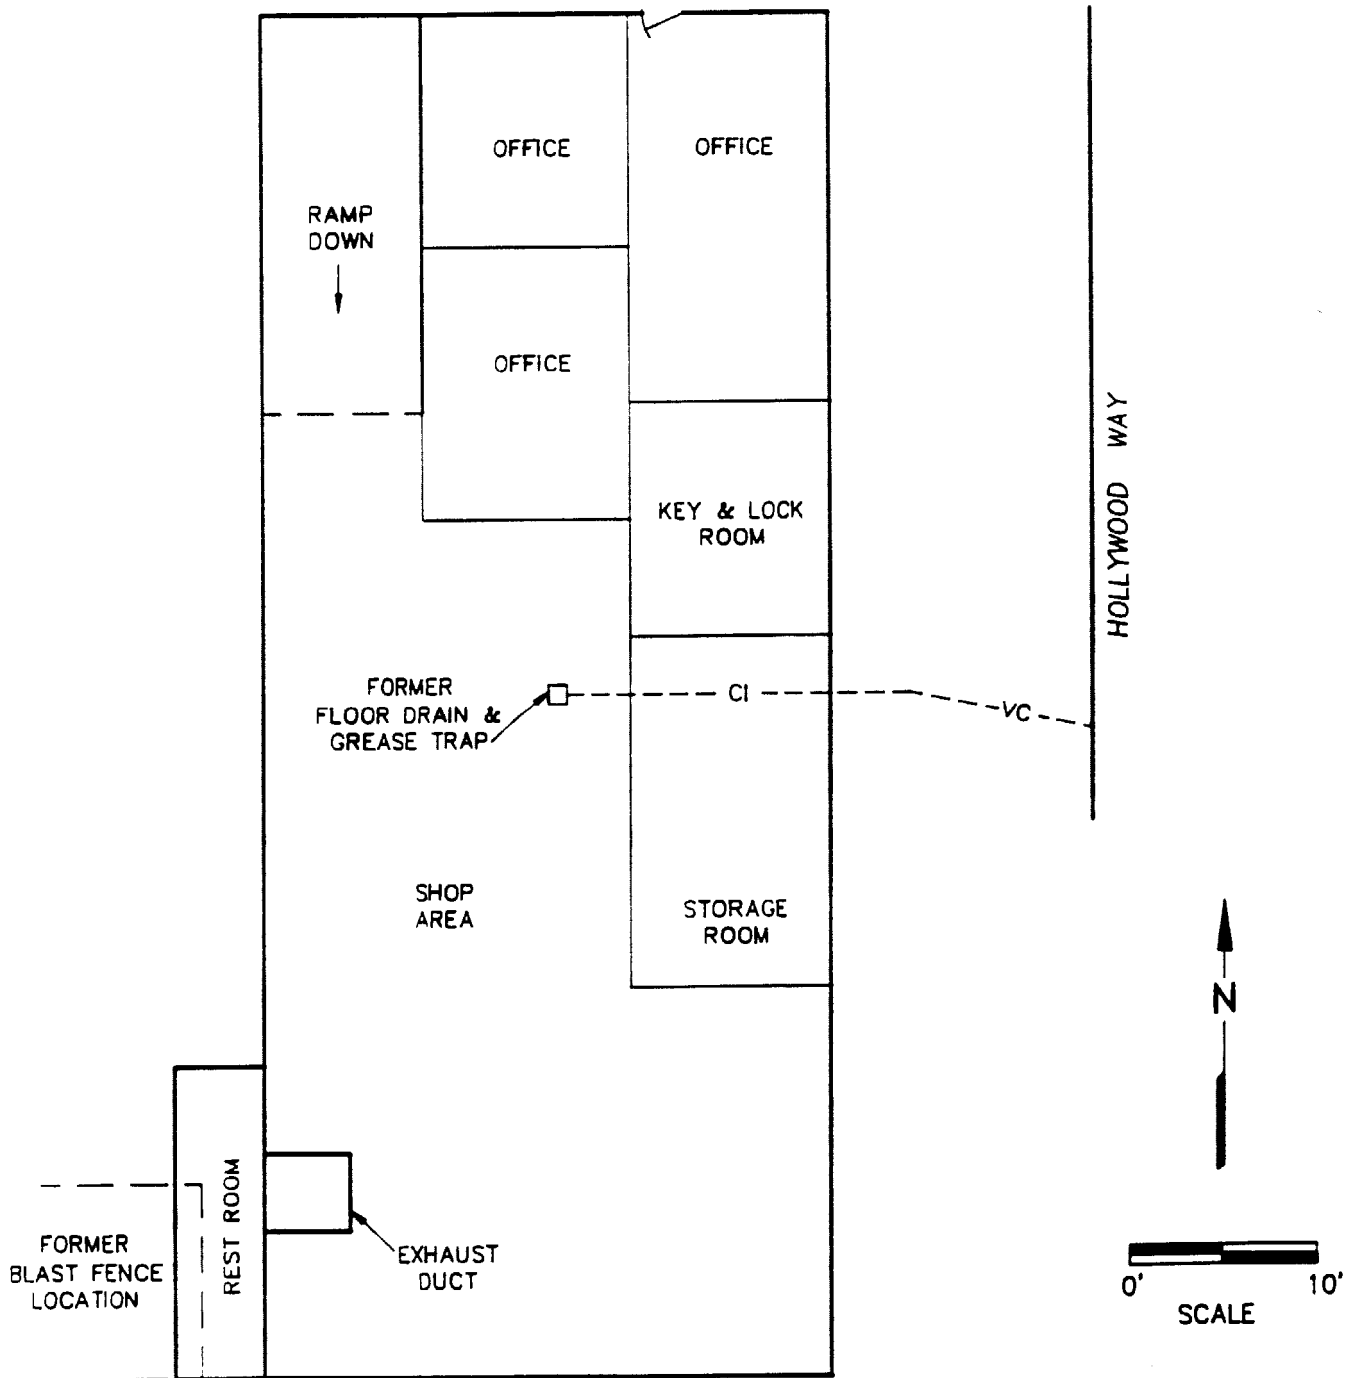

Building 338 is a single story, brick structure that was constructed in 1941 with approximately 2,100-square-feet of floor space. The floor of the building was constructed approximately two-feet below grade, reportedly for oil storage containment purposes. A wood ramp located at the northwest corner of the building was built to slope down into the building. The building has a concrete floor and a wood beam ceiling with suspended fluorescent lights. The roof is covered with asphalt shingles.

When constructed, facility drawings show Building 338 as a single room structure. A storage area, offices, and rest room were constructed in the building in the late 1940s. The office areas have linoleum floor tiles, suspended ceiling tiles and fluorescent lights. The rest room is constructed of wood walls and ceiling, with fluorescent lights and linoleum floor tiles.

A floor drain and grease trap was located in the center of the building. The floor drain discharged to a City of Burbank sewer line beneath Hollywood Way. The drain pipe was constructed of cast iron for the first 18-feet and vitrified clay for the remainder of the line.

Building 338 has an electrical panel attached to the south wall. The electrical panel supplies power to the fluorescent lights, a window-mounted air conditioning unit in the offices, a heater and woodworking equipment located in the shop area, and other electrical equipment.

4.13.2 Previous Operations and Present Use

Building 338 was originally constructed for oil drum storage in 1941. An exhaust duct was located at the southwest corner of the building to vent vapors from the oil and other fluids stored in the building. These fluids were apparently used for flight line and aircraft final assembly operations adjacent to the blast fence west of Building 338. After World War II, flight line and aircraft final assembly operations adjacent to Building 338 were discontinued, and Building 338 was no longer used to store oil or other fluids for these operations.

In the mid-1940s, LAT leased Building 338 to Carter Plating. Carter Plating reportedly used the building for metal plating operations. Chemical use for these plating operations may have included metallic acids, cyanide, and degreasing and other metal cleaning fluids. During the mid- to late-1940s the sewer line from the floor drain in Building 338 no longer functioned properly and was filled in with concrete. By the late 1940s, Carter Plating left Building 338, and LAT leased the building to a company which assembled and stored computing machinery. In the late 1960s the building was used for refinishing furniture. Chemical use for these operations may have included paints, lacquers, varnishes, stains, solvents, and paint strippers. From 1980 to the present day, Vestee Kaufmann General Contractors, Inc. has occupied Building 338.

Vestee Kaufmann General Contractors uses Building 338 for storage of building materials and associated chemicals, and for office space. The shop area is used to store lumber, wood working equipment, and work benches. The storage room is used to store chemicals such as paint, thinners, glue, and cleaning solvents used in building construction operations. Occasionally, woodworking activities are conducted in the shop area.

4.13.3 Site Inspection

A site inspection was performed of the interior of Building 338, as well as the surrounding exterior areas. A description of the features observed during the site inspection is presented below.

4.13.3.1 Building Interior

Very little evidence of former operations are visible in Building 338. The ramp used to transport oil drums into and out of the building is present, as is the exhaust duct that was formerly used to vent the building. The building currently contains three offices, a lock and key room, a storage room, a rest room, and a shop area.

The office areas have suspended ceiling tiles with fluorescent lighting. The floor is covered with linoleum tile. The offices contain desks, filing cabinets, and other office furnishings. No evidence of staining or chemical use was noted.

The lock and key room has suspended ceiling tiles with fluorescent lighting. The floor is covered with linoleum tile. The room contains key making equipment, a work bench, and a large supply of keys and locks. No evidence of staining or chemical use was noted.

The shop area has wood beam ceilings with suspended fluorescent lighting. Sawdust and other debris is scattered about the floor of the shop. The shop area contains sanders, table saws, grinders, work tables, concrete patch materials, and storage areas for lumber. A few quart and gallon containers of shellac thinner, wood stain, paint, solvent, and one box of vinyl asbestos flooring are present on shelves lining the west and east walls in the shop area. The former location of the floor drain is covered with a concrete patch. The floor is depressed in the area around the former drain. No evidence of staining was noted in the shop area.

The storage room has wood shelves that contain quart and gallon containers of glue, paint, oil, wax, alcohol, xylene, Thoroseal 777 (a concrete waterproofing agent), and 1,1,1-trichloroethane. Several three- and five-gallon containers of gasoline, paint, paint thinner, and copper naphthenate were also present in the storage room at the time of inspection. No evidence of staining was noted in the storage room.

4.13.3.2 Building Exterior

Several empty five-gallon gasoline cans, two small air conditioning units, and miscellaneous spare parts are stored outside the west wall of Building 338. No evidence of staining was noted in this area.

Evidence of the former blast fence and flight line area west of Building 338 was visible as cracked and raised areas on the asphalt surface. No evidence of staining was noted on the asphalt paving around Building 338.

4.14 BUILDINGS 340 AND 341

Buildings 340 and 341 are located within the northern portion of Parcel 2, Plant B-6, as shown on Figure 4-1. Buildings 340 and 341 were constructed in 1945 and 1961, respectively, as electrical switchgear stations. An electrical substation operated by the City of Burbank is located directly east, and a concrete-lined storm drain flume is located south, of Building 341. Figure 4-20 presents a plot plan of the buildings and adjacent areas.

Information on the historical and recent operations at Buildings 340 and 341 and the surrounding area was obtained through interviews and site walks with current Lockheed personnel Mr. Bob Anderson and Mr. Hans Kluewer. The following discussion is divided into construction details, previous operations and present use, and site inspection of each building.

4.14.1 Construction Details

Construction details for each of the buildings are discussed below.

4.14.1.1 Building 340

Building 340 covers approximately 400 square-feet of space and is constructed of wood-framed walls and ceiling, and aluminum roofing materials. Two passive air vents are located on the roof of the structure. The floor is uncoated concrete. Lighting is supplied by fluorescent light fixtures. A double-wide sliding door is located on the north side of the structure. Wood shelves line the east, west and south interior walls of Building 340. Two steel mounting strips for electrical switch gear are located in the floor near the center of the structure. A 2-foot wide by 2-foot deep by 11-foot long concrete trench is located near the southern wall. High voltage electrical ducts enter the structure through the floor of a 2½-foot deep concrete pit that is located adjacent to the trench and through the trench wall. The concrete trench bottom has two 1-foot square openings to the soil below to provide for drainage. These openings are designated as "cut-outs" on Figure 4-20. An eight-foot deep dry well is located near the southern exterior wall of Building 340. The dry well is constructed of 12-inch diameter vitrified clay drain tiles that were stacked on end in a bored hole. The dry well has a concrete collar at the top that projects about one-foot above grade, and a wood lid covers the top. A cable duct that crosses the dry well is pierced to allow accumulated water to drain into the dry well.

4.14.1.2 Building 341

Building 341 is an approximately 1,200-square-foot structure with a basement and first floor level. The basement and first level have concrete floors. The walls of the basement are constructed of concrete, and the first floor walls are constructed of masonry brick and mortar. The roof of Building 341 has wood rafters with wood and

FIGURE 4-20
BUILDINGS 340 & 341
PLOT PLAN

- LEGEND**
- CONCRETE CUT-OUT TO EXPOSED SOIL
 - DISCOLORATION

aluminum sheathing covered by asphaltic tar paper. Lighting on the first level is supplied by incandescent light fixtures, and fluorescent fixtures provide lighting in the basement area. An access door is located at the north end of the structure with adjacent stairs leading down to the basement and up to the first floor.

The basement is divided into two sides, east and west, by a concrete wall. Three 5-inch diameter cable ducts enter the structure from Building 340 through the west basement wall approximately 12 inches above the floor. Metal racks occupy the west portion of the basement. Active high voltage wire and cable occupy the east portion of the basement. Large cable ducts from surrounding buildings enter Building 341 from the south, in the east portion of the basement through a 2½-foot deep concrete pit. High voltage cables exit the structure via an approximately four-foot diameter concrete tunnel through the north wall of the basement.

The first floor level, which is five feet above ground surface, houses 10 switchgear units, electrical tie panels, a meter panel, and a 7,500-kVA transformer. A small battery rack is located at the southern interior wall of Building 341. The primary entrance to the building is located on the north side, where stairs lead up to the first level and down to the basement. A double-swing door is located along the west wall of the building. A pad-mounted capacitor is located outside the northeast corner of the structure.

The City of Burbank's Winona-Tulare and Tulare-Clybourn electrical substation (Tulare Substation) was constructed in late 1961 directly adjacent to Building 341. Information provided by the City of Burbank states that the station is composed of a 7.5-million-volt-amperes (MVA) power transformer, a capacitor bank, two oil circuit breakers, and a 15-kVA service transformer which were installed in January of 1962. The transformer was sampled on January 28, 1990 and found to contain 1.8 ppm PCBs. The capacitor bank consists of six capacitors, each containing less than 1 ppm PCBs. The oil circuit breakers were sampled in June of 1990 and found to contain less than 1 ppm PCBs. The 15-kVA service transformer was sampled in December of 1987 and found to contain less than 1 ppm PCBs. Reportedly, there have been no major leaks, problems, or spills due to equipment failure at this substation.

4.14.2 Previous Operations and Present Use

4.14.2.1 Building 340

Building 340 was constructed as an electrical switch-house. Switchgear for the northern portion of Plant B-6 were located in the structure in addition to an auxiliary switch and a main service switchgear unit. All switchgear units were mounted on steel strips located near the center of the building. The switchgear apparatus included four small transformers (one 1.5-kVA and three 2.4-kVA transformers). A former battery rack, composed of 30 Exide batteries, and an associated battery

charger were located along the south wall of the building as an emergency power source. Electrical cables were routed through the concrete trench and associated cable ducts. Apparently, rainwater that would accumulate in Building 340 would drain into the trench and exit through the openings in the floor of the trench. From 1944 through 1961, electrical cables from the switch station in Building 318, located in the southern portion of Parcel 2, were routed to Building 340 via four 5-inch diameter underground transite cable ducts. The dry well located immediately south of Building 340 was used to drain accumulated water from a cable duct that passed under the storm drain flume located to the south. It is not known whether the cable duct that drains to the dry well is one of the four cable ducts from Building 318. In late 1961, electrical power service was disconnected from Building 340 and rerouted to Building 341. Building 340 has since been used for electrical parts and supply storage.

4.14.2.2 Building 341

Building 341 was constructed in 1961 as a two-level switch-house. At that time, new conduit lines were routed to Building 341. Building 341 serves as a switch-house for all main power units in buildings north of the storm water flume.

The basement area, which is divided into east and west portions, serves as an electrical parts storage area and contains active high voltage wire and cable. The first floor level is used to store the operating switchgear units, transformer, and associated electrical panels. The battery rack previously used in Building 340 was relocated in 1962 to the first floor level of Building 341 and later removed in 1982. Currently, four smaller batteries are present for emergency use only. A larger back-up power supply is provided by the City of Burbank's Tulare substation located east of Building 341.

4.14.3 Site Inspection

Observations and features noted during the site inspection of each building are discussed below.

4.14.3.1 Building 340

The concrete floor is dry and in good condition with no major stains or cracks. An approximately six square-foot area near the northwest corner of the facility is slightly weathered and discolored, perhaps by water stains. The electrical equipment mounting plates are visible in the floor and appear to be abandoned. The concrete trench is in good condition and free of any staining. Exposed soil was noted in the two cut-outs in the floor of the trench. No odors or staining were noted in the soil. No stains were noted on the floor in association with the former battery rack.

Items noted on the wood shelves included switchgear parts, spare fluorescent and incandescent fixtures, high voltage cable, rope, wire, fuses, and flood lamps.

A damaged, acoustical tile drop ceiling, which appeared to be installed after the original construction of the building, was noted and shows evidence of deterioration due to precipitation leaking through the roof. Metal pipes and spare power duct piping is stored within the rafters.

Lockheed personnel indicated that there have been no known occurrences of spills or leaks within Building 340.

Approximately 10 feet west of the southwest corner of Building 341, there are two abandoned electrical conduits that are terminated just above the ground. The former use of these conduits is unknown.

4.14.3.2 Building 341

The concrete floor of the basement is in good condition and no stains are visible. The concrete in the power duct pit that is located near the south end of the basement is in good condition. No stains or evidence of excessive moisture were noted near the pit. The western portion of the basement contains metal racks which house switchgear parts, heavy gauge wire, high voltage cable, electric motors, and other miscellaneous electrical parts. The three abandoned power ducts extend through the basement wall from Building 340.

The first level concrete floor is in good condition. White stains are visible near the location of the former battery rack. No stains appear to be associated with the smaller batteries currently in use. No stains or evidence of leakage were noted in association with the 7,500-kVA transformer or the adjoining switchgear units.

4.15 BUILDING 354

Building 354 and former Building 343 are located in the northern portion of Parcel 2, Plant B-6, as shown on Figure 4-1. A plot plan of Building 354 is presented on Figure 4-21. The layout of former Building 343 is also shown on the plot plan. Building 343 was predominately used as a storage facility. Building 354 abuts the east side of Building 352B, and the building is used as a tooling and machining facility. In general, the use of these buildings has not changed significantly since their construction.

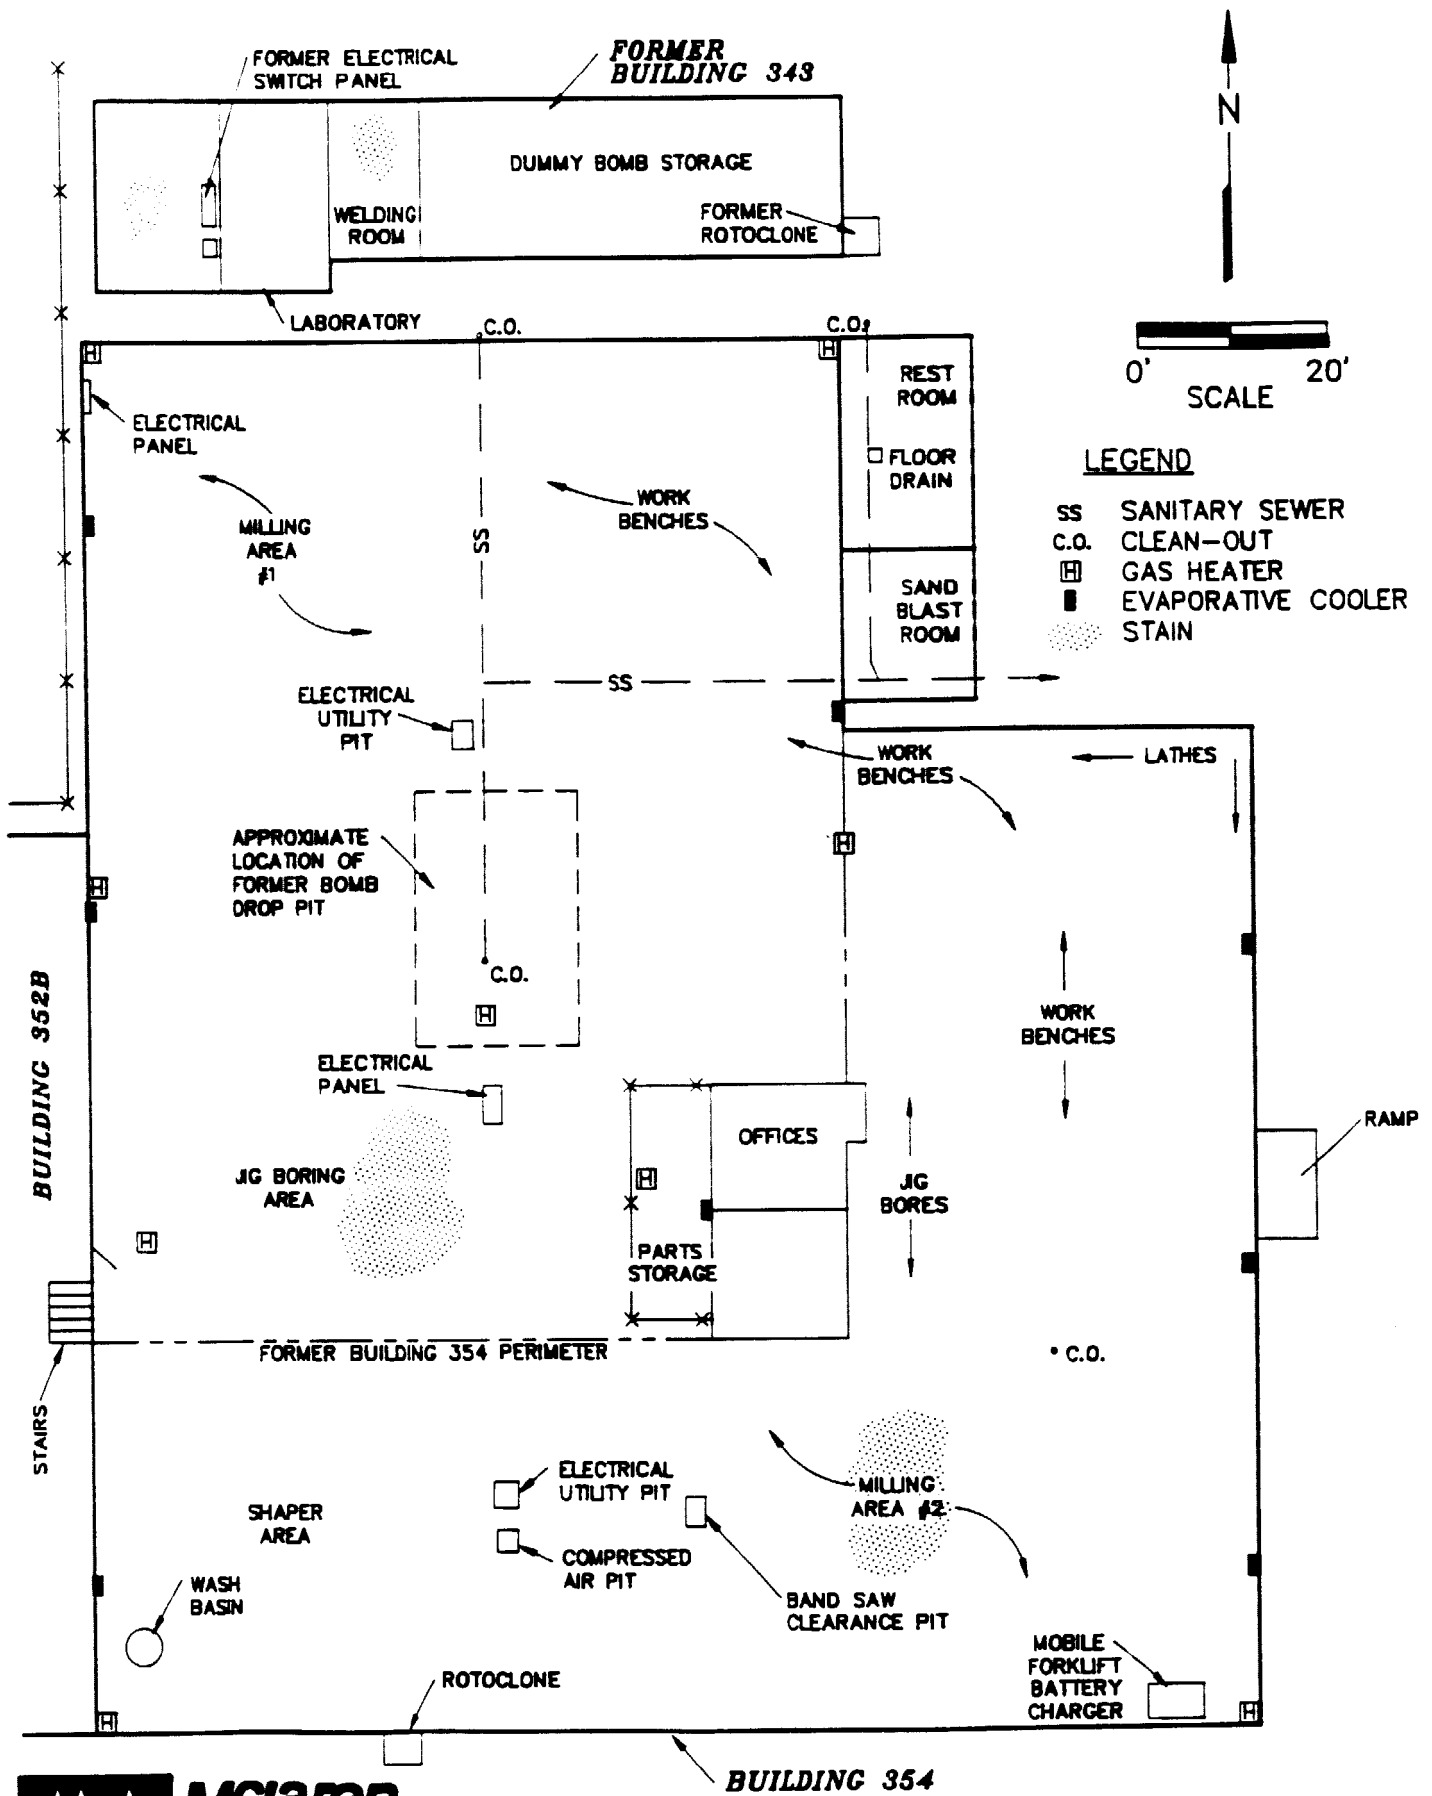

Information on the historical and recent operations at Buildings 343 and 354 was obtained through interviews and site walks with Lockheed personnel Mr. Ron Clark, Mr. Joe Giannone, and Mr. Harley Wagonner. The following discussion is divided into construction details, previous operations and present use, and site inspection of each building.

4.15.1 Construction Details

Building 343, built in 1954, was an approximately 1,200-square-foot structure with a concrete slab foundation, wood-frame walls with asbestos shingle siding, and sheet metal and wood roofing materials. Facility drawings dated pre-1956 show a 160 square-foot welding room and an approximately 200-square-foot laboratory near the west end of the structure. The southern face of the building was constructed with 20-foot wide sliding wood doors. A 240-square-foot area was annexed to the west end of the facility in approximately 1975 and housed electrical and switch panels for storm drain pumps in Building 88. Building 343 was demolished in 1990.

Building 354 was constructed in 1961, and Building 354A was annexed to the south and east walls of Building 354 in 1963 to increase the machine shop area. These buildings are referred to as Building 354 in this report. Building 354 is an approximately 15,500-square-foot structure with concrete floors, a steel-frame and roof trusses, corrugated sheet metal walls, and a metallic roof. Because of the topography in the area, the floor of Building 354 is four feet higher in elevation than the adjacent Building 352 complex. A small two-room office was constructed near the center of the structure. This structure was later converted into a single office. Heating and cooling in Building 354 is provided by nine ceiling-mounted natural gas heaters and seven wall-mounted evaporative coolers. A rest room and a sand blast room are located at the northeast corner of the structure. A floor drain is located within the rest room. Concrete-lined electrical utility and compressed air pits are located in the southern portion of the building, and an electrical utility pit is located in the north-central part of the building. Passive roof vents are located throughout the building. No equipment is located on the roof of the structure.

FIGURE 4-21
BUILDING 354
PLOT PLAN

4.15.2 Previous Operations and Present Use

Previous operations and present uses of Building 343 and Building 354 are discussed below.

4.15.2.1 Building 343

Building 343 was operated as a dummy bomb shelter from 1952 through approximately 1963. Facility drawings dated 1953 indicate the presence of a 15-foot by 25-foot bomb drop pit south of the building where Building 354 is now located. Aerial photographs dated 1953 through 1957 show evidence of miscellaneous parts storage in and around Building 343, including carts, racks, pipes, metal plates, wood, and dummy bombs. These aerial photographs also show large aircraft (Neptune P-2Vs, Constellations, and later models) parked over the bomb drop pit, and a wooden bomb holding tower that was located south of the building. Dummy bombs were rolled out of the south end of the facility and loaded into the aircraft. The aircraft bomb release mechanism was then activated to drop the bomb into the pit. Dummy bombs are visible on a concrete pad located between Building 82 and Building 343 in aerial photographs dated 1957. Welding equipment that was stored in Building 343 was used for alterations or repairs on a bomb holding tower that was sometimes used to test bomb release mechanisms or the drop mechanism in the aircraft. Facility drawings also show a wood shaper, band saw, hack saw, and rotocloner located in the facility. Apparently, some minor wood and metal working had previously been conducted within the facility. Other than minor use of lube grease and oil coolants for the metal cutting equipment, no chemicals were routinely used in this facility. No stains were noted in the historical aerial photographs. A 1956 facility drawing shows a laboratory in the west-central portion of Building 343; however, facility personnel could not recall any use of the area as a laboratory, and drawings from 1961 show this area as a shop.

4.15.2.2 Building 354

Building 354 was constructed in the location of the former Building 343 bomb drop pit. Operations conducted in the Building 354 facility include machining, tooling, and milling. Stainless steel materials are brought into the facility and machined into dies and tools for use in the hot presses in Building 352 and the metal treatment system in Building 353. The metal machining equipment in Building 354 typically uses oil-based cutting fluids (coolants) that are applied to the work piece from a reservoir and pump contained in the machine. Coolant is pumped or drained from the reservoirs when it becomes dirty, and it is placed in drums for off-site recycling or

disposal. New coolant is dispensed to the equipment from 55-gallon drums that are stored in the hazardous materials storage area south of Building 88. Some machines also have hydraulic fluid reservoirs and pumps that power the equipment. Hydraulic fluid is changed-out when it no longer meets specifications and is replaced with new fluid from 55-gallon drums that are also stored near Building 88. Waste fluid is removed for off-site recycling or disposal.

No pits, sumps, or containment basins are used in association with the equipment in Building 354, with the exception of a clearance basin for a rotating band saw, which uses no fluids or chemicals in its operation. All of the large machinery in Building 354 have foundation isolation mounts and stabilization pads. Smaller pieces of equipment rest directly on the concrete floor.

Milling Area Number 1, comprising the northern and western parts of the building, includes drill presses, circular saws with self-contained rotocones, lathes, disc sanders, radial mill presses (Hydrotels), and radial drill presses. The radial mill presses and radial drill presses are hydraulically operated and are equipped with 5- to 20-gallon self-contained hydraulic reservoirs.

Two large jig boring presses are located south of Milling Area Number 1. Two smaller mills and a lathe are also present in the jig boring area. The boring machines, mills, and lathe all have self-contained oil coolant reservoirs and pumps. An electrical control panel is located within this area which provides electrical power to the two large jig boring units.

The shaper area in the southwest portion of Building 354 contains two table shapers, which are connected to a rotocone located outside the south wall of the facility, a pin router, and a rotating band saw, which is partly underlain by an approximately 3 feet long by 2 feet wide by 2 feet deep basin for adjustment clearance purposes. The shapers in this area are used for rough shaping and designing, while the Hydrotel units in Milling Area Number 1 are used to complete the finished product. An employee wash basin, which drains to the sewer, is also located near the shaper area in the southwest corner of the building.

Milling Area Number 2 contains mills, grinders, and disc sanders. A mobile forklift battery charger is located against the south wall of the building in this area. Electric forklifts are occasionally used to transport heavy dies and other materials within the building and to adjoining buildings. Two smaller jig bores are located north of Milling Area Number 2. Two lathes, a band saw, and two drill presses are located to the northeast of these jig bores. The boring machines, mills, lathes, and drill presses have self-contained oil coolant reservoirs.

Numerous work benches are located throughout the facility, but they are primarily stationed within the northern and eastern portions of the structure. These work tables are used to prepare pieces for machining. Layout fluid is applied to the metal

pieces, and reference lines are scribed onto the pieces through the dried layout fluid. After machining, layout fluid remover is used to clean off residual layout fluid. Numerous compressed air outlets extend down from the ceiling throughout the building and are stationed above the work benches. Compressed air is supplied by the plant-wide compressed air system. Two solid granite tables located in the eastern portion of the building are used for inspection purposes. Materials are laid flat on the tables and measured to assure that they meet specifications.

An approximately 200 square-foot fenced area inside the building is located adjacent to the west exterior wall of the office. This enclosed area is used for storage of spare drill bits, die heads, router pins, and miscellaneous equipment parts.

Chemicals used within the facility include Dykem layout fluid (butyl acetate, butyl alcohol) and Dykem remover (ethanol), kerosene and xylene for localized degreasing, hydraulic fluids (dewaxed heavy paraffinic petroleum distillate), and cutting fluids (coolant). Bulk flammable chemicals are stored in the hazardous materials storage area in Building 82. Hydraulic fluids and cutting fluids are stored in 55-gallon drums in the hazardous materials storage area south of Building 88. Lockheed personnel stated that only minor amounts of chemicals are used in Building 354.

The sand blasting room is composed of one large self-contained alumina sand blasting unit. The unit is used to deburr and pre-condition materials prior to their machining in the facility. No chemicals are used in its operation. Waste blasting material is disposed of off-site by a licensed contractor.

4.15.3 Site Inspection

All above grade structures of Building 343 have been demolished, and only the concrete foundation remains. Two isolated areas of staining are evident on the foundation. An approximately 16-square-foot oily stain is located near the former location of the hack saw in the area designated as the welding room in facility drawings. It is likely that the stain results from cutting oil used with the hacksaw. An additional oily stain is located near the west end of the foundation pad. The origin of this stain is unknown. No evidence of a laboratory that is noted on a facility drawing was observed at the time of inspection. Evidence of the rails for the sliding wood doors was noted on the south side of the pad and support brackets were noted at the former locations of the building walls. No evidence of the electrical control panel is visible. The rotocloner, formerly located at the east end of the building, has been removed and reinstalled on the south end of Building 354.

Machining equipment and work benches occupy Building 354. In general, the concrete floor of the building is in good condition with no major fractures or cracks, with the exception of epoxy filled joints where the original Building 354 and Building 354A foundations were adjoined. No evidence of the dummy bomb drop pit is visible in the floor.

Minor amounts of oil staining were noted at the base of machines located within Milling Area Number 1. Dry sweep and saw dust are used to soak up any significant fluids on the floor. Tin drip pans were noted beneath three of the machines and contained between ½ inch to 1½ inches of hydraulic fluid at the time of site inspection. Facility maintenance personnel remove the accumulated fluid from the pans and place it into drums for off-site recycling or disposal. The condition of the inside of the utility pit in this area is unknown, as the pit lid could not be removed.

An approximately 100 square-foot area is stained with oil in the jig boring area. The bases of the two large jig bores are stained with cooling and cutting oils. No other significant stains were visible.

No stains were noted in association with the shaper or the pin router. The clearance basin of the rotating band saw is dry and contains metal shavings. No indication of former oil or other fluid use was visible within the basin. The concrete basin is in good condition. The electrical and compressed air pits located within this area are in good condition and free of any staining. The wash basin and surrounding area are in good condition and free of stains.

The concrete floor around the two mills located within Milling Area Number 2 is stained with oil. Dry sweep was noted along the base of these mills. The stains are limited to the area near the mills. No staining was noted near the smaller jig bores located north of the mills. No stains were noted near the forklift battery charger.

Minor oily staining is visible in the vicinity of the lathes and saws located in the northeast corner of the building. The work benches are in good condition. No stains were noted on the table tops or on the floor beneath them. The rest room is in good condition and free of any staining.

The offices appeared to be in good condition and contained desks, file cabinets, computers, and a printer. No stains were noted in the office structure. The enclosed parts storage area, located against the west exterior wall of the office, contained spare drill bits, die heads, router pins, and miscellaneous equipment parts. No stains were noted in the area.

The sand blast room contained one blasting unit. The sand blaster is electrically powered. The floor is covered with alumina sand particles. Numerous bags of alumina are stacked within this room. Radial saw blades and band saw blades are stored against the south wall of the room. No significant stains were noted on the floor in the room.

The yard areas in the vicinity of Building 354 are paved and in good condition. No major fractures or cracks are visible in the asphalt pavement. No stains were noted on the asphalt, north, south, and east of the building. The area around the rotocloner south of the building is clean.

4.16 BUILDINGS 347, 348, 355, AND 356

Buildings 347, 348, 355, and 356 are located in the north-central portion of Plant B-6, Parcel 2, east of Building 88 and Kenwood Street, as shown on Figure 4-1. A plot plan of these buildings and associated yard areas is shown on Figure 4-22. The buildings were constructed in 1953 and 1961 and are currently used for tool storage, miscellaneous non-hazardous materials storage, template storage, and a template shop, except for Building 348 which is not in use.

Information on the present and historical uses of Buildings 347, 348, 355, and 356 was compiled with the help of the following Lockheed personnel: Ms. Marilyn Bruton, Mr. Ed Cuddihy, Mr. Jim Miles, and Mr. Harley Waggoner. Discussions of the building construction details, previous operations and present use, and site inspection are presented below.

4.16.1 Construction Details

Building 347 was constructed in 1953/1954 and is a 7,200 square-foot structure with a steel frame, walls, and roof on a concrete slab foundation. The metal roof is coated on the outside with a sprayed-application foam covering; no other insulating materials are present in the building. Interior lighting is provided by fluorescent fixtures. A small, floor mounted, air-cooled transformer is located in the central portion of the building adjacent to the west wall. A small enclosed office space is located near the southern end of the building along the west wall. The walls and roof of the office are of wood-frame construction with gypsum board covering. A single wall-mounted air conditioning unit is located in the west wall of the office.

A 1955 design drawing details the installation of a 2,500-gallon underground fuel oil tank just west of Building 347. The underground tank was installed to supply the fuel oil-fired furnace that heated the building. The Building 347 heating system was converted to a natural gas furnace in 1965, and design drawings state that the underground fuel tank was deactivated in accordance with the Burbank Fire Department abandonment procedures, dated April 14, 1965. The specifics of these abandonment procedures were not given.

Building 348 was constructed in 1953 and is an 800 square-foot, cinder block structure with a concrete foundation and roof deck. The roof deck is covered with tar paper. The building has one metal door on the south side, no windows and is lighted by incandescent fixtures.

Building 355 is a 6,400 square-foot northward extension of Building 347 that was constructed in 1961. The concrete slab foundation is sealed with an epoxy type finish and the building has a steel frame, walls, and roof. The metal roof is coated on the

FIGURE 4-22
 BUILDINGS 347, 348, 355, & 356
 PLOT PLAN

outside with a sprayed-application foam. An enclosed lunch room is located in the southeast corner of the building. The walls of the lunch room are wood-framed with gypsum board covering. The building is heated by four ceiling-hung, natural gas heaters and lighted by fluorescent fixtures.

Building 356 was constructed in 1961 and is a 4,000-square-foot structure with a steel frame, walls, and roof on a concrete slab foundation. The metal roof is coated on the outside with a sprayed-application foam. Interior lighting is provided by fluorescent fixtures. A floor-mounted, air-cooled transformer is located adjacent to the west wall.

4.16.2 Previous Operations and Present Use

The area currently occupied by Buildings 347, 348, 355, and 356 was an undeveloped field when Lockheed began operations at Plant B-6 in 1941. The Building 347 site and the yard area west of the building extending to Building 88 was paved with asphalt by 1945 and was used as an outside storage area for Building 88 operations and as an aircraft parking area until 1953. Moderate staining on the asphalt at the Building 347 site and the yard area to the west is visible in a 1952 aerial photograph. Buildings 347 and 348 were constructed in 1953.

The unpaved yard area north of Building 347, including the triangular-shaped yard (see Figure 4-22), appeared to be fenced and used for storage in a 1954 aerial photograph. Items stored in this area could not be positively identified on the aerial photographs. The yard area was paved with asphalt by 1956 and appeared to be used for parking, except for a fenced storage area immediately north of Building 347 that contained large crates, several large cylinders, possibly large drums, a large metal frame or scaffold, and other items that could not be identified on the photograph. Buildings 355 and 356 were constructed in 1961.

Building 347 was constructed for template storage and has been used in that capacity continuously. A 1966 Sanborn map indicated that chemical storage occurred inside or outside of Building 348; however, Lockheed employees could not confirm that. Lockheed employees stated that Building 348 has been used for classified document storage continuously through 1990.

Buildings 355 and 356 were constructed for additional template (tool) storage space and were used in that capacity until the mid-1980s when they were converted for use as template shops. At that time, the tools stored in Buildings 355 and 356 were moved to outside locations south of Building 356 and west of Building 347. A steel frame awning was constructed on the west side of Building 347 in 1990 to cover stored tools. Building 355 was used from the mid-1980s through 1990 in conjunction with template operations in Building 356. Sheet metal with scribed template patterns was cut, drilled, shaped, and sanded to specification in Building 355 using electrical and pneumatic tools. No lubricants or other chemicals were used in these

operations. The template shop operations in Building 355 were discontinued in 1990, and the building has been used since for miscellaneous storage, including storage of the decommissioned machinery formerly used within the building.

Building 356 has been used since the mid-1980s to fabricate aluminum sheet metal templates. Sheet metal stock is received at Building 356 with one side painted white. The stock sheet metal is cut to a working size on electric sheet metal shears and is then sprayed with light-sensitive developing fluid (diazine) in a spray booth located in the northwest corner of the building. The spray booth is currently permitted to operate by SCAQMD under permit number R-M45926. Patterned mylar sheets are laid over the prepared sheet metal surface and exposed to light on the developing table which transfers the pattern to the sheet metal. The sheet metal is then cut to the template pattern in Building 355. Templates are also fabricated on a computerized high speed profiler located in the southern half of Building 356. The profiler scans mylar patterns and produces formed templates to specifications by cutting a piece of sheet metal with a router-like bit. No cutting fluids or other chemicals are used in this operation. Compressed air is used to cool the cutting bit and remove the metal shavings from the cutting site. Scrap pieces of aluminum are placed in a bin for recycling, and the cutting dust that falls to the floor is disposed to the garbage.

Four compressed gas cylinders of ammonia were formerly located along the outside north wall of Building 356 near the spray booth location. The ammonia gas was used in the process of transferring template outlines to sheet metal surfaces.

4.16.3 Site Inspection

The discussion of the site inspection includes the interior areas of the buildings and the associated exterior areas. The exterior areas include the yard areas west of Building 347 and 348 and the areas between and north of Buildings 355 and 356.

4.16.3.1 Building 347

Building 347 is primarily used to store sheet metal templates in metal racks. The office at the southern end of the building and two fenced enclosures are used for stock inventory and control operations. The enclosed stock control office contains a computer console, copy machine, safe, file cabinets, computer card reader, table, and an office supply cabinet. Two small areas enclosed by chain link fence contain stock control computers and records. One is located adjacent to the north side of the enclosed office space, and the other enclosure is located on the west wall in the central portion of the building.

Three electric, revolving template files are located in the southeast corner of the building. Other items noted in the building include supply cabinets, a card catalog, a refrigerator, a battery charger, and a drinking fountain. The supply cabinets contain

paper, personal protective equipment, tools, and office supplies. No chemical storage or significant stains were noted in the building. A large crack trending east-west is present in the concrete slab in the central portion of the building.

The natural gas-fired furnace is located along the inside west wall of the building in a 6-inch deep concrete pit surrounded by a 3-inch concrete berm. The pit is dusty, but no stains were observed. A metal plate in the southwest corner of the furnace pit could not be raised for inspection. Lockheed employees stated that the plate was originally associated with the former fuel oil lines and now covers soil.

4.16.3.2 Building 348

Building 348 was not in use at the time of the site inspection. The building contained rows of empty metal shelves that had contained classified documents prior to 1991. The concrete floor was dusty, but no significant stains were noted.

4.16.3.3 Interior of Building 355

Building 355 was reclassified from a template shop to a storage facility in early 1991. Stored materials include paper, cardboard, plastic, sheet metal, small metal parts, packing and padding material, personal protective equipment, rope, broom handles, trash cans, tool parts such as drill bits, grinding wheels, and abrasives, and other miscellaneous items. Lockheed employees stated that no liquids of any kind are stored in this building.

The materials are stored on tables formerly used in the production of sheet metal templates, on racks, pallets, and on the floor. A hand-operated electric forklift is used to move pallets of material within the storage area. The template layout tables are fitted with fluorescent lighting and compressed air connections for the former use of pneumatic tools.

Free-standing electrical power tools formerly used in the Building 355 template shop are present along the west wall in the northern half of the building and in three locations in the southern half. The power tools include band saws, sheet metal shears, drill presses, hole punches, and sanders; no self-contained fluid reservoirs were noted on the machines.

The small lunch room in the southeast corner of the building contains lockers, a table and chairs, and a refrigerator. An electrical panel is located near the southwest corner of the building. A minor white stain was noted on the floor in the vicinity of the electrical panel. The concrete floor was in good condition and no other significant stains were noted.

4.16.3.4 Interior of Building 356

Building 356 is currently used as a template shop. The building houses a dry-media spray booth, sheet metal shears, two developer tables, a computer-controlled high speed profiler, and a classified mylar storage area.

Stock sheet metal and packaging cardboard are stored on racks in the northeast corner of the building. The sheet metal shears have a self-contained oil lubrication system with a one-half-gallon reservoir. The oil is used to lubricate moving parts in the machine and is not used on the sheet metal. No staining was observed on the floor around the shears.

The spray booth and the surrounding floor are relatively clean. A small freestanding spray gun cleaner is located in the spray booth and reportedly uses MIBK as the cleaning agent. The spray booth is vented through the north wall of the building. A flammable materials storage cabinet was formerly located near the spray booth along the west wall of the building. Solvents were stored in this cabinet prior to the installation of the spray gun cleaner.

The high-speed profiler is fitted with an exhaust duct that removes heat and some of the very fine cutting dust from the cutting tool area. The exhaust duct is routed to a fan on the west exterior wall of the building. Any dust exhausted by the duct and fan is discharged to the outside and is not collected. Two cabinets along the east wall near the profiler contain profiler tools and developer paper.

The classified mylar storage area at the south end of the building is a secured area that could not be inspected. The enclosure consisted of wood-frame walls and ceiling covered with foam insulating tiles. Air conditioning units are located on the top of the enclosure to provide climate control in the storage area.

A small, floor-mounted, air-cooled transformer is located near the developing tables along the west wall. Compressed air is supplied to the spray booth, developer tables, and the profiler through overhead lines that are connected to the plant-wide compressed air supply.

4.16.3.5 Exterior Areas

The asphalt surface in the yard areas around the buildings and in the triangular-shaped yard area is in fair to poor condition. Minor paint stains were noted on the asphalt between Buildings 355 and 356. The remaining asphalt areas were not significantly stained at the time of the site inspection. Tool storage racks are located south of Building 356 and west of Building 347. The storage area west of Building 347 is covered with a metal awning. An asphalt patch was noted beneath a tool storage rack under the awning. This patch, located outside of the furnace installation, may be the location of the former underground fuel oil tank.

The triangular-shaped yard is a fenced and locked area and is used for miscellaneous storage. Items noted in this area during the site inspection included pallets, dollies, racks, crates, and bins containing mainly scrap steel, aluminum, wood and parts. The asphalt has small, isolated, oil-stained areas and weeds growing through the cracks.

4.17 BUILDING 349

Building 349 is located within the secured LADC area of Plant B-6 near the northwestern corner of Parcel 2, as shown on Figure 4-1. The building is bisected by the boundary of Parcel 1 and Parcel 2. A floor plan is shown on Figure 4-23.

Information on the present and historical use of Building 349 was compiled with the help of the following Lockheed personnel: Mr. Phil Aciena, Mr. Michael Donathan, Mr. Joe Giannone, Mr. Ted Melvin, Mr. Robert Miland, Mr. Bill Robinson, and Mr. Al Weaver. Discussions of the building construction details, previous operations and present use, previous investigations, and site inspection are presented below.

4.17.1 Construction Details

Building 349 is a one-story, 8,500 square-foot structure located south of and adjacent to the westernmost portion of Building 352 that was formerly known as Buildings 353B and 353A. Construction materials consist of steel trusses and girts, corrugated metal walls, and a concrete slab floor. A paint storage and paint mix area in the southern portion of the building has concrete block walls. All utilities enter the building above ground. There are no utility trenches inside the building. Building 349 has overhead fluorescent lighting.

Building 349 has been used since its construction in 1981 as a paint spray and paint storage facility. The building contains a paint spray booth, paint storage and paint mix rooms, a batch oven, an electrical room, and an open work bench area. An air handler for heating and air conditioning is mounted on a platform suspended beneath the roof trusses. An underground emergency overflow holding tank is located immediately south of Building 349. A fenced, covered, bermed hazardous materials storage area and a concrete pad are located between the building and a security fence to the south. The remainder of the yard surrounding Building 349 is paved with asphalt. The asphalt-paved areas east and south of the hazardous materials area are used for automobile parking.

4.17.2 Previous Operations and Present Use

Prior to the construction of Building 349, an approximately 90-foot by 45-foot oil storage area occupied the southern portion of the present building location. According to Lockheed personnel, the oil storage area had been in place at least since the late 1950s and was used for support of a small parts fabrication machine shop in Building 82. Oil dispensing mostly occurred within Building 82, although some dispensing may have occurred at the oil storage area. Waste oil generated within the buildings in the LADC secured area was drummed and sent to the Plant B-1 salvage yard or directly to an outside contractor for reclamation. A facilities drawing dated 1978 showed the oil storage area as having no slurry seal or

FIGURE 4-23
BUILDING 349
PLOT PLAN

asphalt paving. The oil storage area was paved in approximately 1980, and Building 349 was constructed over it in approximately 1981. After the construction of Building 349 began, the oil barrel storage area was moved to its present location south of Building 88, the security fence was moved south to its present location, and temporary hazardous materials storage area was set up near the fence by painting an outline with "hazardous material" and "empty barrels" designations on the asphalt pavement. Reportedly, many of the drums stored in the temporary hazardous materials storage area were in poor condition; however, no significant spills were reported to have occurred.

In approximately 1982, the current fenced hazardous materials storage area was set up south of Building 349. A covered, bermed, raised concrete pad along the western fence of the storage area contains mostly virgin products, primarily caustics and oxidizers for use in Buildings 352 and 353. Up to 150 drums of chemicals have been stored in this area at one time. Current production schedules, purchasing practices, and the relocation of flammable materials to the storage area west of Building 83 have reduced the volume of new chemicals stored in the area. A metal shed to the north of the virgin product shed is used for the temporary storage of waste products pending their transfer to the Satellite Accumulation Center near Building 344. This storage area is paved with asphalt, and no secondary containment structures such as berms surround the shed. The waste product shed contains two flammable materials storage cabinets and two hazardous waste cabinets. Both sheds have cables connected to grounding rods for grounding drums of flammable materials. The open (eastern) portion of the fenced area is used for the storage of empty drums. The northeastern corner of the open fenced area is designated "flammables." Hazardous waste that was transported under manifest from Building 349 in 1989 included waste paint, waste acids, waste paint stripper, flammable paint-related materials, solid caustic soda, and waste dichloromethane solution.

According to Lockheed records, a "controlled" spill of water and alkaline caustic solution occurred at the hazardous material storage area on March 2, 1990. Lockheed Environmental Protection and Safety Organization (EPSO), Lockheed Fire Department, and Burbank Fire Department personnel responded to the scene. Approximately 20 to 30 gallons were discharged to the concrete floor within the bermed secondary containment area. Samples of the solution were collected and results showed the substance may have been alkaline solution from a wash tank in a process line in Building 353 with a pH of 10, and chemical concentrations of 320 mg/L sulfate, 0.5 mg/L total chromium, 120 mg/L chloride, and 3-4 mg/L fluoride. The area was washed down and neutralized, and a vacuum truck retrieved a total of approximately 250 gallons of the diluted solution. Reportedly, another spill occurred in the area in December 1988. An undetermined amount of Turco FF cleaning solvent, which contains methylene chloride, TCA, and MEK, spilled and was washed down by two pump trucks from the Fire Department. It is not known if the diluted solvent was retrieved. Fire Department records documenting this incident were not found.

The concrete pad that is located between the hazardous materials storage area and the security fence measures approximately 15 feet by 50 feet and was formerly used for staging aircraft. A grated trench to the east of the pad extends to the southwest and connects to the clarifier for Wash Rack Number 1, east of Building 345. Wash Rack Number 1 and its associated clarifier are discussed in more detail in the environmental assessment report for Parcel 1 of Plant B-6 (McLaren/Hart, 1991). An electrical vault box located on the sloped bank west of the hazardous materials storage area is connected to a utility trench that extends eastward into the storage area. The concrete pad and electrical utility trench were likely associated with the former blast fence N2, which was located on the sloped bank between Building 349 and Building 51.

The interior of Building 349 is used for painting. A paint spray booth is located in the southern portion of Building 349. The inside of the walls and roof of the booth are insulated with fiberglass. The paint spray booth originally had a wet wash filter system. Recirculated wash water was contained in a 40-foot by 13-foot by 4-foot deep, below-grade, grated, open-top concrete reservoir. Corfloat ST, an alkaline (pH 12.3 in a 5 percent solution with water) coagulant and anti-foaming agent with a silicate base, was added to the spray booth wash water. Reportedly, paint brushes were occasionally washed out in the wet wash reservoir. Overflow from the reservoir drained to a 1,500-gallon steel underground emergency overflow holding tank located outside the south wall of the facility. The wash water reservoir was emptied an estimated two to four times per year via a vacuum truck which parked near the roll-up door at the southeast corner of the building. The wet wash filter system was changed to a dry filter system in 1985. The wet wash reservoir was filled with sand and concrete, and the overflow pipe was capped in approximately 1985. The media for the dry filter system is changed as needed, depending on use, and the old filters are discarded to flammable materials dumpsters. Two vertical exhaust stacks discharge from the paint spray booth through the roof of Building 349. Air permits for the spray booth were obtained from SCAQMD on May 13, 1982 and are still current. The spray booth is still active.

A paint storage room and a paint mix room are located along the south wall of Building 349. A system of grated trenches to contain spills in the two rooms is located along the south wall. The trenches discharge to the 1,500-gallon holding tank described above. The paint storage room is bisected by a chain link fence which was recently added for product control. Products are stored on shelves and in a flammable materials storage cabinet in this explosion-proof room. The paint mix room is located east of the paint storage room. Formerly, quantities of paint up to five gallons at a time were mixed in this room. Currently, smaller quantities are mixed. A flammable materials storage cabinet is also located in the paint mix room. The room contains compressed air and water outlets. A sink is located on the south wall of the paint mix room over the grated trench. Reportedly paint brushes were formerly washed out in the sink, which discharged through a PVC pipe into the trenches and then into the 1,500-gallon holding tank outside Building 349. This

practice was stopped in approximately 1989. Presently, waste water from the sink is collected in a 5-gallon bucket, transferred to a 55-gallon drum, and transported to the SAC at Parcel 1 Building 344 for temporary storage pending off-site disposal as hazardous waste. There are no connections from this sink to the city sewer or storm drain systems. The floor trenches, associated plumbing and emergency underground holding tank are still in place. An alarm system to detect liquids overflowing to the emergency holding tank was installed in 1989. Reportedly no spills that discharged to the tank have occurred since that time.

The northern portion of Building 349 is an open area occupied by approximately seven work benches. Small parts, most less than 2-feet long, are prepared for painting in this area.

A gas-fired batch oven is located in the eastern portion of Building 349. Items which are painted in the booth are transferred to the batch oven for drying at approximately 150°F. The batch oven is permitted by the SCAQMD. The air permit was issued in 1982 and is still current. The oven doors previously had asbestos seals, which have been removed. The oven is insulated with Fiberfax, a spun ceramic material.

Electrical equipment in Buildings 349 and 353, and some electrical equipment in Building 352 are supported by a 4,500 square-foot electrical room abutting the east wall of Building 349. The electrical room contains two switch gear units and a 1,500-kVA dry-type transformer.

Paints and chemicals used in Building 349 have included lacquers, epoxy, epoxy enamel and epoxy primers, MEK, MIBK, TCA, toluene, xylene, alcohols, acids, caustic soda, paint strippers, solvents, and thinners. Components of these products, in addition to the volatile organic compounds named above that are used as neat products, include ammonia, benzene, chromates, glycol ethers, methylene chloride, petroleum hydrocarbons, phenol, and sodium salts.

4.17.3 Previous Investigations

Liquid from the wet wash reservoir (numbered Tank B-6-E in the 1984/1985 leak detection program) was sampled by Gregg and Associates in 1984 (Gregg, 1985a). The liquid contained 4.3 ppm acetone, 3.6 ppm MEK, 0.41 ppm barium, 0.40 ppm total chromium, 0.35 ppm zinc, and smaller amounts (<0.1 ppm) of cadmium, cobalt, copper, mercury, nickel, selenium and vanadium. The liquid had a pH of 9.19.

A soil boring was completed by Gregg and Associates during installation of a vapor monitoring well and suction lysimeter at the northwest corner of the wet wash reservoir (Gregg, 1985b). Soil samples from depths of 6 feet and 17 feet were collected and composited on April 25, 1985 and analyzed for CAM metals, pH, and

volatile organic compounds. The sample contained 109 ppm total chromium, 3.4 ppm cadmium, 2.1 ppm cobalt, 0.37 ppm mercury, background levels of six other metals, and a pH of 8.39. Volatile organics (EPA Methods 8010 and 8020) were not detected.

In 1989, ENSR conducted a leak detection investigation at the underground emergency overflow holding tank (ENSR, 1990b). The tank was designated B-6-E by ENSR, although the same designation had been used previously by Gregg and Associates for the wet wash reservoir inside Building 349. ENSR drilled three soil borings at tank B-6-E. Two soil samples from each boring were analyzed for total recoverable petroleum hydrocarbons and volatile organic compounds by methods 418.1 and 8240, respectively. Analytical results showed no chemicals above detection limits. A soil vapor survey was conducted by ENSR as part of the same investigation. According to ENSR, the chromatograms for analyses performed on soil gas samples taken from three vapor monitoring points at a depth of approximately three feet showed moderate levels of VOCs. The soil boring results from samples taken at depths of 10 feet or greater, indicate that the VOCs detected in the soil vapor survey were limited to near surface soils.

4.17.4 Site Inspection

Site inspections of Building 349 and nearby facilities were conducted in January and February 1991. A description of the inside and outside features is presented below.

4.17.4.1 Interior of Building 349

Approximately four hundred 1-pint containers and one hundred 1-gallon containers of lacquer, epoxy, and peelable coating were stored in the paint storage room in the southwest corner of Building 349 at the time of the site inspection. The flammable materials storage cabinet in the paint storage room contains 5-gallon containers of TCA and xylene. The floor of the paint mix room has minor staining from paint drips throughout. The staining also affects the northeast portion of the grated trench. The remainder of the trench is not stained. The concrete of the trench is in good condition with no cracks. The flammable materials storage cabinet in the paint mix room contains paint, hardener, and primer. Paint stains were noted east of the paint mix room and in the southeast corner of Building 349. No stains were noted elsewhere in Building 349. The lysimeter installed by Gregg and Associates was not noted in the vicinity of the paint spray booth.

4.17.4.2 Exterior of Building 349

Visual inspection of the area outside the door near the southeastern corner of Building 349 gave no indication that spills occurred during the pumping of the wet wash reservoir. Minor staining from paint drips was noted near the door at the southwestern corner of the building, extending south throughout the hazardous waste

product shed. Ring stains, apparently resulting from spills during transfer of waste to 55-gallon drums, were also noted in the waste product shed. The asphalt floor of the waste product storage shed has two cracks that cross the entire length and width of the area. The flammable materials storage cabinets in the waste product shed contain chemicals that are impounded because they do not have a material safety data sheet (MSDS). The hazardous waste storage cabinets in the same area contain two drums of waste paint and empty containers of isopropyl alcohol, MIBK, and Turco 6646.

An oily stain was noted in the yard between the waste product shed and the virgin product shed. Staining in this area may have resulted from ponding of runoff from the parking area to the east. The pavement southeast of the waste product shed and north of the virgin product shed has a rectangular cracked pattern approximately 6 feet by 12 feet that may reflect the location of a foundation for a former guard shack.

Drums stored in the virgin product shed at the time of the site inspection contained aliphatic hydrocarbon, caustic soda, hydrofluoric acid, nitric acid, sulfuric acid, polymer, oxidizer, Turco pretreatment, Turco 4215 NC-LT paint stripper, and Turco 5351 solvent. A total of twenty-six 55-gallon drums and eight 5-gallon drums were being stored. Rain water accumulation was noted against the berm in the western portion of the shed.

A total of 27 empty 55-gallon drums were stored in the open fenced portion of the hazardous materials storage area at the time of the site inspection. These included seven empty product drums, five empty salvage drums, nine new salvage drums, and six new waste drums. Nothing was stored in the designated flammables area in the northeast portion of the hazardous materials storage area at the time of the site inspection.

The concrete pad located south of the hazardous materials storage area is in good condition, with no significant stains. The asphalt pavement to the east of the pad, where the former temporary hazardous materials storage area was located, has a few small oil stains from parked automobiles, and the painted markings for "hazardous material" and "empty barrels" are visible. The grated trench at the southeastern end of the yard contains a couple of inches of sediment, but no significant staining was noted.

4.18 BUILDINGS 352, 352A, AND 352B

Buildings 352, 352A, and 352B are located at the northern boundary of Parcel 2, Plant B-6, as shown on Figure 4-1. These LADC (formerly ADP) buildings are referred to collectively as Building 352. General operations conducted in these facilities include small scale fabrication and metal forming.

Information on the historical and recent operations at Building 352 was obtained through interviews and site walks with Lockheed personnel Mr. George Abramson, Mr. Phil Aciena, Mr. Joe Giannone, Mr. Hans Kluewer, and Mr. Harley Waggoner. The following discussion is divided into construction details, previous operations and present use, and site inspection of each building area.

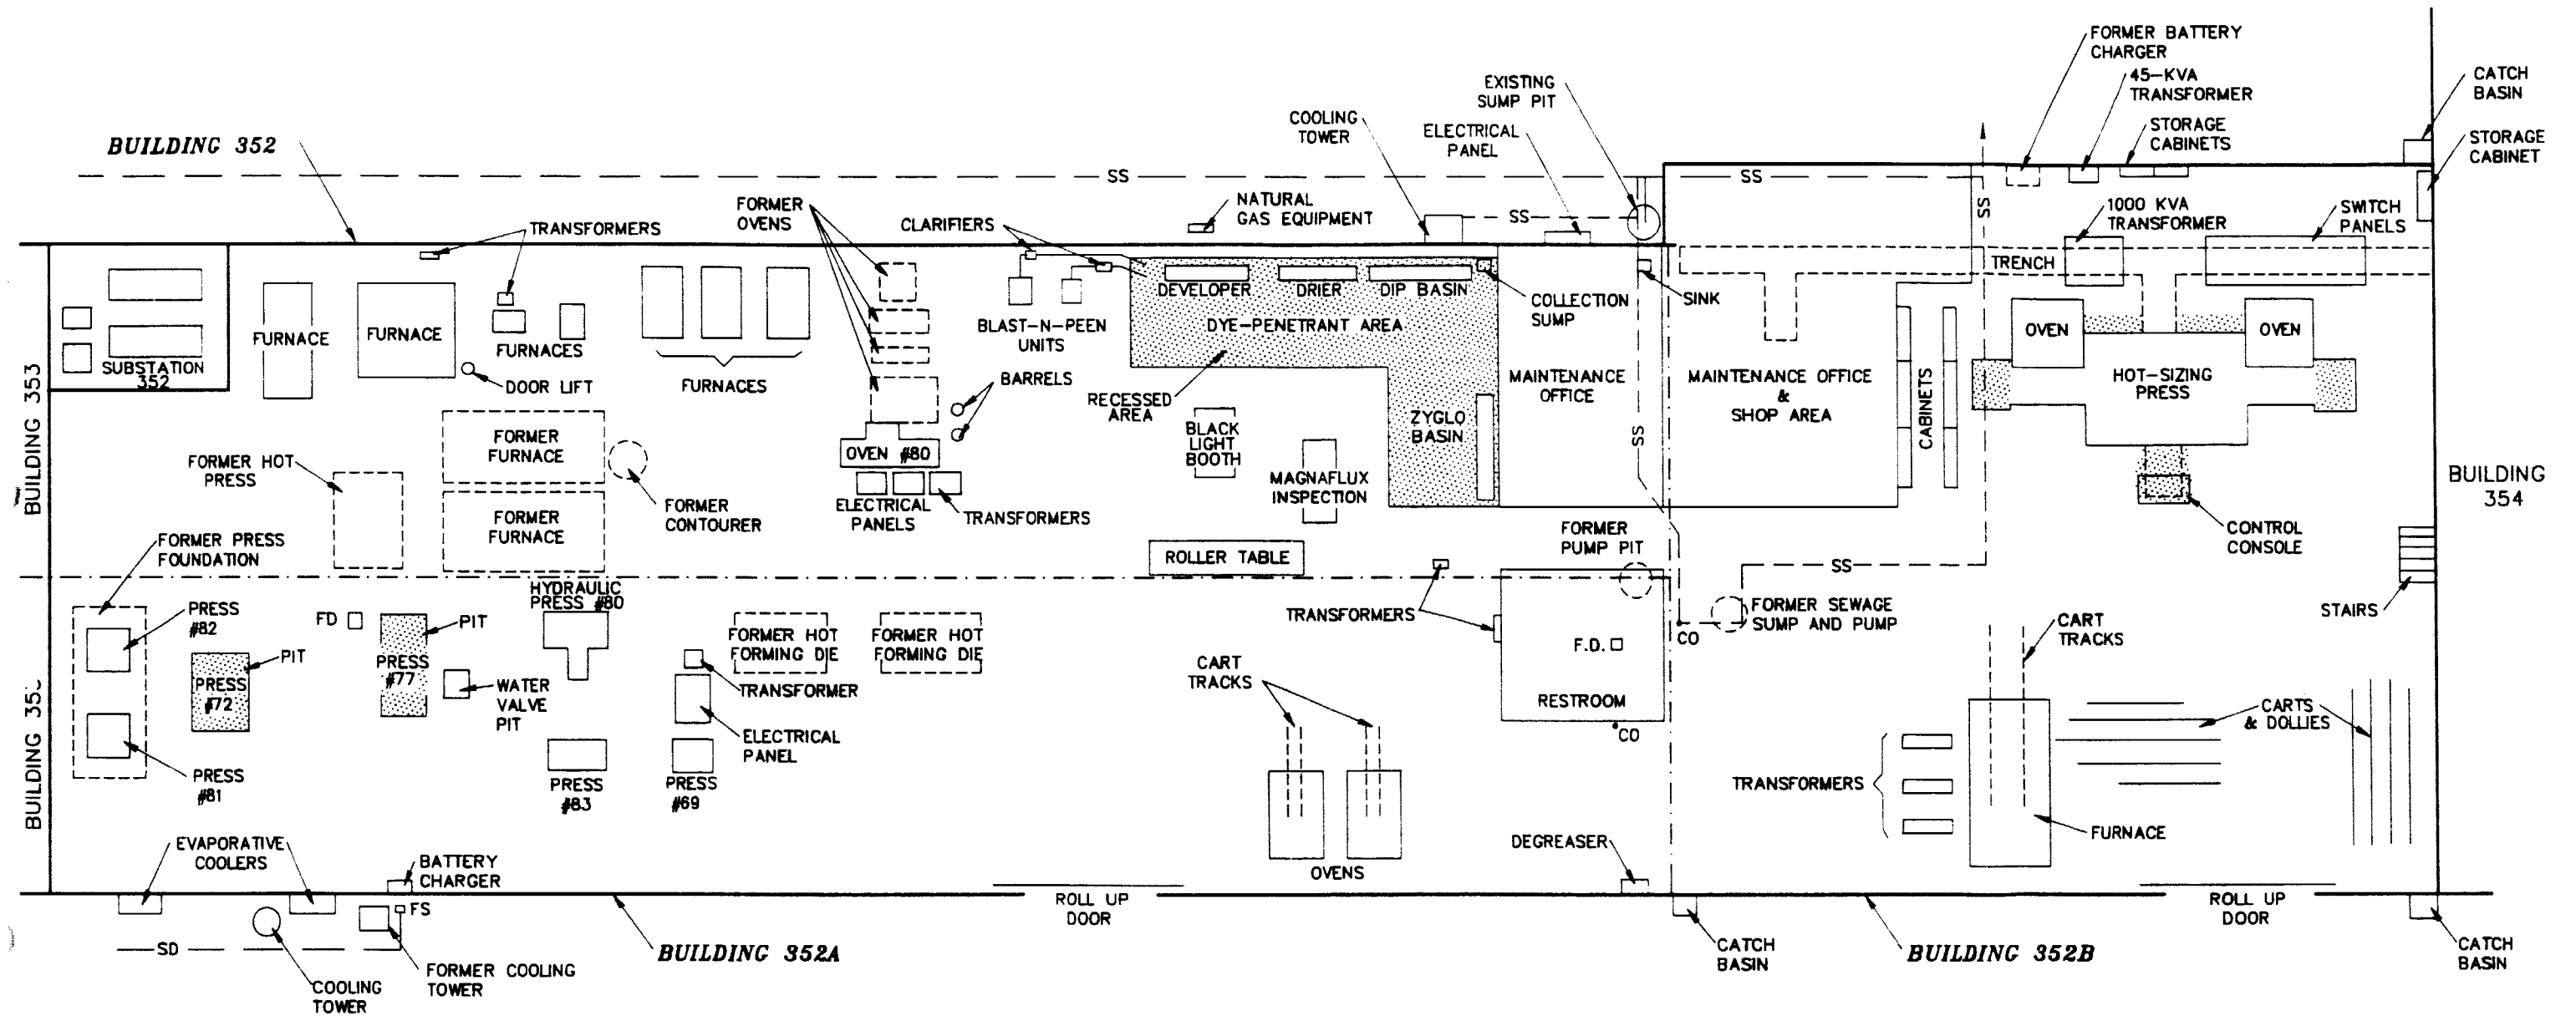

4.18.1 Construction Details

The original Building 352 comprised two, small, wood-framed sheds that were constructed in 1954, covering a 24-foot by 89-foot area. In 1957, these buildings were removed and replaced with a single Butler-type pre-fabricated steel-frame building (Building 352). Building 352A was annexed to the south side of Building 352 in 1962. Building 352B was annexed to the east side of Buildings 352 and 352A in 1963. Buildings 352 and 352A are 8,000-square-foot steel-frame Butler buildings. Building 352B covers approximately 8,750-square-feet and is also a Butler building. Construction materials include concrete floors, steel trusses, and corrugated sheet metal walls and roof. Open air vents are located in the roof. Lighting is supplied by incandescent fixtures. Figure 4-24 shows a plot plan of Building 352 and significant interior and exterior features.

A large containment basin was formed into the floor at the dye-penetrant area in the northeast part of Building 352 at the time the building was constructed. The floor of the dye-penetrant area is a spill containment pit that is recessed 3 inches below the surrounding floor level and is covered with wooden safety grating. A 2-foot wide by 2½-foot long by 6-inch deep concrete collection sump is located in the northeast corner of the recessed floor area.

There are three enclosed areas within Building 352: the rest rooms, the maintenance office, and the maintenance office and shop area. The partitions that enclose these three spaces are wood frame with either plaster board walls or wood sheeting walls. The partitions do not extend to the ceiling, they are approximately 8 feet high. These three enclosed areas are located at the point where the three buildings join, the eastern edge of Building 352, the northeastern corner of 352A, and the northwestern edge of 353B.

FIGURE 4-24
BUILDING 352, 352A, AND 352B
PLOT PLAN

LEGEND

- SS — SANITARY SEWER
- SD — STORM DRAIN
- FS FLOOR SINK
- CO CLEAN-OUT
- FD FLOOR DRAIN
- STAINING

The maintenance office includes an employee break area and wash sink. The office space is approximately 150 square feet. The walls are wood sheeting, the floors are covered with 9-inch floor tiles, and the ceiling is acoustic tile. The sink in the break room discharges to a sewage lift sump with a pump (located immediately north of the facility) which discharges to the sanitary sewer north of Building 352.

Building 352B construction drawings, dated 1963, show the relocation of a sewage sump and sump pump from outside of the east wall of Building 352A to its current location outside of the northeast corner of Building 352. The former sewage sump was referred to as a cesspool in another 1963 drawing.

The rest room at the eastern end of Building 352A is constructed of plastered wood-framed walls, and the concrete floor is covered with vinyl tiles. The rest room includes a floor drain and associated sewer clean-out. A dry-type 80-kVA transformer is located on the west exterior wall of the rest room. A pump pit with a two horsepower pump is shown on facility drawings dated 1957 in the southeast corner of Building 352, at the present location of the rest room. The purpose of the pit and associated pump is unknown.

Building 352B contains a large stationary hot-sizing press with two associated pre-heat ovens. An 18-inch deep, concrete-lined trench is located beneath the unit and houses hydraulic and electrical lines for the hot press. The trench extends east to the edge of the adjacent Building 354 and west through the maintenance office and shop to the edge of Building 352. The trench was extended to the west to provide for the future installation of a second large hot-sizing press. The second press was never installed.

An electrical substation, designated Substation 352, was originally located outside the west end of Building 352, within a cyclone fenced area. Building 352 was later expanded to the west to enclose the substation. According to 1960 facility drawings, Substation 352 contained two 750-kVA transformers. It is unknown whether this is the original equipment in the substation. A 1968 survey conducted by Lockheed indicated that Substation 352 contained two dry-type 750-kVA transformers. It currently contains similar equipment, however, the installation date of the equipment is not known. The 1968 survey identifies a 1,000-kVA dry-type transformer in Building 352B. According to facility drawings, the 1,000-kVA transformer was installed at the time of building construction in 1963 to provide power to the large stationary hot-sizing press.

4.18.2 Previous Operations and Present Use

The Building 352 complex was constructed as a sheet metal forming and heat treating facility and is referred to as the "Hot House" by Lockheed personnel because of the numerous hot presses, ovens, and furnaces operating in the structure (see

Figure 4-24). Although individual presses, ovens, and formers have been removed and/or replaced in the Building 352 complex, the original purpose and use of the facility has not changed significantly since its construction. Hot presses are used to form titanium parts and the furnaces and ovens are used for heat treating titanium and aluminum parts. Three small hydraulic presses for aluminum forming were present at the time of the site inspection, suggesting that there is very little aluminum forming currently done in Building 353. Dies fabricated in Building 354 are utilized within the Building 352 complex for the forming and heat treating operations. Metal sheets, which are received through the roll-up door located on the south side of the building, are heated in the furnaces and/or the pre-heat ovens and are pressed into the desired form in the hot-sizing presses. All ovens, furnaces, and hot presses in Building 352 are electrically heated. Once formed, the metal undergoes deburring and descaling processes through use of "blast-n-peen" units, and then the part is inspected for defects by dye-penetrant or magnaflux testing. This equipment is discussed in greater detail below. Finished pieces are then transported to other buildings within Plant B-6 for assembly, coating, painting, or additional treatment.

Facility drawings dated 1957 show multiple ovens and furnaces within the west end of Building 352 and one large mechanical shear and three lathes within the eastern portion of the building. In 1960, the equipment layout in the west end of Building 352 was modified: ten furnaces and seven ovens were located in the western and central portions of Building 352. A hydraulic contour former and two Sheridan Gray hot presses were located in the southwestern portion of Building 352 in 1960. The hot presses were moved to Building 353A in 1961. Currently, two large furnaces occupy the northwest corner of the building. One furnace is equipped with a hydraulic lift door, as shown on Figure 4-24. Five smaller furnaces are located along the north wall of Building 352. Oven #80 is located near the center of Building 352. Electrical switch panels and a small dry-type transformer are located directly south of oven #80.

Two "blast-n-peen" units and two associated glass bead clarifiers are located west of the dye-penetrant system. The blast-n-peen units are used to remove burrs and chips that may be present on formed titanium metal pieces. The blast-n-peen units consist of glass beads in a high pressure air-water mixture used to deburr the metal. Water, metal debris, and glass beads are channelled through the clarifiers, where metal and beads fall out of suspension. The effluent water from the clarifier discharges to the recessed floor of the dye-penetrant area.

The dye-penetrant area is used for inspection purposes to insure the integrity of aluminum and titanium parts formed in the Building 352 facility. Titanium parts make up approximately 80 percent of the materials inspected through this system. This area contains basins for developer, rinse dip, and "Zyglo" dye penetrant, and a hot air drier within the spill-containment pit that underlies the work area. The basins are made of steel and range in capacity from 250 to 500 gallons. The formed metal parts are occasionally cleaned with TCE-soaked rags prior to penetrant

inspection. A small volume of solvent, less than one quart, is stored in the work area. It is not known how the rags were disposed. However, used rags are typically disposed in metal safety cans at Plant B-6. The contents of the cans are transferred to a large metal bin when the cans are filled, and the rags are disposed off-site as hazardous waste. The parts are immersed in a fluorescent penetrant oil, having a common name of Zyglo (components include aliphatic hydrocarbons, terpeneol, and fluorescent dyes), and then are removed from the oil to sit for a prescribed "dwell time." The parts are then rinsed with water in the dip basin to remove any residues and dried in an electric hot air drier. The dried parts are dusted over the developer basin with ZP-4B dry developer powder (major components include magnesium carbonate and calcium phosphate) that develops any penetrant that infiltrated a defect. The parts are then inspected in a curtained booth under a "black" (ultraviolet) light that illuminates any remaining penetrant. Any fluids that may spill out of the basins or that are discharged by the blast-n-peen units are contained in the shallow recessed floor of the dye-penetrant area. These fluids then drain into a 6-inch deep collection sump located at the northeast corner of the recessed floor. The collection sump discharge point is unknown; however, it may be plumbed directly to the sump pump and sanitary sewer located north of the facility.

In summary, the sump located outside the northeast corner of the Building 352 reportedly, at one time, received effluent from a drain and floor sink in the eastern portion of Building 352A and from the dye-penetrant system, the blast-n-peen system, and the sink in the maintenance office in Building 352. It is unknown whether this sump continues to receive effluent from these sources.

A magnaflux inspection area is used in place of the dye-penetrant system to inspect steel and some stainless steel parts for defects. The magnaflux apparatus utilizes a magnetically and electrically charged table. The process induces magnetism by passing current through the part being tested. Kerosene that contains fluorescent iron oxide particles is applied to the part while the part is being magnetized. A magnetized part normally has induced north and south poles, while a crack, fracture or defect in the part creates a new set of magnetic poles. The iron oxide adheres to the new set of poles, and the collection of particles is detected under the black light. The part is demagnetized after it passes inspection and is checked with a Gauss meter to insure that no residual magnetism remains. It is not known how the kerosene was applied, removed or disposed. Chemicals used in the dye-penetrant system and the magnaflux system are stored in the virgin product hazardous materials storage facility located south of Building 349.

There are two hot presses (#81 and #82) located in the southwest corner of Building 352A. A single large Sheridan Gray press was located in this area from 1962 through 1980. Both press #81 and #82 use no hydraulics but are electrically powered and heated. Reportedly, press #82 has never been used. A third electrically heated hydraulic hot press (#72) is located directly east of press #82 and is mounted in a 7-foot wide by 10-foot long by 10-inch deep concrete pit which

catches leaking hydraulic fluid. Hot press #77 is located east of press #72. This press contains a 100-gallon hydraulic fluid reservoir, and there is a 6-foot wide by 13-foot long by 8-inch deep concrete oil collection pit beneath the unit. The press itself is mounted at floor level on a large isolation pad within the pit. Hydraulic press #80 is mounted just east of #77. It has no sump or oil collection pit. Two pneumatically-powered box presses (#69 and #83) are located south of the hydraulic press. An associated electrical control panel and 35-kVA dry-type transformer are located near press #69. Two hot forming dies were located in this area in the past and both had self-contained vacuum tables. They were removed in approximately 1980. A Cyril Bath former, shown on a 1964 facility drawing, was removed in 1981 from the southeastern portion of Building 352A. Two electric ovens are currently located in this area. Equipment cart tracks lead into the heating chamber of each oven. A 25-ton radial draw former was located in the eastern portion of Building 352A in 1962, but has since been removed.

A mobile battery charger is located near the southwest corner of Building 352A and is used to recharge the electrically powered carts used in the facility. The carts are used to transport heavy materials throughout the facility.

A recently installed free-standing degreaser is located against the southern interior wall of Building 352A. The degreaser tank has a 20-gallon capacity and does not include a drain. The degreaser is reportedly used for cleaning small metal parts and dies with non-chlorinated solvents, including a product called Bio T Max. Some solvents for the degreaser are stored in a fire retardant cabinet within Building 352A. Two 55-gallon barrels of Bio T Max are stored near the dye-penetrant system and blast-n-peen units. Bio T Max was first used within the facility in January 1991 as a non-hazardous degreaser. Bio T Max contains natural terpene and non-ionic surfactants. A material safety data sheet (MSDS) for Bio T Max states that it contains no hazardous components as defined by OSHA regulations and guidelines.

The maintenance office and shop area in Building 352B is used to support the equipment and operations in the Building 352 complex. This area contains two work benches and small, floor-mounted equipment including a grinder, band saw, drill press, and wheel sander. Metal storage racks occupy the northern portion of the maintenance shop area. Minor repairs involving grinding, welding, electrical wiring, soldering, and drilling are conducted in the shop area. A majority of the space is, however, used for storage of spare parts for the furnaces, ovens, and presses located in the facility. Chemical use is minimal in the shop area.

The large hot-sizing press that is located in Building 352B is used to form titanium parts and has the capacity to heat two parts simultaneously, in the pre-heat ovens on either side of the press. The press is operated hydraulically and heated electrically. The sizing press contains an approximately 300-gallon hydraulic fluid reservoir. The sizing press is operated via a control console on the south end of the unit. A 1,000-kVA transformer for the press and ovens is located on its north side. Switch

panels and equipment breaker panels are stationed to the east of the transformer. A metal releasing agent, Everlube T-50 (containing toluene and graphite), is used to aid in removal of the formed piece from the hot-sizing press.

A large floor-mounted furnace is located within the southern portion of Building 352B and includes a set of cart tracks that enter the heating chamber. This furnace is used to pre-heat titanium materials prior to final heat treatment in the sizing press. Fiberfax, a synthetic insulator made of spun ceramic material (aluminosilicate), is typically wrapped around heated parts to minimize heat loss prior to heat finish operations. According to the manufacturer's MSDS, fiberfax contains no asbestos fibers.

Furnaces, ovens, and machine pits in Building 352, which accumulate residues, oils, and fluids, are vacuumed out by maintenance personnel on an as-needed basis. These waste fluids are then transported to the Satellite Accumulation Center (SAC), presently located within the Building 342 and 344 revetment area on Parcel 1 of Plant B-6, for temporary storage prior to their disposal or recycling off-site.

Substation 352 supports electrical equipment in Building 349, the Building 352 complex, the Building 353 complex, and Building 354. Smaller individual electrical panels and associated transformers are dedicated to specific equipment located throughout the Building 352 facility.

A water cooling tower, which provides cooling water for the hot presses and ovens in Building 352A and 353A, is located outside the south wall of Building 352A. The high efficiency unit replaced an older and is used to cool bearings in the hot presses and heating coils in ovens using a closed-loop system. Condensate from this tower is discharged to an existing floor sink located east of the abandoned cooling tower. This floor sink drains to the storm drain system via a two-inch diameter waste line located south of the facility. The cooling towers reportedly have used no biocides or chlorofluorocarbon (CFC) refrigerants. The old cooling tower, which is located just east of the operating tower, was disconnected in 1989.

An additional water cooling tower, similar to the abandoned cooling tower on the southern exterior wall, was installed in approximately 1968 on the north side of Building 352. The tower cools water from ovens and furnaces in Building 352 and uses a closed-loop system with no biocides or CFC refrigerants. Condensate from this tower drains to the sump at the northeast corner of Building 352.

4.18.3 Site Inspection

A description of the features observed inside Building 352 at the time of the site inspection is presented below, followed by a discussion of the exterior of Building 352.

Interior

Two large furnaces are present along the north wall in the western end of Building 352. The floor is slightly oil stained beneath the hinge of the hydraulic door of the eastern furnace. Five smaller furnaces and associated dry-type transformers are located east of these large furnaces. The doors of these furnaces appeared to be lined with asbestos-containing materials. No stains are visible beneath these furnaces. No evidence of the four former ovens in this area was noted during the site inspection. Oven #80 appeared to be in good condition and no stains were noted in association with its operation. No evidence of the previously removed hot press, two large furnaces, and contour former, shown on Figure 4-24, was visible during the site inspection. No stains were noted in these areas.

The blast-n-peen units that are located near the north interior wall of the facility are in fair condition. Fine particles, perhaps glass bead fragments, were noted beneath the units. No stains were noted in this area. The clarifiers for the units contained sand, glass, and metal dusts. No oils were visible within the clarifiers.

No indication of significant current use of the dye-penetrant system was evident at the time of the site inspection. The 3-inch deep recessed concrete floor of the dye-penetrant area is slightly stained green from the fluorescent Zyglo fluid. The concrete appeared to be in good condition with no major cracks or fractures. The collection sump contained approximately 2 inches of fluorescent fluid at the time of the site inspection. The developer basin was dry and appears not to have been recently used. The drier was in good operating condition. The 500-gallon dip basin contained a minor amount water, and the basin was in good condition. The Zyglo dip basin contained 18 inches of fluorescent green dye-penetrant solution at the time of the inspection. No cracks or fractures were noted in the basin. No stains were noted on the concrete floor at the black light inspection booth or the magnaflux inspection table located near the dye-penetrant area. A roller table is located south of the booth, and it appears to be associated with the dye-penetrant operation.

Press #81, located within Building 352A, uses no hydraulics and appeared to be in good condition, with no stains associated with its operation. No stains were evident near press #82. The former press foundation that was noted north of press #77 in a 1962 facility drawing was not visible during the site walk.

Approximately two inches of oily residue were present within the ten-inch deep concrete pit located beneath press #72. The pit was in good condition. The concrete pit beneath press #77 contained 1/4 inch of oil, and some minor staining was noted on the concrete floor near the press. Minor oil staining was observed at hydraulic press #80 and box press #69. No oil staining was noted near press #83. No evidence of the former hot forming dies was observed. The two ovens in the southeastern portion of Building 352A appeared to be undergoing asbestos removal during the site inspection. No stains were noted on the floor near the ovens.

No stains were noted near the battery charger located at the south wall of the facility. No significant stains were noted on the floor near the maintenance degreaser.

The rest room at the east end of Building 352A is in good condition with no floor stains. The former pump pit is visible beneath the north wall of the rest room. The lid of the pit could not be opened because of the overlying rest room wall. A 1½-inch diameter steel pipe was noted along the exterior wall of the rest room entering the lid of the pit. Its purpose is unknown.

The large hot-sizing press and associated pre-heat ovens occupy much of the northern portion of Building 352B. The concrete utility trench beneath the hot-sizing press contained approximately three to seven inches of hydraulic fluid at the time of the site inspection. Puddles of fluid were noted on the concrete floor near the east and west ends of the press, beneath the control console, and along the northern perimeter of the press. The trench appears to be in good to fair condition with no visible major cracks or fractures.

The floor of the maintenance shop in Building 352B has minor staining from oils and greases. No major fractures or cracks in the floor were noted. No significant stains were noted in association with the mechanical equipment in this area. The storage area contains metal racks and spare parts. No significant stains are visible in the storage area. The electrical utility trench in the maintenance area is dry and free of staining. No stains were noted in the office area.

No stains were noted near the 1,000-kVA transformer, 45-kVA transformer, or the electrical switch panels located north of the press in Building 352B. Two metal storage cabinets, located against the northern wall of the building, house spare electronic equipment and tools. Another metal storage cabinet, located near the northeast corner of the room, holds metal rods and clips, apparently for use with the hot-sizing press. No staining is visible at these storage cabinets. A battery charger was formerly stationed near a small electrical control panel located west of the 45-kVA transformer. No significant staining was noted at this location.

Six metal storage cabinets are located west of the hot-sizing press. These cabinets contain spare press parts, hoses, miscellaneous dies, clips, wire, and nuts and bolts. No significant stains were noted in the area around the storage cabinets.

An oily stain of approximately 6 square-feet in the area was noted on the west side of the furnace in Building 352B. No stains are visible on the floor near the three dry-type transformers, located directly west of the furnace.

Approximately 20 carts and table dollies are located in the southeast portion of Building 352B. Items noted on the carts and dollies included lead weights, dies, pipes, templates, forms, and fans. No stains were noted on the floor beneath these materials.

No stains were noted near the two 750-kVA transformers in Substation 352, and the transformers appear to be in good working condition.

Exterior

The water cooling tower outside of the southern wall on the western end of the building is operating and appears to be well maintained. No evidence of leaks or stains were noted. The older cooling tower to the east appears to be abandoned and is partially dismantled. A floor sink, located just east of the abandoned cooling tower, collects condensate discharge from the operating cooling tower. The floor sink is in good condition, and no staining is visible near the drain. Two wall-mounted evaporative space coolers are also located on the south side of Building 352A. Condensate generated by the evaporative coolers discharges to the asphalt pavement. No unusual staining was noted near the evaporative coolers.

The asphalt in the yard south of the Building 352 complex is in good to fair condition and appears to be recently paved. No significant stains were noted in the yard, other than isolated areas of automobile oil stains. Silt deposits were noted surrounding a catch basin near the southeast corner of Building 352B.

The sump outside of the northeast corner of Building 352 contains sediment. No significant staining was observed in or near the sump.

An electrical panel and natural gas valving and pressure regulation equipment that are located on the north side of the facility are reportedly abandoned and have not been used in many years. The former use of this equipment is unknown. The water cooling tower on the north side of the building is currently operating. Condensate lines from the cooling tower empty into the sewage sump pump pit that is approximately 20-feet east of the tower. No significant stains were noted in association with the cooling tower. No stains were noted near the electrical panel or the sump pump.

4.19 BUILDING 353

Building 353 is located within the LADC area of Plant B-6 near the northwestern corner of Parcel 2, as shown on Figure 4-1. A floor plan for Building 353 is shown on Figure 4-25.

Information on the present and historical use of Building 353 was obtained through interviews and site walks with the following Lockheed personnel: Mr. George Abramson, Mr. Joe Giannone, Mr. Ted Melvin, Mr. Robert Miland, Mr. Bill Robinson, and Mr. Al Weaver. Discussions of the building construction details, previous operations and present use, previous investigations, and site inspection are presented below.

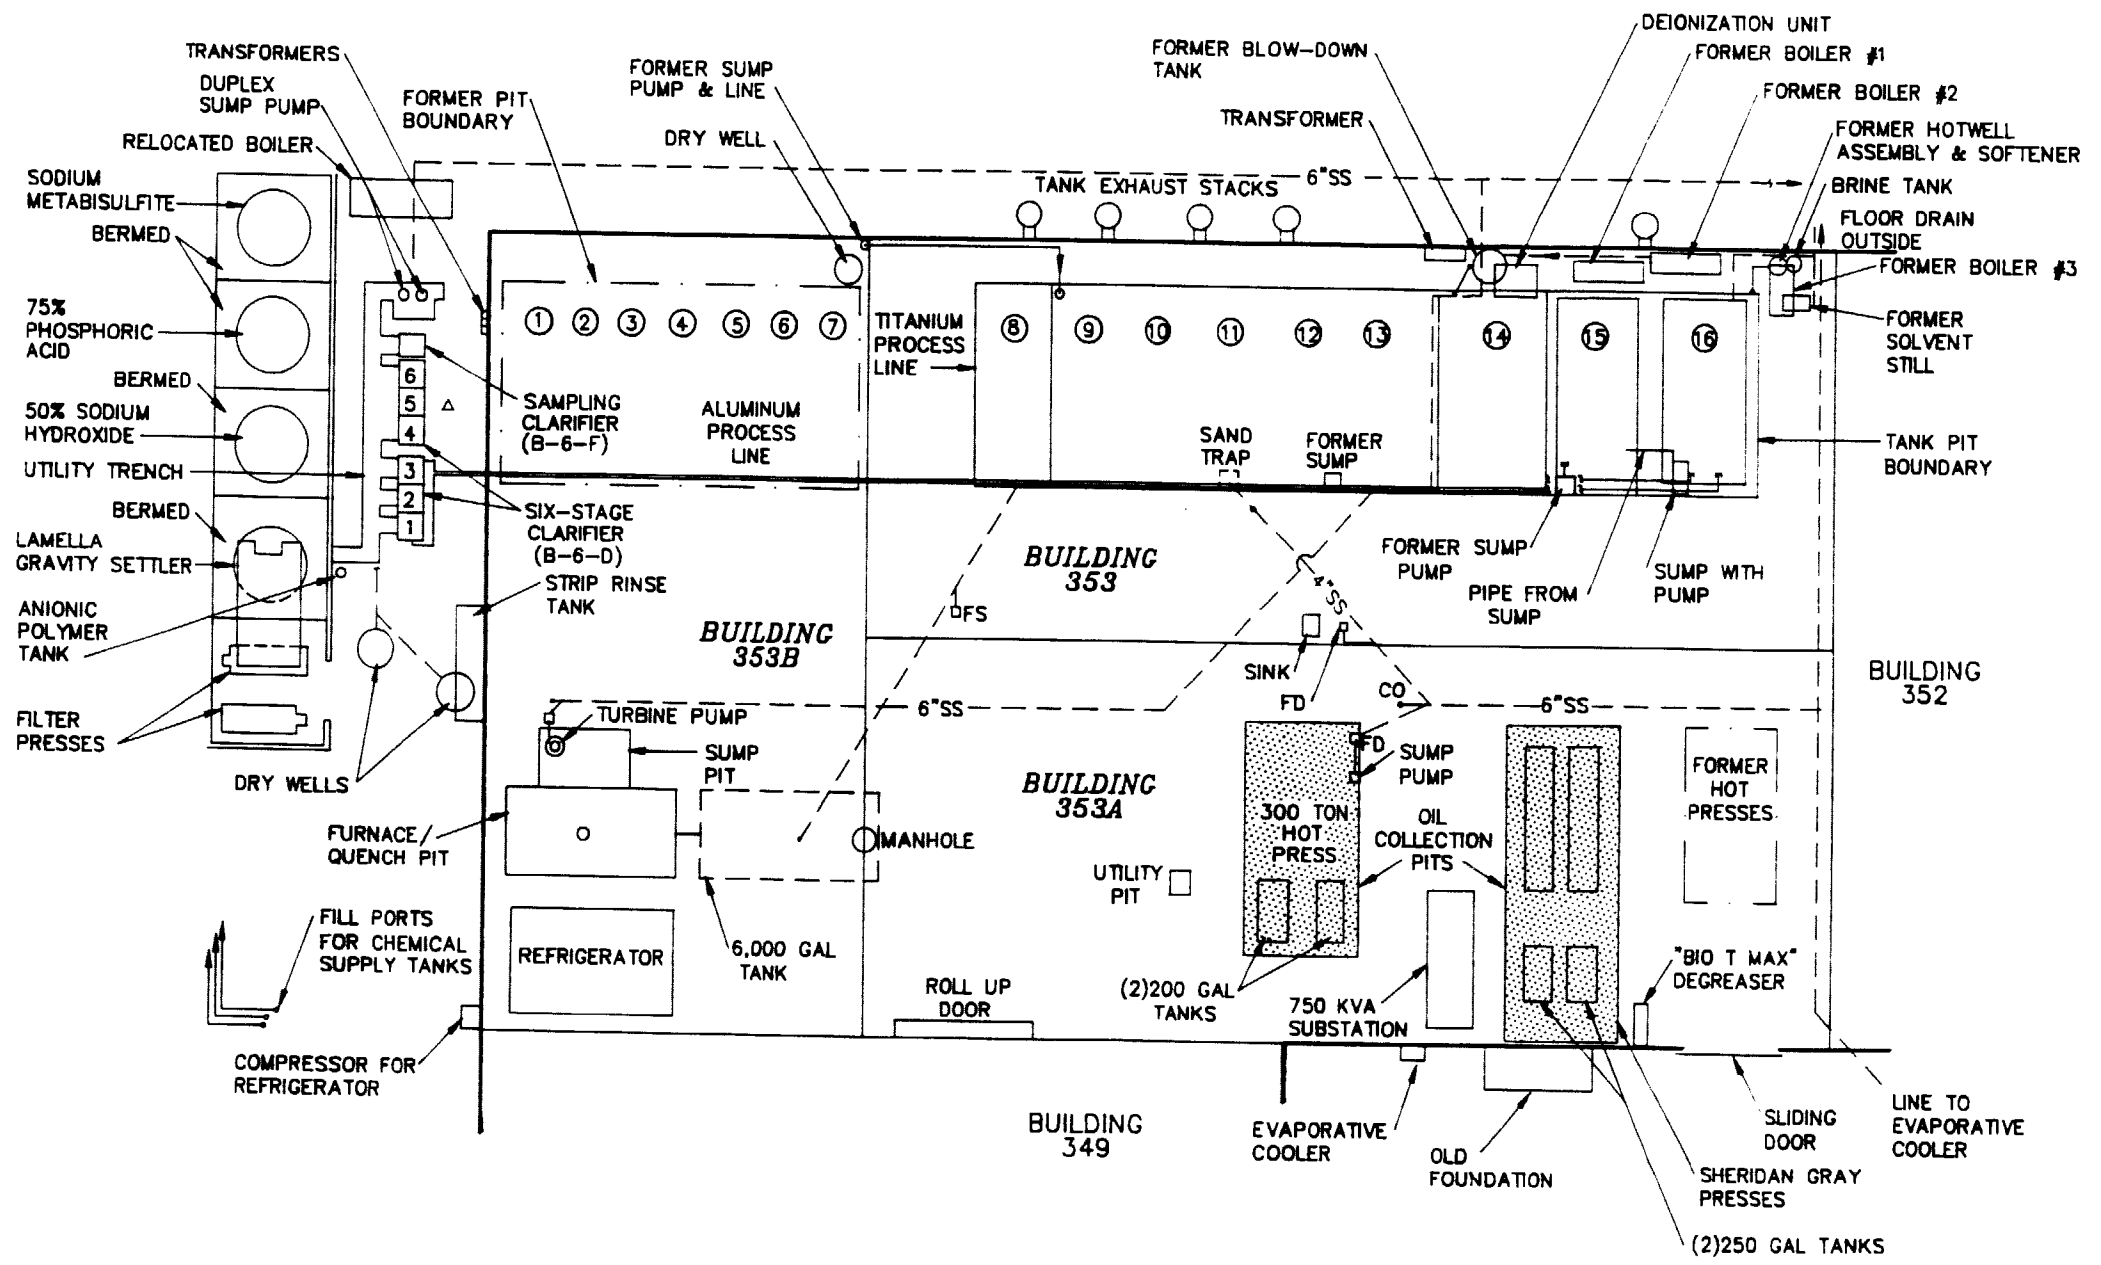

4.19.1 Construction Details

Building 353 is a one-story structure located north of and adjacent to Building 349. It is composed of three adjoining structures, formerly known as Buildings 353, 353A and 353B. These three buildings along with Buildings 352, 352A, and 352B, which are adjoining to the east, are now referred to collectively as Building 352. Buildings 352, 352A, and 352B are presented in Section 4.18. Construction materials for Building 353 consist of steel trusses and girts, corrugated metal walls, and a concrete slab floor. The building has a wall-mounted evaporative cooler on the south wall and ceiling-mounted gas unit heaters. Lighting in Building 353 is mostly fluorescent, with a few incandescent fixtures inside and incandescent floodlights outside. A 750-kVA dry-type transformer is located in the southeastern portion of the building, and smaller dry-type transformers are located along the north wall and outside the northwest corner of the building. A corrugated sheet metal covered area is located outside the northwest end of Building 353.

Building 353 contains two metal process lines for aluminum and titanium and a vapor degreaser in the northern portion of the building. The stainless steel aboveground tanks for the process lines and degreaser are underlain by concrete containment pits. A facility drawing dated 1963 indicated that the sides and floor of the containment pits are six-inch thick reinforced concrete.

A six-stage reinforced concrete clarifier (B-6-F) for pre-disposal treatment of the metal process line rinsewater is located outside the west end of Building 353. All of the sections of the clarifier are sealed with epoxy resin. Three 6,000-gallon chemical supply tanks for the clarifier, which contain sodium metabisulfite, 75 percent phosphoric acid, and 50 percent sodium hydroxide, are located in a bermed area west of the clarifier. A gravity settler, anionic polymer supply, and two filter presses are

BGPAA 025597

located along a retaining wall west of the covered area outside Building 353. The bermed area for this equipment is coated with resin. A concrete-lined utility trench between the tanks and the clarifier contains chemical feed lines and electrical lines for the wastewater pretreatment system. Transfer lines between the process tanks and the clarifier are mounted on the walls of the containment pits.

Oil collection pits for hot presses in the southeastern portion of the building are one- to two-feet deep with six-inch thick reinforced concrete sides and bottom. A pit for a quench furnace was constructed in 1977 in the western part of the Building 353B. The pit is 10-feet deep with 10-inch thick, reinforced concrete sides and a 9-inch thick, reinforced concrete floor.

4.19.2 Previous Operations and Present Use

Building 353 has been used since its construction for the processing of metal parts for aircraft, especially aluminum and titanium. The equipment in the building, including process lines, degreasers, hot presses, a furnace with quench pit, and a refrigerator, are all associated with the forming and finishing of metal prior to painting and assembly. Buildings 353, 353A, and 353B, which function as a single unit, were built in 1960, 1961, and 1963, respectively. The pretreatment clarifier located west of the building was designed and built in the early 1980s.

The original Building 353, which occupies the northeastern portion of the building, as shown on Figure 4-25, was built in 1960 as a metal processing facility. A facility drawing dated 1960 shows a large, concrete, tank containment pit in the center of the building and a smaller tank containment pit within the eastern third of the facility. The process tanks located in the containment pits included the following: four pickling tanks and three water rinse tanks (two cold water rinse and one hot water rinse) in the central pit and a degreaser tank in the eastern pit. A sump pump in the eastern pit transferred spilled fluids, if any, to the central pit. The plumbing was reportedly altered in 1981 so that there is currently no discharge from the eastern pit. Any spills to the eastern pit would be removed by a licensed operator using a vacuum truck and be disposed off-site as hazardous waste. Effluent from the central pit drained to a sand trap, shown on Figure 4-25, that discharged southeastward to the sanitary sewer. A floor drain located along the south wall of Building 353 discharged to the same sewer line. It is unknown what operations may have discharged to this floor drain in the past. A sink for hand-washing is currently located adjacent to this floor drain. A floor sink located south of the southwest corner of the central pit discharged to the containment pit. It is unknown what operations may have discharged to this floor sink.

Also shown on the facility drawings were a boiler (Former Boiler #2 on Figure 4-25), a blow-down tank for the boiler, a hot well assembly, and a brine tank located along the north inside wall. Industrial water was conditioned through the brine tank and softener and then fed through the hot well assembly to the natural gas-fired boiler.

The boiler was used to generate steam for processes in the building, including vapor degreasing and hot water rinsing. Boiler blow-down water was discharged to the blown-down tank, which discharged to the sanitary sewer through the central containment pit in Building 353. Boilers have occupied three locations near the northeast corner of the titanium process line in Building 353. The boiler that is currently used has been located in the covered area west of the building, along with the blow-down tank, since 1985. The hot well assembly is no longer present in Building 353, and the brine tank is present but is no longer used. Any backwash water from the water conditioning units, and drainage from the hot well assembly, discharged to the eastern containment pit.

According to facility drawings dated 1963, alterations were made to the tank containment pits. The new process tank configuration included a salt bath tank, three acid tanks, a spray rinse tank, and a drying oven. The 1963 drawings also show the addition of a 12-inch by 12-inch by 12-inch deep sump in the central pit. It is unknown what this sump discharged to. In 1969, an iridite tank and an etch tank were added outside the east end of the eastern tank pit. In approximately 1979, the two separate tank pits in Building 353, which underwent multiple alterations and plumbing relocations, were combined to form a single pit.

The process line in the original portion of Building 353 is currently used for titanium cleaning. The titanium is descaled in an Alko solution containing caustic soda and sodium nitrate, an alkaline cleaner containing sodium hydroxide, and a nitric acid-hydrofluoric acid pickle solution. The process line also includes two water rinse tanks and a hot air drier. Waste rinse water is piped to the pretreatment system west of the building and then discharged to the sewer. Any spills to the underlying containment pit would be vacuumed and disposed off-site as hazardous waste, as described above.

Process line exhaust stacks, and their electric fans, are located in a walkway outside the north wall of Building 353. According to a facilities drawing dated 1960, these exhaust stacks vented four pickle tanks and the vapor degreaser. Two of the exhausts are currently connected to the Alko tank and the pickle tank on the titanium process line. The remainder are connected to equipment in the aluminum process line in Building 353B, discussed below.

A 225-gallon, steam-heated, water-cooled, solvent still was included in the tank line in 1979. According to a permit to operate from the SCAQMD dated January 1982, a vapor degreaser associated with the solvent still was permitted to use TCA, CFC-113 and/or methylene chloride. The permit was renewed yearly. A SCAQMD permit dated March 1990 for the solvent still stated that the use was for the distillation of TCA. The vapor degreaser still occupies the eastern pit and it currently uses TCA as the cleaning solvent. The associated solvent still is reportedly no longer connected to the degreaser and is not used. TCA is changed out of the degreaser when it no longer meets specifications. The spent TCA is pumped into 55-

gallon drums and transported off-site as hazardous waste. The degreaser is cleaned and refilled with TCA from 55-gallon drums. The virgin TCA is stored in the hazardous materials storage area south of Building 349. Reportedly, a fluoride-phosphate detergent degreaser was used in this location for approximately two to four years prior to the installation of the vapor degreaser.

In 1961, Building 353A was annexed onto the south wall of Building 353. Sheridan Gray hot presses are located in the southeastern portion of the building. The Sheridan Gray hot presses have two 250-gallon hydraulic oil tanks. In 1961, additional hot presses were relocated from Building 352 to a location east of the Sheridan Gray presses, but they are no longer present in Building 353A. It is not known when these presses were removed from Building 353A. A facility drawing dated 1961 shows the addition of another hot press in the center of Building 353A. This 300-ton press for sizing titanium is electrically heated and is insulated with spun ceramic material. It has two 200-gallon hydraulic oil tanks, each with a cooling unit and fan. The industrial water that is used in the non-contact heat exchangers of the cooling units discharges to a floor drain that is connected to the sanitary sewer. The floor drain also receives effluent from a sump pump that drains the floor of the hot press oil collection pit. The 1961 drawing indicates that an exhaust stack above the hot press contained asbestos filter cloth within the ducting. The large dry-type transformer in this area serves the presses. A degreaser is located near the southeastern corner of the Sheridan Hot press area. The degreaser contains approximately eight-gallons of the cleanser "Bio T Max" and has been in use for cleaning small metal parts since 1990. As described above in the discussion of Building 352 (Section 4.18), Bio T Max contains no hazardous constituents, according to its MSDS.

Building 353B was annexed to the west ends of Buildings 353 and 353A in 1963. This prefabricated Butler building initially included one large tank containment pit, which included two soap tanks, one spray rinse tank, one acid tank, and one drying oven. Fluids from the pit were transferred to the central pit in Building 353 through a sump pump located in the northeast corner of Building 353B, and then to the sanitary sewer. The sump pump has been removed, and fluids are currently pumped out of the containment pit by a licensed contractor. A dry well was noted on facility drawings near the former sump pump. The purpose of the dry well is not known.

The tank containment pit in Building 353B currently contains an alodine process line for chemical filming of aluminum. Process tanks include alkaline cleaner (major components include sodium tetraborate and sodium tripolyphosphate), alkaline etch (sodium hydroxide and sodium gluconate), a water rinse tank, deoxidizer (Oakite 34 - major components include sodium bisulfate, chromic oxide, potassium dichromate, sodium dichromate, and sodium silicofluoride), chemical film (Alodine 1000 - major components include chromic acid, sodium fluoride, potassium fluorozirconate, potassium fluoroborate, and potassium ferrocyanide), a deionized water immersion rinse tank, and a hot air drier. The alkaline etch, deoxidizer, and chemical film tanks

and the hot air drier from the alodine process line are vented to the outside of the building. The deionization unit for the immersion rinse tank is located in the area of Building 353 north of the titanium pickle overflow tank.

In approximately 1977, a large electric furnace and quench pit were constructed in the southern portion of Building 353B for treating aluminum to increase its malleability. The 10-foot deep quench pit is located immediately beneath the furnace. Aluminum is heated in the furnace after being treated with ammonium fluoroborate to prevent discoloration. After heating, the aluminum is quickly lowered by a pneumatically-powered elevator shaft into the quench pit. Water is delivered from a 6,000-gallon underground holding tank to a sump pit and 40-hp turbine pump that feeds the quench pit and overlying quench spray nozzles in a closed-loop system. A sump pump at the northwest corner of the sump pit discharges excess water to the sanitary sewer, and a 6-inch overflow drain line from the 6,000-gallon tank discharges to the central tank containment pit in Building 353, as shown on Figure 4-25. After quench treatment, the aluminum is stored in a refrigerator, which is located south of the furnace, to retain its malleability. Some of the insulation strips on the quick quench furnace reportedly contain asbestos.

The industrial waste water pretreatment facility treats rinse waters discharged from the process lines in Building 353 prior to their discharge to the City of Burbank sanitary sewer system. The facility is located in the covered area outside the west wall of Building 353B (see Figure 4-25). Evidence of the industrial waste water treatment area was first shown in a 1980 design drawing. The facility, consisting of a six-stage clarifier, associated plumbing and sump pump, and a sampling clarifier, reportedly began operation in January 1985. The clarifier is used for neutralization, chrome reduction and precipitation, sludge removal by filtration, and total dissolved solids (TDS) reduction. Prior to its installation, waste rinse water from the process lines in Building 353 was reportedly discharged to the sewer after neutralization with anhydrous ammonia.

Schematic flow diagrams for the wastewater pretreatment facility show that the rinse effluents from the processing tanks in Building 353 enter the six-stage clarifier (B-6-F) at either Stage #1 or #3. The acidic rinses entering Stage #1 contain hexavalent chromium and must be adjusted to a pH of 3.0 with phosphoric acid before being reduced to trivalent chromium with sodium metabisulfite solution. The treated rinse water flows through Stage #2 (for dwell time) and into Stage #3, where it is partially neutralized by the incoming alkaline process rinses. The rinse water then flows into Stage #4, where it is completely neutralized and adjusted to pH 8.2-8.4 with 50% caustic soda solution. When the flow reaches Stage #5, it is pumped to the Lamella Gravity Settler, where the precipitated chromium and other metallic hydroxides are separated from the rinse water with the aid of an anionic polymer settling agent. The precipitated sludge flows to a sludge settling tank located beneath the Lamella Gravity Settler. The supernatant flows by gravity to Stage #6, where any necessary pH adjustments can be made. Effluent from

Stage #6 enters a sampling clarifier prior to its discharge to the city sewer system via two sump pumps at the north end of the clarifier. The precipitated sludge is pumped from the sludge settling tank through two JWI Filter Presses prior to its removal and transportation by a licensed hauler to a Class I landfill. The filtrate is returned to the system at Stage #3.

The waste water pretreatment clarifier is monitored for leakage by a suction lysimeter that is located immediately east of the clarifier. According to a permit variance request, the volume of rinse water varies between 12,000 and 20,000 gallons per day, and total chromium content averages 4 mg/l before treatment.

Two 4-foot diameter by 10-foot deep dry wells are shown in drawings dated 1982 near the west outside wall of Building 353B. The dry wells, which are located south of the clarifier, reportedly received water from a former utility trench located inside Building 353 and surface runoff from the open area outside the building. According to the drawing, they discharged to a 4-inch diameter clay tile leach line that appeared to run north from the westernmost dry well under the west edge of the clarifier. The length and depth of the leach line are unknown. In approximately 1983, the utility trench was abandoned, and one of the dry wells collapsed, producing a visible surface depression in the overlying asphalt pavement. A bench-scale paint stripping operation was reportedly set up over the collapsed dry well at that time, and it continued operation until approximately 1986. The stripping operation likely used chemicals such as methylene chloride, MEK, or TCA to remove paint or oils from small metal parts. In 1986, the old asphalt was removed, the dry wells were filled, and the area was repaved. A strip rinse tank, which reportedly was rarely used, is located against the west outside wall of Building 353B over the location of one of the dry wells. The tank, designated B-6-D in the plant-wide survey (Lockheed, 1983), is a 700-gallon, aboveground, stainless steel tank installed in 1980 to hold methylene chloride for paint stripping. A work table southwest of the tank was reportedly used as a staging area for paint strip operations at the strip rinse tank.

4.19.3 Previous Investigations

Gregg and Associates reported that a 1,000-gallon steel spill containment sump, designated B-6-C, was installed in 1981 and was associated with aboveground process tanks in Building 353. The documentation states that the sump collects spillage from wash tanks. However, it does not clearly describe if the sump or tank is associated with the aluminum cleaning line, the titanium cleaning line, or the titanium pickle overflow tank or indicate the location of B-6-C. Based on the review of facility drawings, interviews with Lockheed personnel, and site inspection, it appears that the Gregg referenced facility B-6-C is actually the easternmost concrete spill containment pit, described above. Gregg and Associates were scheduled to inspect the facility in 1984, but this was postponed because it would have "significantly impacted normal process operations." The sump was rescheduled to be inspected in 1985 but Gregg and Associates reported that Lockheed employees indicated that the sump was

normally dry, and the sump was declared exempt from the leak detection program. ENSR reported in May 1990 that sump B-6-C was exempt from underground storage compliance because the container is used for a flow-through process; the sump was listed as empty.

The six-stage clarifier designated B-6-F is located at the western exterior of Building 353. The 3,000-gallon clarifier receives final rinse water from metal processing that occurs in the building. Rinse water from clarifier B-6-F was sampled in October 1983 and was found to contain 3.05 mg/L total chromium, 2.94 mg/L hexavalent chromium, 2.6 mg/L fluoride, 9.5 mg/L phosphate, 0.97 mg/L titanium and 15 mg/L oil and grease, with a pH of 7.1 and 780 mg/L TDS. The clarifier was visually inspected by Gregg and Associates in December 1984. The coated concrete interior of the clarifier apparently showed no signs of degradation, although an approximately one-eighth inch thick chemical precipitate was noted on the walls and five to ten inches of silty sediment were observed on the floor of the clarifier stages. Gregg and Associates drilled a 17-foot deep soil boring east of the clarifier; the boring was completed as a suction lysimeter. Soil samples were collected at the 10- and 17-foot depth intervals. The two soil samples were composited, and 448 ppm sodium, 1,470 ppm sulfate, and 0.5 ppm phosphate were detected. The soil had a pH of 5.98. Gregg concluded that the clarifier was unlikely to be leaking. ENSR listed the contents of the clarifier as hexavalent chromium in May 1990 and declared the clarifier to be exempt from underground storage compliance because the clarifier is used for a flow-through process.

4.19.4 Site Inspection

Site inspections of Building 353 were conducted in January and February of 1991. The process line tanks and degreaser in the north portion of Buildings 353 and 353B appear to be in good condition. The concrete beneath the titanium pickle overflow tank, which is at grade, is etched. No cracks or significant stains were noted in the concrete containment pits beneath the process line tanks. The concrete floor of the building appeared to be in good condition. Approximately ¼-inch of oil was noted in the machine pits beneath the 300-ton hot press and the Sheridan Gray presses. A utility pit containing a 1-inch water line and an unidentified 4-inch line was noted west of the 300-ton hot press. The pit had no significant staining. No stains were noted in the vicinity of the furnace, quench pit and refrigerator in the southwest corner of the facility. Nineteen 55-gallon drums of TCA were noted outside the southeast corner of Building 353A, where they were reportedly kept temporarily during servicing of the TCA vapor degreaser.

A pump for the sodium metabisulfite tank west of Building 353 is caked with precipitate and appeared to be corroded. The chemical supply tanks, sludge tank and filter press appear to be in good condition. No significant stains were noted near the boiler, the six-stage clarifier, the dry wells, and the strip rinse tank. The strip rinse tank is currently empty. A compressor for the refrigerator inside Building 353B

is located at the outside southwest corner of the building. The fill ports for the clarifier chemical supply tanks are located west of the compressor. No significant stains were noted near the refrigerator compressor or the chemical supply fill ports. Three small, dry-type transformers are located on the wall of Building 353B near the north end of the clarifier, and no stains were visible near the transformers. Minor amounts of sediment, but no significant stains, were noted in the walkway north of the building.

4.20 PARCEL 2 YARD AREA

In the past, significant portions of the Lockheed Plant B-6 Parcel 2 area consisted of open yards areas. The Parcel 2 yard area has included most of the area south of Buildings 332 and 333 to Building 322, as shown on Figure 4-26. The yard area began to be developed in the early 1940s as aircraft production increased at Plant B-6. The Parcel 2 yard area has been used for the following: flight line operations, including aircraft final assembly, minor aircraft maintenance, and aircraft parking with associated blast fences; flight line and final assembly support buildings; and Lockheed employee parking. Flight line operations were typically conducted adjacent to the blast fences. More recently, the yard area has been used for Lockheed employee and Burbank-Glendale-Pasadena Airport parking.

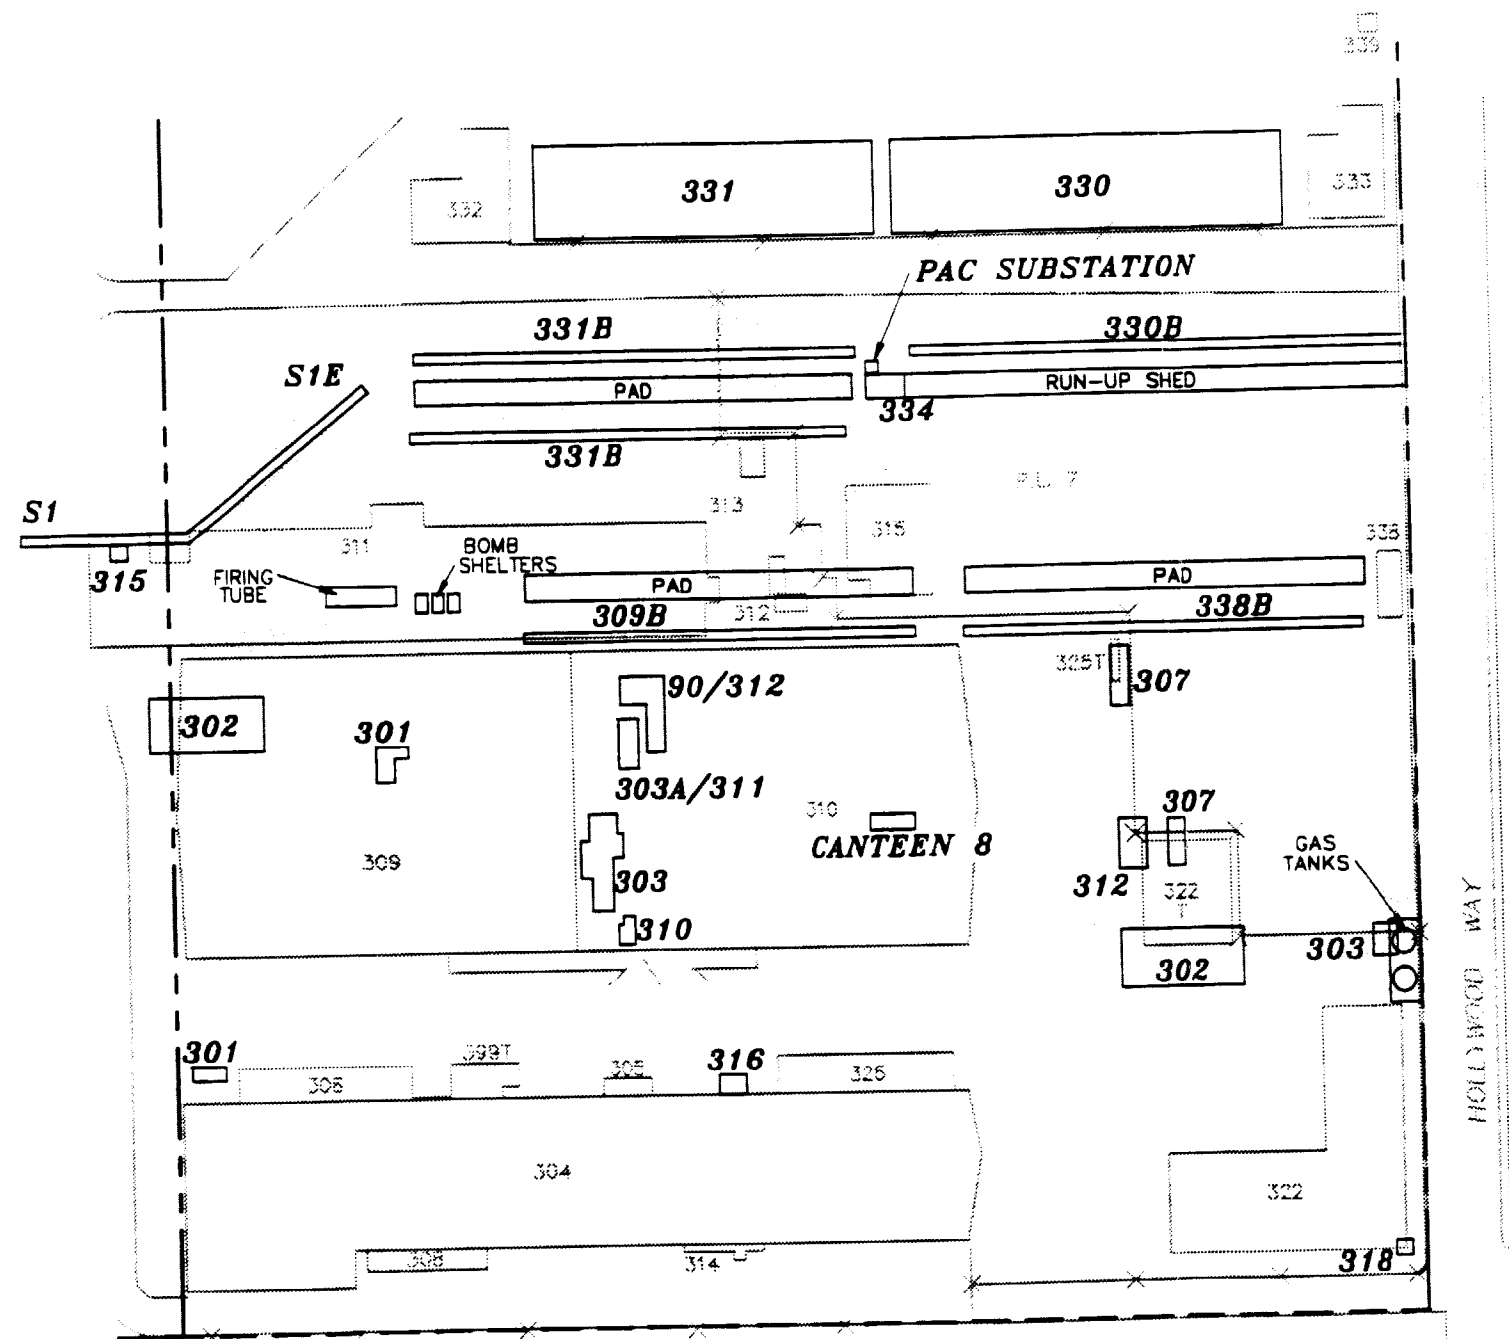

Facility drawings and aerial photographs indicate that the yard area has been paved with asphalt since the mid-1940s. The paved ground surface in the yard area is relatively flat, with a gentle slope to the southeast. Surface runoff from the yard drains to the east to storm drain trenches located at the north ends of Buildings 311 and 310 and to drains located north of Building 338 and in Parking Lot 7.

A discussion of the facilities located in the Parcel 2 yard area is presented below.

4.20.1 Flight Line Operations and Blast Fences

Beginning in the mid-1940s, the northern half of the Parcel 2 yard area was used for aircraft flight line operations. Two flight line areas existed in the yard area: one south of Buildings 332 and 333, and one on the northeast corner of Building 309 that extended to Building 338. The flight line south of Buildings 332 and 333 included the following facilities: an eastern section of the S1 blast fence, described in the Plant B-6 Parcel 1 EA report, denoted S1E; two blast fences south of former Buildings 330 and 331, shown on Figure 4-26 as 331B and 330B; one run-up shed located south of former Building 330; and the 330 blast fence shown on Figure 4-26 as 330B. The flight line extending from the northeast corner of Building 309 to Building 338 included two blast fences labeled 309B and 338B on Figure 4-26. The blast fences and run-up shed were demolished over an 18-year period; the 331B and 330B blast fences were demolished by 1964, the run-up shed was demolished by 1948, the 338B blast fence was demolished in 1946, and the 309B blast fence was demolished by 1956. In addition, blast fence 331B was moved in the mid-1940s. Initially it was about 120 feet south of Building 331, but it was moved about 80 feet further south. Both locations are shown on Figure 4-26. These former flight line areas have been converted to Lockheed employee and Burbank-Glendale-Pasadena Airport parking lots.

FIGURE 4-26
 PARCEL 2
 YARD AREA

LEGEND

- PARCEL 2 BOUNDARY
- ==== FORMER BLAST FENCE
- 315 PRESENT BUILDING
- 302 FORMER BUILDING
- STAINING

Blast fences were constructed to deflect the blast of air generated by aircraft propellers and jet engines. The blast fences were of wood A-frame construction, with approximately a 10-foot wide base. The run-up shed was of wood frame construction with a wood roof and open sides. Concrete pads were located adjacent to the blast fences and underneath the run-up shed to support the weight of parked aircraft. Nearby buildings supplied compressed air and electricity to the flight lines via trenches, subsurface piping and piping on the blast fences, and utility pits.

During the mid-1940s to the late 1940s, the Parcel 2 yard area was used for flight line operations for the P-38 fighter, Hudson bomber, and P-80 fighter. Flight line operations were generally conducted on the north side of the blast fences with the exception of the blast fences S1E and 330B. These flight line operations included final assembly of the Hudson bomber, engine testing, P-38 aircraft tail modifications, minor maintenance, and aircraft inspection prior to client delivery. The run-up shed was used for testing and running the aircraft engines. During this period, flight line ladders, scaffolding, and other equipment were stored along the southeast side of the S1E blast fence. As stated above, aerial photographs from 1945 indicate the 331B blast fence was moved to the south in line with the run-up shed. Trenches and utility pits were present in the concrete slab adjacent to the 331B blast fence.

By 1946, the 338B blast fence was torn down and the area was a parking lot. The parking lot extended north to the run-up shed. The remaining section of the flight line (northeast of Building 309) was used for storing Constellation aircraft skins prior to final assembly in Building 309. By 1948, the run-up shed was torn down. Aerial photographs from 1945, 1946, and 1948 indicated the presence of minor, localized dark staining on the concrete pads adjacent to all the blast fences.

According to interviewed Lockheed employees, a flight school or club was located in the flight line area from the late 1940s to 1950. Assorted small civilian and military aircraft are parked along the blast fences on photographs from 1948 and 1950. By 1951, P-51 Mustang aircraft were being modified by Pacific Airmotive Corporation along the 331B and 330B blast fences. The 309B blast fence was used for assorted flight line equipment storage. By 1953, a used aircraft dealer was renting the area in the vicinity of the S1E blast fence and a single aircraft run-up shed was built into the 331B blast fence. From 1954 to 1964, assorted small and large aircraft were parked adjacent to the blast fences, and it appears that minor maintenance operations were performed on the aircraft. Aerial photographs taken in 1951 to 1964 show evidence of minor to moderate staining on the concrete pads adjacent to the 331B and 330B blast fences and on the south side of the S1E blast fence. By 1964, the blast fences in the yard area had been demolished. From 1964 to present, the former flight line areas have been occupied by Buildings 311, 312, 313, 315, and Parking Lot 7.

During the site inspection of the yard area, physical evidence was observed of the former 309B blast fence, concrete slabs adjacent to the blast fences, and concrete slabs beneath the former run-up shed. Blast fence footings are visible on the north side of Building 310, adjacent to a storm drain trench. The storm drain trench appears to have been located beneath the blast fences 309B and 310B. The storm drain trench is lined with asphalt and was in fair condition. The concrete pads adjacent to the former blast fences and underneath the former run-up shed are visible as linear cracks in the asphalt. The utility pits visible in aerial photographs adjacent to the 331B blast fence are present south of Building 332 and are covered with steel plates. The steel plates could not be opened to inspect the utility trenches. The flight line area is currently utilized as a Lockheed employee and Burbank-Glendale-Pasadena Airport parking lots. The asphalt surface of the parking lots in the vicinity of the former flight line area is in good condition with localized minor staining from parked automobiles.

4.20.2 Yard Area Support Buildings

Small portable and non-portable buildings, and other facilities were associated with the flight line and final assembly operations in the Parcel 2 yard area. The buildings had wood-frame construction with wood, canvas, or asphalt-coated roofs and were typically used as tool cribs, parts and equipment storage areas, inspection offices, and maintenance facilities. The former buildings included Buildings 90, 301, 302, 303, 303A, 307, 310, 311, 312, 316, 318, 334, and canteen no. 8. The other facilities present in the yard area included a firing tube or range and bomb shelters along the north wall of Building 309. The buildings, firing tube, and bomb shelters, which were identified on facility drawings, are discussed below.

Facility drawings dated 1945 and 1947 show a building located approximately 50 feet east of Building 309. The structure is designated Building 90 on the 1945 drawing and Building 312 on the 1947 drawing. By 1953, the structure had been removed and Building 312 was relocated approximately 200 feet east of Building 310. Building 90/312 contained offices.

Building 301 is shown on a 1944 facility drawing approximately in the center of the future site of Building 309. By 1945, Building 301 was moved to the north side of Building 304. The function of Building 301 is unknown, but the building may have been used to support flight line operations.

In 1944, Building 302 was located at the northwest corner of the future site of Building 309. The building was moved approximately 155 feet east of Building 310 in the southern portion of Parcel 2 yard area, and was at that location from 1945 to 1965. Fire insurance maps from the late 1940s show a machine area, carpenter shop, a paint booth, lumber storage, and offices within Building 302. According to Lockheed personnel, Building 302 was used as a maintenance facility before Building 370 was built in 1965. Reportedly, typical equipment serviced in

Building 302 would include ladders, hydro-gigs, and equipment used to support flight line operations. Chemical usage at Building 302 included solvents, hydraulic oil, and paint. According to Lockheed personnel, no spills were known to have occurred at Building 302.

East of Building 302, the fire insurance maps show a small building that contained a welding shop and metal storage area, and two vertical aboveground fuel tanks. Aerial photographs from the 1940s and 1950s indicate the presence of the fuel tanks adjacent to Hollywood Way from 1945 to 1951. The fuel tanks were enclosed within a concrete containment structure. A dirt roadway encircled the tanks and may have been used by vehicles dispensing fuel from the tanks. Aerial photographs from 1945 show evidence of dark staining on the roadway around the tanks. The former location of Building 302, the welding shop, and the above-ground fuel tanks is currently occupied by Building 322T and a parking lot.

Building 303 is shown on a 1942 facility drawing approximately 20-feet east of the future site of Building 309. Aerial photographs from 1945 indicate that Building 303 had been removed. Building 303 was used as a pilot's house. In the late-1950s, a second Building 303 was located east of Building 302, adjacent to Hollywood Way. The function of the second Building 303 is unknown, but it may have supported maintenance operations in Building 302.

Buildings 303A and 311 are shown on 1945 and 1947 facility drawings and appear to be the same building located approximately 40 feet east of Building 309. Aerial photographs from 1953 indicate that the building had been removed. The building was used for template storage and jig making for final assembly operations.

Building 307 is shown on facility drawings in the 1950s and 1960s in two locations approximately 150-feet and 200-feet east of Building 310. The function of Building 307 is unknown, but the building may have been used to support aircraft flight line or final assembly operations.

Building 310 is shown on 1948 facility drawings located approximately 50-feet east of the southeast corner of Building 309. Aerial photographs from 1953 indicate that Building 310 had been removed. Building 310 was used as a shipping office and garage. The chemical use practices at the building are not known.

Building 316 was located on the north side of Building 304. The building was used as an office for the Factory Transportation Department for a period up until approximately 1967. In 1967, the building was removed.

Building 318 was located at the southeast corner of Parcel 2 at the present location of Building 322. In the 1950s, Building 318 functioned as an electrical switchgear station. The building contained battery racks and electrical switchgear equipment. It is not known whether Building 318 contained PCB-containing equipment. Subsurface electrical lines from Buildings 310 and 340 were routed through Building 318. By the early 1960s, Building 318 was no longer present.

Building 334 was located on the west side of the run-up shed south of Buildings 330 and 331 from 1945 to 1964. Building 334 contained offices for flight line support operations. Staining from aircraft being maintained adjacent to Building 334 was visible on aerial photographs dated 1948 and 1954.

Canteen no. 8 was located approximately 350-feet east of Building 309 from 1945 to 1953. The canteen served as an eating establishment for Lockheed employees.

A firing tube was located outside the north wall of Building 309 from 1945 to 1952. The firing tube was cylindrical in shape and was constructed of concrete with an earthen roof. The function of the firing tube is unknown, but it may have been used for the storage and/or test firing and alignment of armaments.

East of the firing tube along the north wall of Building 309 were three aboveground, concrete bomb shelters. These bomb shelters were present from 1945 to 1961.

4.20.3 Parking Lot 7

Parking Lot 7 currently includes the area south of Building 333, east of Building 311, and north of Building 322. Parking Lot 7 was constructed in the late 1940s as portions of the Parcel 2 flight line were removed and was expanded to the current configuration in 1964. The parking lot provides parking for Lockheed employees and Burbank-Glendale-Pasadena Airport customers.

A 750-kVA transformer was located on the parking lot approximately 110-feet south of former Buildings 330 and 331 from 1965 to 1988. The transformer was identified as the Pacific Airmotive Corporation substation. The transformer contained 370-gallons of fluid with a PCB concentration of 324 ppm. In 1988, the transformer, the concrete slab beneath it, surrounding asphalt pavement, and other debris were removed and disposed. A Lockheed transformer survey report indicated the concrete slab beneath the transformer had evidence of old PCB leaks. In 1984, an automatic teller machine was installed adjacent to the north side of the former transformer.

Upon inspection of Parking Lot 7, the asphalt was in fairly good condition with localized minor staining from parked automobiles. Linear cracks were visible in the asphalt in locations correlating to the former concrete pads that were adjacent to the former blast fences. At the northeast corner of the parking lot next to Hollywood

Way was a below-grade, cement-lined storm sewer. The concrete storm sewer was in good condition with no evidence of staining. The former transformer location consists of an asphalt patch approximately 20 feet square located on the south side of the automatic teller machine. The patch is in good condition with no evidence of staining.

4.21 PARKING LOT 8

Parking Lot 8 is located in the northeastern portion of Parcel 2, Plant B-6, as shown on Figure 4-1. The parking lot is bordered by the fence east of Building 82, Pacific Airmotive Corporation (PAC), and Image Transform Company on the west; a storm water flume on the south; Hollywood Way on the east; and San Fernando Road on the north. The parking lot is used for Lockheed Advanced Development Company (LADC) employee automobile parking. Figure 4-27 shows Parking Lot 8 and surrounding features.

Information on the historical and recent uses of the Parking Lot 8 area was obtained through interviews with Lockheed personnel Mr. Joe Giannone and Mr. Harley Wagoner and historical aerial photographs of the area. The following discussion is divided into previous operations and present use, and site inspection.

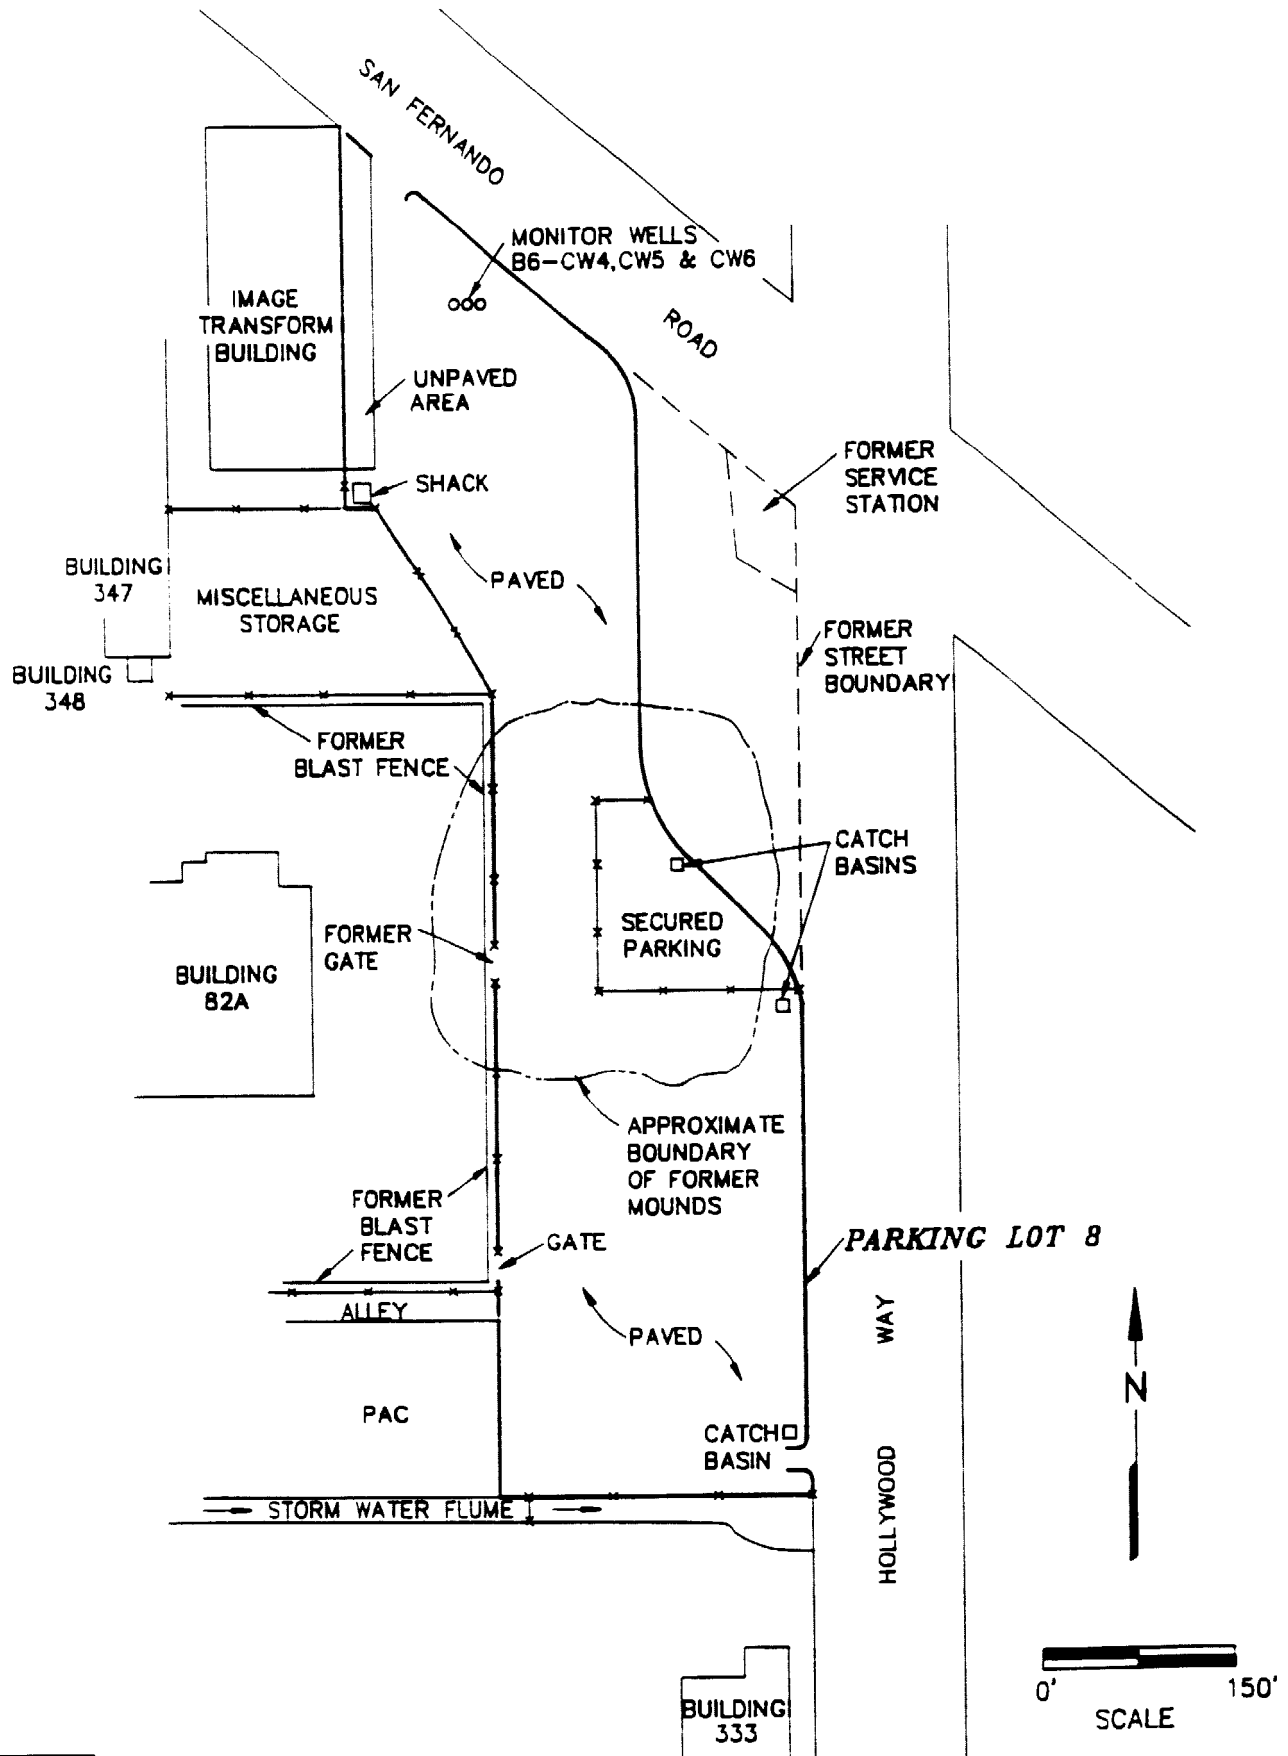

4.21.1 Previous Operations and Present Use

In general, Parking Lot 8 has been used as a parking lot since it was acquired by Lockheed in approximately 1941. Aerial photographs dated 1945 show automobiles parked within the paved southern quarter of the area and extending west within a paved area at the current location of PAC. The remainder of the area was unpaved at the time of this photograph. Mounded material, possibly fill material from the construction of Building 82A in 1945, is visible within the central 1.5 acre portion of the parking lot area. Some discoloration was noted in this mounded material in the aerial photographs. It is unclear whether materials other than fill were dumped in this area.

By 1948, the mounds had been leveled or removed, and parked automobiles were noted within the unpaved portions of the Parking Lot 8 area. A service station, located on the corner of San Fernando Road and Hollywood Way, and PAC had been constructed by the time of this photograph. By 1956, 80 percent of the parking lot area had been paved. The paved area extended north to the service station location.

In 1962, the northern portion of the paved area was extended west approximately 150 feet to Building 347. Aerial photographs dated 1965 show evidence of a two-story structure within an unpaved area near the northern end of the western border of Parking Lot 8. The service station had been demolished by 1968. The area northwest of the parking lot area, in the current location of Image Transform Company, had been paved by 1968. The Building 82 blast fence, which was located

FIGURE 4-27
PARKING LOT 8
PLOT PLAN

west of the Parking Lot 8 area, was demolished in approximately 1975. The two-story structure near the northwest corner had been demolished and that area had been paved by 1977. The Image Transform Company building is visible west of the northwest portion of the subject area in 1977 aerial photographs. At this time, the only remaining unpaved area was located within the extreme northeast corner of the parking lot.

Aerial photographs dated 1986 show the existing Parking Lot 8 area to be entirely paved with the exception of a narrow strip along the western side of the northern end of the parking lot area. The grounds of the former service station had been excavated for the installation of the Hollywood Way underpass at that intersection.

Three groundwater monitoring wells (B6-CW4, B6-CW5, and B6-CW6) are located within the northern portion of the parking lot. These wells were constructed as part of the regional groundwater characterization investigation, discussed in further detail in the Groundwater Investigations section of this report (Section 3.5.1).

4.21.2 Site Inspection

The asphalt in Parking Lot 8 is generally in good condition with isolated areas of minor cracks and discontinuities. Localized areas of oily stains were noted throughout the parking area due to leaks from automobiles parked in the area.

Surface drainage in the parking lot flows to the south-southeast. The storm water flume along the southern perimeter of the parking lot intercepts surface runoff from Parking Lot 8. The flume discharges to the City storm water drainage system located beneath Hollywood Way. Three catch basins which also discharge to the City storm drainage system are located on the eastern perimeter of the parking lot. The catch basins are clean and free from any obstructions. No indication of stains were noted in the catch basins. No stains were noted in the concrete-lined storm water flume immediately south of the parking lot. A minor amount of debris was, however, noted against a wood grate at the point of discharge from the flume to the City storm drainage system.

An unpaved strip of ground is located in the parking lot area adjacent to the Image Transform building. This strip is approximately 25-feet wide and 200-feet long. Items noted in this area include paper, glass, tin cans, and general debris. No stains were noted on the soil surface.

A skid-mounted 6-foot wide by 7-foot long by 8-foot tall wooden shack was noted near the northwest corner of the parking lot. The shack appeared to have been abandoned for many years.

The fenced area west of the parking lot and east of Building 347 is used by Lockheed for storage of miscellaneous items. Items noted in this paved area include racks, construction materials, demolition materials, templates, carts, desks, drawers, file cabinets, and various metal plates, rods, and other pieces. No stains are visible beneath these items.

An approximately 0.3-acre fenced area is located within the central portion of the parking lot. Boats, recreational vehicles, and automobiles were noted within the secured parking area.

Twelve-inch square concrete footings for the former blast fence are visible along the Building 82 fence line that borders the western portion of the parking lot. No evidence of staining in the vicinity of the former blast fence was noted.

4.22 FACILITIES ADJACENT TO PARCEL 2

Facilities adjacent to Parcel 2 were evaluated to identify potential contamination sources that may impact soil on Parcel 2.

Facilities located adjacent to Parcel 2 can be categorized in one of three areas: Plant B-6, Parcel 1 facilities, which lie immediately west of Parcel 2; former Lockheed facilities now owned by the Burbank-Glendale-Pasadena Airport, which lie immediately south of Plant B-6; and non-Lockheed facilities that lie north and east of Parcel 2. Plant B-6, Parcel 1 facilities were addressed in the "Environmental Assessment Report for the Lockheed Plant B-6 Facility, Parcel 1, Burbank, California" (McLaren/Hart, 1991). Non-Lockheed facilities north and east of Parcel 2 are addressed in the Regulatory Agency File Review, Section 5 of this report. The former Lockheed facilities immediately south of Plant B-6 that are now owned by the Burbank-Glendale-Pasadena Airport are discussed below.

The facilities that were evaluated included the flight line area south of Building 304 and former LAT Hangars 3, 4, 6, 7, and 8. The locations of these facilities are shown on Figure 4-28. LAT owned the area from approximately 1941 to the mid-1980s.

4.22.1 Building 304 Flight Line

The Building 304 flight line was located approximately 100 to 330 feet south of Building 304 from 1946 to 1985. A Burbank-Glendale-Pasadena Airport parking lot currently occupies the former flight line site. The flight line and adjacent blast fence were used for aircraft preflight and production testing operations on aircraft produced at the Plant B-6 facility. The flight line consisted of six aircraft stalls (tie-down pads) and a blast fence located to the south of the pads from 1946 to 1953. In 1953-1954 the blast fence was lengthened to the east to add two aircraft tie-down pads for testing.

Preflight and production testing operations conducted on the flight line included fuel and oil soak, and engine testing. The fuel and oil soak testing consisted of checking fully fueled and oiled aircraft for fuel and engine system leaks. Fuel and oil were supplied by tanker truck from Hangar 7. When leaks occurred, half-barrels were used to catch the leaking fluids. Spills occasionally occurred throughout the period the flight line was operational. If fuel or oil spilled onto the ground, the fluid was either absorbed with sand or hosed off with water. The wastewater runoff flowed to the southeast, following the natural slope of the ground surface. A concrete-lined sump, B-6-T, was located at the eastern edge of the blast fence and collected at least

FIGURE 4-28
 FORMER LOCKHEED FACILITIES
 SOUTH OF PARCEL 2

LEGEND

- PARCEL 2 BOUNDARY
- [L.A.T. 7] FORMER BUILDINGS
- [BLDC 308] CURRENT BUILDINGS
- STAINING

part of the fuel and oil washwater from flight line operations. The sump was reportedly removed in 1984. Information was not available on the location of sump B-6-T, the methods used to remove the waste water from the sump, the frequency the sump was cleaned out, and/or the method of disposal for the waste water, nor was information available on the condition of the soil beneath the sump when it was removed. Aerial photographs from 1946 to 1985 indicate the presence of dark discoloration or staining adjacent to the blast fence.

Building 324 was a former drum storage structure located within the Building 304 blast fence from approximately 1964 to 1984. Stored drums contained hydraulic oil, Stoddard solvent, TCA, IPA, and MEK. The chemicals were used for aircraft parts cleaning and aircraft servicing operations adjacent to the blast fence.

Electrical Substation T was located adjacent to Building 324 from 1970 to 1984. The substation provided electricity for flight line operations. Facility drawings indicated the substation had an oil-filled 1,000-kVA transformer that contained 53 ppm PCBs. The transformer was removed and properly disposed of in 1984.

Building 313/113 was located at the easternmost portion of the Building 304 blast fence from 1953 to 1964-1968. Factory Mutual maps and facility drawings label the building both 113 and 313. Interviewed Lockheed personnel indicated the building contained offices and stored equipment used for fuel soak testing. Additional information on this building was not available.

Currently, the Building 304 flight line area is a Burbank-Glendale-Pasadena Airport parking lot. During inspection of the parking lot, concrete tie-down pads were observed. The tie-down pads were on the north side of the former blast fence. Former utility trenches located adjacent to the former blast fence were visible as asphalt patches. Raised asphalt and steel anchor bolts were present in the former location of the blast fence. Evidence of Building 324, Substation T, and Building 313, were not visible. The asphalt is heavily cracked and deteriorated in the vicinity of the easternmost tie-down pad. No staining was observed along the former flight line area.

4.22.2 Flight Line Hangars

South of Buildings 304 and 322, adjacent to the Parcel 2 environmental assessment boundary, were five hangars associated with airport operations: Hangars 3, 4, 6, 7, and 8. Hangars 3, 4, 7, and 8 were constructed from 1930 to 1941, and all but Hangar 4 were dismantled between 1977 and 1983. Aerial photographs from 1939, 1941, and 1942 indicate Hangar 6 was constructed between 1939-1941 and dismantled in 1942. Hangar 4 is still present and is discussed below. Operations conducted in the hangars included aircraft modification and maintenance, aircraft fuel truck and oil truck maintenance, oil and fuel supply, woodworking, and metal machining. Two aboveground vertical tanks outside the east wall of Hangar 6 are visible in an aerial

photograph from 1941. Factory Mutual Fire Insurance maps for 1965 indicate the presence of seven gasoline and lube oil underground storage tanks outside the south wall of Hangar 7. Aerial photographs from 1939 to the 1970s indicate moderate to heavy staining was present on the asphalt surrounding Hangars 3, 4, 7, and 8.

There was no evidence of former Hangars 6, 7, and 8 noted during the site inspection. These former hangar areas have been asphalt paved. A concrete pad covers a portion of former Hangar 3. The concrete pad was cracked and was oil stained.

Hangar 4 is located at the southwest corner of Winona Avenue and Hollywood Way, approximately 70-feet south of Building 322. Factory Mutual Fire Insurance maps list a 1930 construction date for Hangar 4. The hangar had been used for aircraft and helicopter maintenance. Hangar 4 is currently owned by the Burbank-Glendale-Pasadena Airport and leased by Aircraft Service International. Aircraft Service International maintains aircraft fueling trucks at the hangar. Aerial photographs from 1939 to the 1970s indicate the presence of moderate to heavy staining west and south of the hangar.

During the site inspection, staining was noted at two locations within Hangar 4: a mineral spirits degreaser and puddled hydraulic fluid beneath a forklift. The mineral spirits degreaser was observed in the southwest corner of Hangar 4 and the floor beneath the degreaser had settled and cracked. The forklift and oil stain were noted adjacent to the north wall of Hangar 4.

Oil and grease are stored in 55-gallon drums along the south wall of Hangar 4. Outside the west and south walls of the hangar, drum storage areas, an air compressor, and a cart that was filled with oil-stained dry sweep material were noted. The air compressor had leaked oil onto the ground and stained the asphalt in a small area around it. The asphalt is stained beneath the dry sweep cart. West of the hangar, the asphalt and concrete surface is cracked and has moderate to heavy oil staining.

SECTION 5

REGULATORY AGENCY FILE REVIEW

A review of regulatory agency files was conducted as part of the Plant B-6 environmental assessment to provide a basis for identifying areas of environmental concern within and adjacent to the Parcel 2 area. A neighborhood field survey of properties within approximately 500-feet of Parcel 2 was performed to identify operating companies in the area and assist in the agency file review. The following agencies were contacted during the period of May through July 1991 for information pertaining to Plant B-6 and adjacent properties:

- California Regional Water Quality Control Board - Los Angeles Region (RWQCB);
- U.S. Environmental Protection Agency, Region IX (EPA);
- California Department of Health Services (DHS);
- South Coast Air Quality Management District (SCAQMD);
- City of Burbank Department of Public Works;
- City of Burbank Fire Department;
- City of Los Angeles Fire Department.

The type of information obtained from these agencies included discharge permits, underground storage tank permits, on-site inspection reports, notices of violation, sampling results to confirm permit compliance, and general correspondence. A significant portion of the records on file at the agencies was generated by Lockheed as part of regulatory compliance or in response to directives from specific agencies. Several reports documenting site investigations at Lockheed facilities, which have been summarized in the section on Previous and Ongoing Site Investigations, were also included in the agency files.

The purpose of the regulatory review was to identify specific Lockheed installations and operations that may suggest a potential source of contamination to soil beneath Parcel 2. The review focuses on Plant B-6 facilities, as well as off-site facilities close to the Parcel 2 portion of Plant B-6 that are known or suspected to have contamination which could adversely affect soil at Plant B-6. Relevant information obtained is discussed below by agency. A certain amount of duplication of records on file was noted between the different agencies. The information is presented according to the agency that generated the documents.

5.1 CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD - LOS ANGELES REGION (RWQCB)

The RWQCB has files for Lockheed Plant B-6 that include report transmittals, RWQCB comments on proposals and reports, and correspondence. The majority of this information was related to the site-wide groundwater investigation discussed in Section 3 of this report. None of the information addressed potential soil contamination within Parcel 2.

Review of the Leaking Underground Storage Tank (LUST) List compiled by the RWQCB and review of the agency files indicated that Plant B-6 and the following nearby facilities are subjects of current or past RWQCB investigations:

Aircraft Service International

Burbank

Meissner Manufacturing Co.
3750 Cohasset Street
Burbank

Pacific Airmotive Corporation
2940 Hollywood Way
Burbank

Aviall, Inc. is located adjacent to the northwest portion of Parcel 2 near Building 352. Pacific Airmotive Corporation operates a jet engine test cell facility within the Parcel 2 area, east of Building 83. The other properties are located within 500 feet of Parcel 2. Based on their proximity to Plant B-6 Parcel 2, chemicals released to soil at these facilities are considered to have the potential to migrate into soils beneath Parcel 2. A brief summary of investigations conducted at these facilities is presented below.

5.1.1 Aircraft Service International

Aircraft Service International, located approximately 70-feet south of Parcel 2 Building 322, maintains and operates aircraft fueling trucks. Chemicals used include aircraft fuels, solvents, oil, and grease. The maintenance shop at this facility contains a 300-gallon skid-mounted aboveground tank for waste oil. Soil samples collected from two soil borings drilled in a parking lot adjacent to the west side of the facility in 1987 were analyzed for TPH. No detectable concentrations of TPH were observed in the soil samples.

5.1.2 Aviall, Inc.

Aviall, Inc. overhauls and repairs jet engines and has occupied its present site since approximately 1952. Chemicals used at the Aviall facility include chlorinated solvents such as PCE, TCE, TCA, and methylene chloride, petroleum hydrocarbons such as lubricating oils and jet fuel, Stoddard solvent, phenols, alcohols, ketones, acids, bases, plating solutions containing heavy metals and cyanide, and nitrogen compounds such as ammonium hydroxide, ammonium chloride, and sodium nitrite. A total of 10 underground tanks which contained fuel, waste oil, solvent and rinsate, two aboveground PCE dispensers, and one aboveground TCE dispenser have been used since Aviall began operations at the site. Two additional underground tanks (Tanks 1 and 2 containing waste oil and gasoline, respectively) were located on property north of Cohasset Street that formerly belonged to Aircraft Tank Service, Inc. This property was purchased by Aviall. However, Aviall never operated the two tanks. Other chemical use areas at the Aviall site include degreasers, metal plating process lines, parts cleaning dip tanks, an engine test area, a steam cleaning area, machine shops, chemical and hazardous waste storage areas, a maintenance yard, and a paint shop. Investigation of the areas that potentially released chemicals to soil is proceeding under the Well Investigation Program of the RWQCB. On-site investigations conducted to date have determined that soils beneath the plating shop have been affected by chemical releases. Concentrations of cyanide up to 7.15 mg/kg, total nickel up to 267 mg/kg, soluble nickel up to 27.4 mg/kg, zinc up to 48.2 mg/kg, and pH as low as 4.2 have been detected in soils two to five feet

below ground surface at the plating shop. Aviall submitted a work plan for site-wide subsurface soil investigations on August 8, 1990. In a letter dated November 5, 1990, the RWQCB requested additional soil borings at locations identified by Aviall and also requested investigations at other identified chemical use areas. In addition, a re-inspection of the facility by RWQCB staff to evaluate the need for soil borings at other chemical use and storage areas was conducted. Aviall submitted an amended work plan for the site-wide soil investigation on January 15, 1991 and a proposed work schedule on March 28, 1991.

Seven of the twelve underground tanks owned by Aviall (Tanks 1 through 5, 11, and 12) were removed in 1989 and 1990. Two of the five remaining tanks (Tanks 6 and 7) were closed in place by December 1990. An additional underground storage tank, which has been designated Tank 7A, was encountered immediately north of Tank 7. This tank, which held Stoddard solvent and had a capacity of 2,000 gallons, was removed in December 1990. The three remaining active tanks (Tanks 8, 9, and 10) are 10,000-gallon Jet A fuel tanks located in a fuel tank farm on the west property line, adjacent to Lockheed Parcel 1 and east of Building 342. Aviall stated its intent to remove the three tanks in a letter to the Burbank Fire Department dated October 19, 1990. In a letter dated November 19, 1990, the City of Burbank requested that Aviall "provide a written, legally binding, commitment" that the tanks would either be closed or brought into compliance with underground tank regulations. Tanks 8, 9, and 10 were scheduled for removal and replacement in June 1991.

Soil investigations have been performed at 8 of the 12 Aviall tank sites. Tanks 7, 9, 11, and 12 have not yet been investigated. Results of the tank site investigations showed no detectable concentrations of petroleum hydrocarbons at tanks 2, 3, 4, 5, 8, and 10. TPH were detected at a concentration of 44 mg/kg at a depth of 12 feet near Tank 1. TPH at concentrations ranging from 21 to 2400 mg/kg were detected in soils near Tank 6 (north of Lockheed Building 51) at depths up to 50 feet (the total depth of soil borings). The highest concentrations of TPH at Tank 6 were detected at a depth of 10 feet. Concentrations of ethylbenzene, toluene, xylenes, and/or PCE from 5 to 80 $\mu\text{g}/\text{kg}$ were also detected in the four soil samples with the highest petroleum hydrocarbon concentrations at this tank site. In the November 1990 RWQCB letter discussed above, additional soil borings were required at Tank 6 and seven other tank locations, including the three active jet fuel tanks.

5.1.3 Camelot Press

Camelot Press is a commercial printer located approximately 500 feet east of Parcel 2 Building 322. Alcohol-based chemicals are primarily used in the printing operations. In a letter dated March 8, 1988, the RWQCB informed Camelot Press that its handling of chemicals and wastes was satisfactory and no further action was required.

5.1.4 G.W. Bandy, Inc.

G.W. Bandy, Inc. operates a machine shop and stores parts and raw material inventory at the 3086 Avon Street location. The facility was inspected by RWQCB staff on February 18, 1988 and found to have a barrel storage area. In a letter dated March 2, 1988, the RWQCB requested a work plan for a soil investigation at the barrel storage area. In a letter dated July 18, 1988, the RWQCB informed G. W. Bandy, Inc. that the chemicals detected beneath the barrel storage area, acetone, Freon 113, and TPH, were below State Action levels for drinking water and that no further investigation was necessary.

5.1.5 Hydra-Electric Company

Hydra-Electric Company manufactures switches and has occupied its current site at the corner of Cohasset and Kenwood Streets, approximately 300 feet north of Parcel 2 Building 88, since 1955. Chemicals used at the Hydra-Electric facility include chlorinated solvents such as TCA, methylene chloride and 1,1,2-trichloro-1,2,2-trifluoroethane (CFC-113), hydrocarbon solvents, petroleum hydrocarbons such as cutting oils, alcohols, ketones, acids, bases, brush plating solutions containing heavy metals, and heat treatment chemicals containing cyanides. Investigation of the areas that potentially released chemicals to soil is proceeding under the Well Investigation Program of the RWQCB. In a letter dated June 11, 1990, the RWQCB requested a work plan for soil investigations at several chemical use and storage areas, including two underground emergency containment tanks, a scrap metal storage area, two aboveground storage tanks containing cutting oil and CFC-113, a chemical storage area, and an unlined trench containing hydraulic lines. Hydra-Electric responded by submitting a work plan for subsurface soil investigation dated August 3, 1990. On December 19, 1990 the RWQCB gave conditional approval to the work plan. Twelve soil borings were drilled, eleven to ten feet and one to five feet below ground surface. Concentrations of TPH and PCE up to 22,000 mg/kg and 96,000 µg/kg, respectively, were detected beneath Hydra-Electric. Additional subsurface soil investigations were advised by Hydra-Electric's consultant to determine the lateral and vertical extent of the contamination.

5.1.6 Image Transform Laboratory

Image Transform Laboratory (ITL) is a motion picture film processing laboratory, located adjacent to Parcel 2 Building 355. Chemicals used at ITL include TCA, PCE, and photochemical and acid solutions. A 7,500-gallon underground storage tank, which contained unleaded gasoline, previously existed at the southwestern portion of the property. A 5,000-gallon underground spill containment tank, located at the western portion of the property, is used for emergency containment of chemicals in ITL's film processing area. Other chemical use areas at the ITL site include a clarifier, concrete-lined trenches, chemical storage area, mixing room, processing room, wet printing room, film cleaning and solvent recovery rooms, a

hazardous waste storage area, and an acid storage area. On-site investigations conducted to date have determined that soils beneath ITL contain acetone, MEK, methylene chloride, 1,1,2,2-tetrachloroethane, toluene, TCA, total recoverable petroleum hydrocarbons, and cyanide. Concentrations for the VOCs range from at or near 5 µg/kg to 1,100 µg/kg of toluene. Total recoverable petroleum hydrocarbons were detected at concentrations up to 880 mg/kg. Concentrations of cyanide were detected up to 194 mg/kg in one soil boring. Other metals identified included antimony, arsenic, beryllium, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, thallium, and zinc at concentrations below or near the Title 22 Soluble Threshold Limit Concentration for those constituents. Investigation of the areas that potentially released chemicals to soil is proceeding under the Well Investigation Program of the RWQCB.

5.1.7 Lockheed Air Terminal, Inc.

Lockheed Air Terminal, Inc. (LAT) operates a fuel tank farm within the boundaries of Parcel 1, Plant B-6. Soils investigations have determined that fuels have discharged to soils at the LAT tank farm. The activities at the fuel tank farm and the past investigations of soil in the area are discussed in the Plant B-6 Parcel 1 Environmental Assessment report. In a letter dated November 2, 1990, the RWQCB requested further information on LAT's work plan to remediate affected soils beneath the fuel tank farm and to install a downgradient monitoring well to evaluate potential effects on groundwater. LAT will commence with soil remediation and groundwater monitoring upon receipt of RWQCB approval.

5.1.8 Meissner Manufacturing Company, Inc.

Meissner Manufacturing Company, Inc. manufactures swimming pool filters at a facility on the corner of Kenwood and Cohasset Streets, north of Building 88 and east of Building 356. The facility was inspected by RWQCB staff on June 8, 1990. In a letter dated November 18, 1990, the RWQCB informed Meissner that its handling of chemicals and wastes was satisfactory and no further action was required.

5.1.9 Pacific Airmotive Corporation

Pacific Airmotive Corporation (PAC) has serviced, maintained, and tested jet engines for the aviation industry since 1931. PAC has two facilities adjacent to Parcel 2, one located approximately 200 feet east of Building 83 and the other located approximately 200 feet northeast of Building 322 at 2940 Hollywood Way. PAC's main facility is located at the 2940 Hollywood Way address and their jet engine test cell facility is located adjacent to Building 83. Chemicals used at PAC's facilities include naphtha, TCA, jet fuel, oil, paint thinner, hydraulic oil, chlorinated solvents, Stoddard solvent, methylene chloride, spent halogenated solvents, spent cyanide plating bath solutions and sludge from electroplating operations, and spent stripping and cleaning bath solutions from electroplating operations involving cyanide. A total

of 20 underground storage tanks which contained waste oil, solvents, aviation gasoline, and jet fuel have been used at the two sites since PAC began operations at the two sites. Currently, three underground storage tanks are present at PAC. Other chemical use areas at the PAC sites include three drum storage areas, four sumps, three clarifiers, five engine test cells, and two buildings where jet engines are repaired and rebuilt. Investigation of the areas that potentially released chemicals to soil is proceeding under the Well Investigation Program of the RWQCB and the direction of the Burbank Fire Department. On-site investigations have been conducted at the jet engine test cell facility and at the main facility since 1984. On May 21, 1991, a 3,868-gallon fuel spill occurred at one of the underground storage tanks at the main facility during refueling operations. Approximately 1,000 gallons of fuel was recovered while approximately 2,868 gallons was released to the soil. The Burbank Fire Department is the lead oversight agency in regards to this incident.

In 1984, a 3,300-gallon jet fuel leak was discovered adjacent to a fuel pumping station at the jet engine test cell facility. Approximately 980 cubic yards of contaminated soil was excavated to a depth of 25 to 30 feet at two locations. Soil samples collected at the bottom of one excavation and from a soil boring detected jet fuel concentrations from 10,000 mg/kg at the base of the excavation to 4,000 mg/kg at a depth of 75 feet. Two groundwater monitoring wells were subsequently drilled downgradient to monitor for the presence of jet fuel. Water quality samples from the downgradient monitor wells had no detected jet fuel; however, chlorinated hydrocarbons and toluene were detected. In 1989, the RWQCB requested an upgradient groundwater monitor well to establish the water quality of ground water migrating onto the PAC site.

Nine of the ten underground storage tanks at the jet engine test cell facility were removed by 1983. The tenth tank, which contains Jet A fuel, was installed in 1980 and has a capacity of 20,000-gallons. A site-wide investigation revealed no soil contamination was present in the vicinity of this tank. Soil borings drilled in the vicinity of the former tanks revealed toluene concentrations ranged from 2 to 62 $\mu\text{g}/\text{kg}$ at depths from five to twenty feet. The test cell facility also contains a sump and two clarifiers which have not been sampled.

The site-wide soil investigation conducted up to May 1991 at the main facility has included the drum storage areas, the eight former underground storage tank locations, the two current underground storage tank locations, the three sumps, and one clarifier. The soil beneath the drum storage areas had concentrations of toluene up to 87 $\mu\text{g}/\text{kg}$, PCE up to 170 $\mu\text{g}/\text{kg}$, TCE up to 29 $\mu\text{g}/\text{kg}$, and oil and grease up to 6,500 mg/kg. The soil beneath the former underground storage tank locations had concentrations of toluene up to 950 $\mu\text{g}/\text{kg}$, PCE up to 3,200 $\mu\text{g}/\text{kg}$, and TCE up to 11 $\mu\text{g}/\text{kg}$. Two of the three sumps were found to be in good condition and were not sampled, and the soil beneath the third sump had no detected VOCs or VACs. The soil beneath the clarifier had concentrations of PCE up to 59 $\mu\text{g}/\text{kg}$ and total recoverable petroleum hydrocarbons TPH up to 890 mg/kg. The two remaining

underground storage tanks, which contain Jet A fuel, were installed in 1969 and each have a capacity of 12,000 gallons. Soil beneath the two tanks contained concentrations of TPH up to 20,000 mg/kg at depths of 50 to 60 feet.

The State Water Resources Control Board has compiled a Toxic Pits list, which was reviewed for facilities within 500 feet of Parcel 2. No facilities were found on this list within 500 feet of the property.

5.2 U.S. ENVIRONMENTAL PROTECTION AGENCY, REGION IX (EPA)

The EPA was contacted to obtain records on file for Plant B-6 through the Freedom Information Act. Records received from the EPA included a notification of hazardous waste activity dated August 11, 1980 for Plant B-6 with EPA I.D. Number CAD000630061. Listed hazardous wastes included spent halogenated and non-halogenated solvents, spent stripping and cleaning bath solutions from electroplating operations involving cyanides, and unspecified ignitable and corrosive wastes. Information generated by the EPA which was founded in the files of other agencies is discussed below for Plant B-6 and adjacent facilities within a 500-foot radius of Parcel 2.

Groundwater in the area of the Burbank-Glendale-Pasadena Airport is known to contain industrial chemicals and is presently being characterized for cleanup in accordance with the North Hollywood National Priority List program under the supervision of the EPA, DHS, and RWQCB. A January 1988 letter from the EPA to Lockheed informed Lockheed that the EPA proposed Areas 1 through 4 of the San Fernando Superfund Sites for the National Priority List in 1984, and of their potential liability for groundwater contamination at the San Fernando Superfund sites, Areas 1 and 2. The letter stated that the EPA "has reason to believe that the company's facilities have stored, treated and arranged for transportation and disposal of hazardous substances during the period of the mid 1950's to the present."

Lockheed submitted a Hazardous Waste Application to EPA on November 17, 1980 for the Plant B-6 wastewater pretreatment facility in Building 353. The Plant B-6 facility does not store for more than 90 days or dispose of hazardous waste on-site. An EPA-IX-FORM 859 rating sheet dated April 2, 1981 was found in the files of DHS in Burbank. An unspecified area of Plant B-6, which may be the wastewater pretreatment facility, was given a score of 26 on a scale in which 0 represents non-hazardous and 99 represents an imminent hazard. Comments on the form stated that the best engineering judgement (BEJ) hazard score of 2 on a scale of 5 was assigned because the acid neutralization process being evaluated is a simple, easily controlled operation. EPA personnel stated that this form is no longer used and the significance of the score is not known.

The Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) list contains potential hazardous waste sites that have been brought to the attention of the EPA. The CERCLIS list included one facility within 500-feet of Plant B-6, Pacific Airmotive Corporation (PAC). A discovery on August 1980 and a preliminary assessment on April 12, 1984 by the EPA was conducted and no further action is currently being contemplated by the EPA at this site. The PAC site is discussed further in the part of this section describing the RWQCB file review (5.1.9).

5.3 CALIFORNIA DEPARTMENT OF HEALTH SERVICES

5.3.1 Permits and Inspections

The DHS has files for Lockheed Plant B-6, Aviall, and Pacific Airmotive Corporation (PAC). The DHS records for Plant B-6 contained documents relating to the permitting of the wastewater pretreatment facility at Building 353. The operation of the wastewater pretreatment facility is currently covered by an interim status document issued for Plant B-6 on April 6, 1981 until the permitting process is completed and a permit is issued. The Plant B-6 file also contained a report of a compliance inspection of Plant B-6 by DHS dated May 11, 1987. No spillage, staining, damaged hazardous waste containers or any other indicators of potential soil contamination were noted in the compliance inspection report. The PAC and Aviall sites are discussed above in the part of this section describing the RWQCB file review.

5.3.2 Hazardous Waste and Substances Sites List

The Hazardous Waste and Substances Sites List (Cortese List) is a compilation of data from the DHS, State Water Resources Control Board and California Waste Management Board. A review of the Cortese List indicated that four facilities appear on the list that are located within 500 feet of the boundary of Parcel 2. These four Cortese facilities are:

San Fernando Valley Groundwater Basin 1
North Hollywood Area

Aviall, Inc.
3111 Kenwood Street
Burbank

Camelot Press
2815 North Lima Street
Burbank

Pacific Airmotive Corporation
2940 Hollywood Way
Burbank

The San Fernando Valley Ground Water Basin 1 is discussed above in the part of this section describing the EPA file review. Since the focus of this report is potential soil contamination, it will not be discussed further.

The Aviall, Camelot Press, and Pacific Airmotive Corporation sites were placed on the Cortese list because of potential tank leaks under investigation by the State Water Resources Control Board. The ongoing tank investigations at these sites are discussed above in the part of this section describing the RWQCB file review.

5.3.3 Abandoned Sites Program Information System

The Abandoned Sites Program Information System (ASPIS) database contains a listing of potential hazardous waste sites identified by the Abandoned Sites Survey Program and the Rural Sites Evaluation Program. A review of the ASPIS List indicated that seven facilities appear on the list that are located within 500 feet of the boundary of Parcel 2. Three of the facilities, Aviall, Inc., PAC, and the San Fernando Valley Ground Water Basin 1, are discussed above. In addition to these facilities, four additional sites are listed:

G.W. Bandy, Inc.
3086 North Avon Street
Burbank

L&H Metal Spinning Company
3026 Hollywood Way
Burbank

Matrix Science Corporation
3311 Winona Avenue
Burbank

Aircraft Tank Service, Inc.
10201 Cohasset Street
Burbank

G.W. Bandy, L&H Metal, and Matrix Science sites were described on the ASPIS list as requiring no further action based on a DHS determination that no significant release had occurred at the site. The Aircraft Tank Service, Inc. site is now part of the Aviall facility and is discussed above with that site.

5.3.4 Hazardous Waste Information Systems

The Hazardous Waste Information Systems (HWIS) are lists developed by DHS of hazardous waste generators and hazardous waste treatment, storage and disposal facilities. A review of the HWIS list indicated that nine facilities appear on the list that are located within 500 feet of Parcel 2. These facilities are generators of hazardous waste and include:

Aviall, Inc.
3111 Kenwood Street
Burbank

Hydra-Electric
3151 Kenwood Street
Burbank

Connell Plating Company
3080 North Avon Street
Burbank

1X Measured Meals
3615 San Fernando Boulevard
Burbank

Hurst Label Company
3401 Winona Avenue
Burbank

G.W. Bandy, Inc.
3420 San Fernando Boulevard
Burbank

Pevrick Engineering
7410 San Fernando Road
Los Angeles

Meissner Manufacturing Company, Inc.
3750 Cohasset Street
Burbank

Image Transform Laboratory
3611 San Fernando Boulevard
Burbank

Connell Plating Company, 1X Measured Meals, Hurst Label Company, and Pevrick Engineering were investigated by the RWQCB and require no further investigation. Aviall, Hydra-Electric, G.W. Bandy, Meissner, and Image Transform Laboratory have been investigated by the RWQCB and are discussed above.

5.4 SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT

The SCAQMD was contacted for disclosure of notices of violation and permits to operate on file for Lockheed Plant B-6 and for Pacific Airmotive Corporation (PAC) facilities, located at 2940 and 3003 North Hollywood Way in Burbank, California. The SCAQMD provided 63 permits for Plant B-6 and 20 for PAC. Lockheed has 75 permits that are current for all of Plant B-6. The permitted equipment, locations, permit number, and status for the equipment located in Parcel 2 are summarized in Table 5-1. Parcel 1 permitted equipment are summarized in the Plant B-6 Parcel 1 Environmental Assessment report. The permitted equipment for PAC included nine paint spray booths, three underground fuel storage tanks, two jet engine testing facilities, two baghouses, two abrasive blasting systems, one degreaser, and one infrared oven.

One notice of violation of Rule 1124 was recorded in 1989 for excess solvent usage at Plant B-6 spray paint booths. Lockheed agreed to implement measures to achieve emission reductions, enclose spray paint gun cleaners, and centralize dispensing stations for solvents and coatings. According to the SCAQMD, Lockheed has met all interim deadlines and is on schedule to be in compliance by the end of 1991.

5.5 CITY OF BURBANK DEPARTMENT OF PUBLIC WORKS

The City of Burbank Department of Public Works has obtained the services of JMM Operational Services, Inc., to be the contract operator for industrial waste discharge operations within the City. Prior to 1991, Plant B-6 had seven industrial waste permits which required monitoring at two sampling points in the City of Burbank and one in the City of Los Angeles. The sampling points in the City of Burbank were located at the south end of Kenwood Street, north of Building 352, and in Building 371, east of Hollywood Way. Building 371 and associated facilities east of Hollywood Way are not addressed in this assessment. The sampling point in the City of Los Angeles was located in Building 360, northwest of Parcel 2. Currently, Lockheed is monitoring three sampling points at Plant B-6 and submitting monthly and quarterly self-monitoring compliance inspection reports to the City of Burbank Department of Public Works. These sampling points are located at the south end of Kenwood Street, north of Building 352, and at Buildings 353 and 371. The sampling points at Buildings 353 and 371 monitor the waste streams of metal finishing process lines. The waste stream from Building 353 is treated prior to entering the third sampling point, the sewer at the south end of Kenwood Street.

¹ This list of permitted equipment was compiled from a disclosure of permits issued by the SCAQMD and the list of currently permitted equipment itemized by the LADC Environmental Safety and Health Air Group.

² "Applied" indicates a permit application has been submitted but a permit has not yet been issued.

³ No entry indicates that the LADC Environmental Safety and Health Air Group did not report the permit as active.

As stated in the Plant B-6 Parcel 1 Environmental Assessment Report (McLaren/Hart, 1991), the EPA inspected Lockheed's Burbank facilities in 1990 and concluded that Lockheed did not identify all points of discharge from its regulated metal finishing processes to the sewer system. These conclusions were presented in a Compliance Sampling Inspection Report dated October 10, 1990 and a Finding of Violation and Order dated October 26, 1990. Inspections by the EPA and JMM Operational Services to establish new sampling points and to determine which processes at Plant B-6 should be regulated under metal finishing regulations continued beyond July 1991. JMM Operational Services personnel stated that Lockheed Plant B-6 will be repermited in September 1991.

5.6 CITY OF BURBANK FIRE DEPARTMENT

The City of Burbank Fire Department assumed responsibility for underground storage tank program enforcement from the Los Angeles County Department of Public Works on January 1, 1990, and now maintains the records of applications and permits for tank installation, removal, or closure in place. The files included copies of selected Lockheed leak detection investigation reports and hazardous materials underground storage tank reports. These reports are discussed above in the summary of previous and ongoing site investigations. The files also contained tank permit applications for 35 tanks at Plant B-6 submitted by Lockheed on July 27, 1990, as well as inspection records for the installation of selected tanks at Plant B-6 from 1945, 1954, 1977, and 1979. Information obtained from the City of Burbank Fire Department on specific tanks in Parcel 2 is presented in the site inspection sections for individual buildings, where applicable, and in the Underground Storage Tank Investigations portion of the Site Background section.

The City of Burbank Fire Department files also contained correspondence, permits, and reports pertaining to the underground tanks at Aviall, Inc., Pacific Airmotive Corporation, and LAT. These sites are currently being investigated by the RWQCB and are discussed above.

5.7 CITY OF LOS ANGELES FIRE DEPARTMENT

The City of Los Angeles Fire Department maintains records for underground tanks for the area north of Cohasset Street. No current records were found in department files for underground tanks located in the City of Los Angeles for the northern portion of Plant B-6 or adjacent properties.

Historical records were found for 7505-7507-7509 San Fernando Road, located approximately 400 feet northwest of Building 356. A permit dated June 16, 1933 was found for two 1,000-gallon and one 550-gallon tanks for an auto fueling station. The tanks held Type 12 gasoline. A note in the file indicated that the tanks were

temporarily abandoned with water on September 4, 1942. A notice of noncompliance was issued for San Val Auto Wrecking on November 18, 1971 for operating the three tanks without a permit. The tanks were being used for fuel storage and two gasoline pumps at the site did not appear to be operating. Another notice of violation dated September 14, 1979 ordered the tanks to be properly abandoned. A notification of underground tank abandonment dated May 8, 1980 indicated that three 1,000-gallon tanks were degassed with dry ice and removed to a scrap yard. Presumably, one of the 1,000-gallon tanks identified as being removed was the 550-gallon tank identified in the 1933 permit. Information in the file did not indicate that soil sampling or tank integrity testing was performed at the San Fernando Road site. No information on product release was noted.

Permits were found for the installation of two underground tanks at 10201 Cohasset Street, which is currently part of the Aviall facility. A permit for a 1,000-gallon gasoline tank dated July 20, 1954 was granted to Aircraft Tank Service Corp. A permit for a 2,000-gallon gasoline tank was granted July 17, 1957. These are believed to be the tanks designated Tank 1 and Tank 2 by Aviall, and they are discussed above in the part of this section describing the RWQCB file review.

SECTION 6

CONCLUSIONS

The environmental assessment of Plant B-6 Parcel 2 has identified potential contaminant source areas where chemicals may have impacted soils. The potential contaminant sources can be grouped into general items of environmental concern as follows:

- Current and former virgin and waste chemical storage areas -
Chemicals may have spilled, leaked, or otherwise been released at storage areas and may have migrated to soil;
- Surface stains and/or corrosion -
Stains and/or corrosion suggest possible previous chemical releases that may have impacted subsurface soils;
- Surface runoff -
Surface runoff from chemical use areas may transport fuel, oil and grease, solvents, paints, metals, and other chemical compounds to soil;
- Floor drains and drain pipe systems -
Drains and drain pipe systems may directly receive chemicals from process areas, and may have the potential to release chemicals to underlying soil through leaks or breaks in piping;
- Trenches, pits, and sumps -
These below-grade structures may directly receive chemicals from operational areas, and may have the potential to release chemicals to underlying soil through unlined floors or discontinuities in concrete walls or floors;
- Process lines -
Chemicals may have spilled or leaked from the tanks or containment pits associated with metal process lines, resulting in a potential impact to underlying soil;
- Compressors, vacuum pumps and other auxiliary equipment -
Blowdown, condensate, oil, and chemical discharges associated with compressors, vacuum pumps, chillers, cooling towers, boilers, and pumps may have impacted soil at this equipment;

- Clarifiers -
Solid and liquid waste streams that are directed to clarifiers may contain chemicals that could potentially migrate through discontinuities in the clarifier walls or floors or through uncoated concrete into underlying soil;
- Former and current spray booths, paint booths, paint mixing areas, and paint application areas -
Paint, layout fluid, and solvents typically associated with spray booths and open painting areas may have potentially migrated to underlying soil;
- Aboveground tanks -
Chemicals stored in aboveground tanks may have been discharged by a breach in tank integrity, or chemical spills may have occurred in association with filling and dispensing activities, resulting in a potential impact to underlying soil;
- Underground storage tanks -
Tanks may have leaked chemicals to soil through fill pipe connections, overfilling, or a breach in tank integrity;
- Degreasers -
Solvents associated with degreasing operations may have potentially migrated to underlying soil;
- Equipment storage and salvage areas -
Stored equipment may leak chemicals to the ground;
- Other chemical use areas -
Other chemical use areas at which maintenance operations, fuel and oil system testing, metal plating, and stripping operations have occurred have the potential to release chemicals to soil; and
- Other environmental concerns -
Other environmental concerns include electrical substations, former dry wells, and cesspools that may release chemicals to underlying soils, and former chemical disposal sites.

The identified items of concern occur throughout Parcel 2 of the Plant B-6 facility. Figure 3-3 shows historical surface discoloration areas based on aerial photograph review. Figure 3-8 shows locations of underground storage tanks, sumps, and clarifiers that were identified during previous site investigations. Figures showing specific areas of concern at individual buildings or other potential source areas are presented in Section 4.

The remainder of this section summarizes the identified potential contaminant source areas within and adjacent to Parcel 2 and discusses each in context of the generalized items of concern listed above. A matrix showing the areas of environmental concern is presented in Table 6-1.

6.1 BUILDING 82

Items of environmental concern at Building 82 include surface stains, former floor drains, former and current trenches, sumps and pits, a metal finishing process line, an air conditioning compressor in an equipment room, former painting areas, a transformer room, a former hydraulics testing laboratory, and a former metal shop. Areas of historical staining were identified on asphalt and concrete paving to the north, southeast, and south of Building 82A where aircraft staging operations were performed in association with concrete pads near blast fences. Staining in this area may have impacted the underlying soil. Oily stains on the concrete floor inside Building 82 near draw formers, routers, hydrotels and other metal machining equipment indicate the potential for chemical release to underlying soil. A machine pit associated with a Verson press in the western portion of Building 82 receives oils and other chemicals from the press. These chemicals may have discharged to underlying soil through discontinuities in the pit bottom. A hydraulic line pipe trench in Building 86 contains hydraulic oil, which may have impacted the underlying soil. A former metal finishing process line tank containment pit and sump, B-6-J, were filled in 1983. Discharges to the containment pit and sump from the process line tanks may have resulted in chemical discharge to underlying soil. A floor drain, sediment trap and sand filter in a former paint room at the south end of a 40-foot wide office bay between Buildings 82 and 82A may have contributed chemicals to underlying soil. Stains on the concrete floor near an air conditioning compressor in an equipment room in Building 82C indicate that chemicals may have discharged to soil in the area. Stains on the asphalt pavement near a former paint booth outside the northwest corner of Building 82 indicate a potential impact to underlying soil in that area. Two additional former painting areas, one north of Building 82C and one in the southern portion of the 40-foot wide office bay, may have discharged chemicals to the underlying soil. A transformer room in Building 82C formerly contained equipment that may have been insulated with PCB-containing fluid. It is not known if the equipment leaked. Any leakage potentially could have impacted underlying soil. Operations in a former hydraulics testing laboratory and a metal shop north of the former paint room may have resulted in discharge of chemicals to underlying soil.

6.2 BUILDINGS 83 AND 84

Items of environmental concern at Buildings 83 and 84 include former and current hazardous material storage areas, historical and current surface stains, surface runoff from a large portion of Plant B-6, floor drains, trenches, sumps, pits, air compressors, boilers, a clarifier, painting areas inside and outside the building, paint booth wet wash filter systems, a former 5,000-gallon underground blowdown tank, equipment storage areas, a dope fabrication room, and a transformer room. Former and current hazardous material storage areas are located west of Building 83, and stained asphalt has been observed in the area on aerial photographs and during the site inspection. Chemicals stored in these areas may have been released to underlying soil. Stains have been observed on the concrete at a hazardous material storage area in the northeast corner of Building 83, and chemicals stored in this location may have impacted underlying soil. Staining associated with the use of paints, coatings, and oils was observed on concrete floors and asphalt-paved areas located inside and outside Building 83. Chemicals may have discharged to underlying soil in these stained areas. A compressed air pit with a gravel bottom north of Building 83, in which dark staining was noted, may have provided a conduit for discharge of chemicals to the soil. A storm drain flume south of Building 83 receives runoff from a large portion of Plant B-6 Parcels 1 and 2, including former flight line areas, chemical storage areas, and vehicle parking areas. The flume also received chemicals from paint stripping operations inside Building 83 and discharge from a pipe pit drain associated with compressors in the southeast corner of the building. Stains and leaking drums were noted on historical photographs in the area of the asphalt-paved storm drain flume and in adjacent asphalt-paved storage areas to the north, suggesting a potential impact to underlying soil in these areas. Equipment storage, aircraft maintenance, painting and paint stripping operations have occurred at a concrete pad at the northwest corner of Building 83 and may have released chemicals, resulting in a potential impact to underlying soil. Exhaust pits and utility pits in the hangar floor, floor drains in the exhaust tunnels, a former pipe trench and floor drain in a former boiler room, a pipe pit between two 300-hp air compressors in the compressor room, and a sump containing a duplex sump pump may have received chemicals from painting and stripping operations inside Building 83 or from the compressors, boilers, and other equipment associated with the pits, sumps or trenches. Soil underlying these pits, sumps, and trenches may have been impacted by chemicals that collected in these structures. Temporary containment of liquid waste in a former exhaust pit in the 1980s may have resulted in discharge of chemicals to soil. The use of paint, cellulose nitrate dope, and paint strippers associated with a former painting howdah and a former dope fabrication room in the southeastern portion of Building 83 may have resulted in discharge of chemicals to soil. Painting activities at spray booths on the north and south ends of the Building 83 high-bay and usage of former associated wet wash filter systems may have resulted in discharge of chemicals to underlying soil. Transformer cooling fluid that contained PCBs is known to have leaked onto the concrete floor of a transformer room on the second story of Building 83, and stains are still visible in the room. The concrete

floor in this area may be contaminated with PCBs. Chemicals have been detected in soils underlying a 5,000-gallon underground tank (B-6-B) near Building 84, but the nature and extent of the chemicals have not been completely characterized.

6.3 BUILDING 88

Items of environmental concern at Building 88 include chemical and hazardous material storage areas, historical and current surface stains, surface runoff from fuel systems testing areas, floor drains, trenches, a vacuum pump, an oil-fired steam boiler, a clarifier, fuel system testing areas inside and outside the building, a fuel pump and filter, and current and former underground fuel storage tanks. A drum storage area was formerly located in the fuel systems laboratory (FSL), and chemicals stored in this area may have discharged to underlying soil. Stains were observed on the concrete at a hazardous material storage area in the southeastern portion of the fuel systems yard (FSY) and on the concrete floor of a storage area near the entrance to the exhaust tunnel inside Building 88. Chemicals may have impacted underlying soil in these stained areas. Historical surface staining was visible on the asphalt pavement in the vicinity of the FSY south of Building 88 on aerial photographs. Staining in this area indicates the potential for discharge of chemicals to the underlying soil. Surface runoff from the FSY and nearby yard, as well as spilled fluids from the FSL, FSY, and a power plant laboratory (PPL) inside Building 88, entered floor drains, utility trenches, a former drainage channel, and a clarifier designated B-6-Q. Chemicals used in these areas may have been entrained in the surface runoff and may have impacted underlying soil. Chemicals have been detected in soils beneath clarifier B-6-Q, but further characterization will be necessary to more fully define the nature and extent of the chemicals. Staining was observed on the concrete floor in a maintenance shed at the east end of Building 88, in the location of a former oil-fired steam boiler. Chemicals may have been released to underlying soil in this area. Stains were noted on the concrete floor in the test section of the PPL, and fuel spills have occurred in the area, suggesting a potential impact to underlying soil. Stains were noted in a floor sink and the surrounding concrete floor near a generator in a Building 88 utility room. Oils and other chemicals may have discharged to soil in this area. Stains were noted on the asphalt pavement around a fuel pump and filter outside the southeast corner of the PPL and near a vacuum pump at the east end of Building 88. Chemicals may have discharged to underlying soil in these stained areas. Chemicals used in fabricating and assembling parts in the PPL shop may have been discharged to the floor. These chemicals may have impacted underlying soil. An aboveground methanol tank located near the former drum storage area has a potential to release chemicals during transfer to heat exchangers. Chemicals have been detected in soils between former and current underground fuel storage tanks B-6-F28 and B-6-F29 near Building 88, but the extent of chemical occurrence has not been completely characterized.

6.4 BUILDING 304 AND ADJACENT BUILDINGS

Items of environmental concern at Building 304 and adjacent buildings include chemical storage areas, surface stains, surface runoff, floor drains, trenches, pits, sumps, a former compressor, a former paint booth, former aboveground tanks, underground tanks, a degreaser, a hydro-gig testing area, a dye-penetrant test area, former oil-filled transformer equipment, and eight-inch diameter vertical steel pipes within the building floor. Chemical storage has primarily occurred in Building 305, however, temporary drum storage has also occurred in the hydro cabañas located on the north side of Building 304, in an area of flight line activities outside the southwest portion of Building 304 in the current location of Building 308, and at the loading dock located outside the southeast corner of Building 304. Solvent was also reportedly stored in aboveground tanks in the northwestern portion of Building 304, for use in tank seal operations in that area.

Heavy paint staining is evident on the concrete floors and walls of the Building 305 former chemical storage area. Minor to moderate staining is present on the concrete beneath the Stoddard solvent degreaser tank located in the covered area west of Building 306. Some minor to moderate oil staining is present on the asphalt pavement east of Building 306 and east of Building 399T, in the areas of parked and temporarily stored equipment. The concrete-paved area around the air conditioning condenser outside the southeast portion of Building 304 is stained with oil.

Heavy oily staining is evident on the concrete floors and within the rock-filled drain sumps in the hydro cabañas located north of Building 304. Floor drains in the hydro cabañas discharged to underground tanks B-6-M and B-6-N. Investigations conducted at these tanks by Gregg and Associates and by ENSR showed the presence of TPH and VOCs in soil. The area north of the easternmost hydro cabaña reportedly received spills of hydraulic oil from operations within the hydro cabaña.

Concrete-lined storm drain trenches outside the west and northwest ends of Building 304 intercept surface runoff from areas to the north and northwest. Dye penetrants, which were formerly sprayed in the area along the north side of Building 306, entered a grated trench along the north side of that building and were discharged to the trench along the west side of Building 304. Oil, fuels, and other chemicals that were used in the flight line areas west of Building 304 may have been entrained in surface runoff that discharged to the western storm drain trench.

Concrete-lined utility trenches and utility pits with soil bottoms are located throughout Building 304. Chemical usage in the areas of these pits and trenches, or leakage of hydraulic piping within the trenches in the northeastern portion of the building, may have resulted in discharge of chemicals to underlying soil. Heavy oil staining is evident in a portion of the concrete-lined utility trench in the northeast corner of Building 304.

A large concrete-lined pit and large concrete patches which may reflect additional former pits are present in the extreme western end of Building 304. Current and former Lockheed employees were not able to identify possible usage of these pits or of potential former pits indicated by large concrete patches in the south-central portion of the building. The usage of a 3-foot deep pit in the north-central portion of Building 304 is also unknown. Chemicals may have been used in the vicinity of these pits, and may have been discharged to soil through discontinuities in the pit bottoms. A former 2-foot deep flywheel clearance pit was located in the floor of the former compressor room. This pit may have collected oils or compressor condensate. A floor sink which received discharge from a former cooling tower in this area is located in the southeast corner of the former compressor room. This floor sink also may have received discharged oils. A floor drain is located in the northwestern portion of Building 304, adjacent to the north wall. Chemical usage in this portion of the building, including the use of solvents in tank seal operations, may have resulted in discharges to this floor drain.

A wet-wash paint booth was formerly located in the north-central portion of Building 304, along the north wall. A 2-foot by 2-foot by 2-foot deep sump, located immediately east of the former paint booth, is believed to have received overflow from the wet-wash filter system. Use of paints and potential use of solvents in the paint booth area may have resulted in discharges to soil.

The former 100-gallon underground gasoline tank for the emergency generator south of Building 304 was not addressed in 1984 and 1989 plant-wide tank investigations. Potential leakage from the tank or from the supply lines may have impacted soil in this area. Previous investigations at former underground diesel tank B-6-F25, located outside the southwest corner of the building, showed the presence of 1.27 ppm TPH. Although reported TPH concentrations are relatively low, the presence of detectable concentrations may suggest the presence of soil contamination in the area resulting from leakage from the tank.

Hydro-gig testing in Building 306 involved the use of hydraulic oils and minor spills were reported to have occurred. For a short period of time (approximately two months), hydro-gigs were steam cleaned in the asphalt paved area immediately north of the Building 306 testing area. Hydro-gig testing and cleaning in these areas may have resulted in discharge of oils and greases to underlying soil. Hydro-gigs were formerly stationed in two areas south of Building 304 to supply hydraulic pressure to test areas in the southern portion of the building. Hydraulic oils may have been discharged to the pavement in these areas.

The transformer in Building 314, south of Building 304, formerly contained oil-filled circuit breakers. It is not known whether the oil contained PCBs or whether leakage occurred in this area. Soils in the area may, however, have been impacted.

Near the centerline of Building 304, there are two parallel lines of 8-inch diameter steel pipes whose tops are flush with the concrete floor. Four of the pipes that were accessible for inspection contained liquid that appeared to be hydraulic fluid. The purpose of the pipes is not known and it is not known if they have sealed bottoms. These pipes represent a potential conduit for discharge of oil and chemicals used within the building to underlying soil.

6.5 BUILDING 309/310

Items of environmental concern at Building 309/310 include historical and current surface stains, surface runoff from chemical use areas, pits, process lines, spray booths, former underground tanks, and a degreaser. Historical staining on the asphalt near the loading dock is visible on 1942 aerial photographs. Oily stains are present on the concrete in the elevator pits, on the concrete floor near two large drill presses and a metal shearing machine in the machining area of Building 310, on the concrete at a former air conditioning cart enclosure on the north side of Building 309, at the concrete-lined former tank level inspection box of former tank B-6-F19, and on the asphalt pavement at a covered shed at the west end of the loading dock, where Factory Transportation parks equipment. Staining in these areas may have impacted the underlying soil. A storm drain trench at the west side of Building 309 receives surface runoff from the yard areas to the west and north. These yard areas have been used in the past for flight line and aircraft final assembly operations that utilized oils, fuels and solvents. Two pits of unknown use are located at column K9 in Building 310. These pits are located near a former process line, degreaser and degreaser still, and chemicals from these or other operations may have collected in the pits and impacted the underlying soil. Utility pits with soil bottoms are located throughout Building 309/310. Historic and present chemical use near these pits may have released chemicals to the soil. A pit that formerly contained a boiler blowdown tank is located outside the north side of Building 310. This pit may have received chemicals from the boiler blowdown tank or from other sources, and these chemicals may have impacted the soil surrounding and underlying the pit. Two former metal finishing process lines were located in Building 310. Chemicals from the process lines that discharged to the process line containment pits and sand traps may have impacted the soil beneath these structures. Two former and present paint booths along the southern wall of Building 309/310 may have released chemicals to the soil underlying the paint booths or their former wash water sand traps. Four of the 12 underground fuel oil tanks adjacent to Building 309/310 may have impacted surrounding or underlying soil, based on laboratory results from former investigations. Laboratory soil sample analyses at former tanks B-6-F10, -F13, -F14, and -F18 detected TPH at concentrations as high as 2,120 mg/kg, 490 mg/kg, 2,213 mg/kg, and 993 mg/kg, respectively. TPH was detected at low concentrations (less than 23 mg/kg) of seven other of these 12 fuel tanks. A TCE degreaser and

degreaser still at a former process line in Building 310 may have discharged solvent to a containment pit and associated sand trap. Solvent from this degreaser may have impacted the soil underlying these structures.

6.6 BUILDING 311

Items of environmental concern at Building 311 include a former chemical storage area, a catch basin near the chemical storage area, surface stains associated with an air conditioning unit, a clarifier, a former underground tank, an elevator, and the sewer drain from the photography laboratory. The former chemical storage area covered approximately a 5- by 8-foot area south of Building 311 at column 5. The catch basin, located within 5 feet of the former chemical storage area, receives surface runoff from the area, resulting in a potential impact to underlying soil. A surface oil stain is present on the concrete at the northern air conditioning unit on the east end of Building 311B and solvent use was evident at the air conditioning equipment enclosure. These chemicals may have impacted the underlying soil. The four-stage clarifier south of Building 311T was originally constructed to catch runoff from an aircraft wash rack. Chemicals that were formerly used at the wash rack and that drained to the clarifier may have been discharged to soil through discontinuities in the clarifier bottom or walls. Former underground tank B-6-F21 was installed and then moved to a second location at Building 311. The first location of Tank B-6-F21, at the south central part of Building 311B, has not been investigated and may have discharged chemicals to the soil. Investigations at the second location of tank B-6-F21 detected low levels of VOCs (as high as 19.5 $\mu\text{g}/\text{kg}$ methylene chloride) and TPH as high as 109 mg/kg. The concrete-lined pit of the elevator located at the northwest corner of Building 311 is heavily stained with oil. Chemicals may have discharged to soil from this pit. A photography laboratory is located on the second floor of the former mock-up area along the southern wall of Building 311. Sanitary sewer drains on the ground floor below the laboratory are of concern due to the presence of photographic chemicals observed in the drain pipes on the second floor of the building. These chemicals may have been discharged to the soil through breaks or leaks in the sanitary sewer piping.

6.7 BUILDINGS 312, 313, AND 315

Items of environmental concern at Building 312 include surface stains outside of the building. The stains were noted on the asphalt-paved floor of a grease shed outside the west wall of Building 312 and on the asphalt between the grease shed and a hydraulic pump and hydraulic reservoir located outside the northwest corner of the building. No items of environmental concern were found associated with Buildings 313 and 315.

6.8 BUILDING 322

Items of environmental concern at Building 322 include surface stains, floor sinks, floor drains, degreasers, and an elevator pit. Stains were noted on the sealed or vinyl tile-covered concrete floors of a hydraulics laboratory and a calibration laboratory, both of which also contained Freon degreasers. Chemicals used in these rooms may have discharged to the underlying soil. The concrete floor of a boiler room is heavily stained with oil near an emergency generator, and the room contains a floor sink and a floor drain. Discharge of oils in this area may have impacted underlying soil. An elevator pump room has a floor drain that discharges to soil, and the concrete floor of the adjacent elevator pit is stained. Chemicals may have discharged to soil in these areas.

6.9 BUILDING 322T

No items of environmental concern were found associated with Building 322T.

6.10 BUILDING 325T

No items of environmental concern were found associated with Building 325T.

6.11 FORMER BUILDING 326

No items of environmental concern were found associated with former Building 326.

6.12 BUILDINGS 332, 333, AND 339

Items of environmental concern at Buildings 332, 333 and 339 include a former chemical storage area, surface stains, utility/hydraulic hoist pits, unidentified pits, underground tanks, equipment storage areas, former dry wells, and former aircraft start-up areas.

Approximately 70 drums are visible at the blast fence north of former Building 331 on historical aerial photographs. Moderate to significant asphalt pavement surface staining is evident in this area on historical aerial photographs. Chemicals from this drum storage area may have impacted underlying soil. Surface staining is visible on historical aerial photographs in asphalt- and concrete-paved areas reportedly used for start-up and run-up of aircraft. Based on review of aerial photographs (dated from 1941 to 1961), these areas are between former Buildings 330 and 331 and blast

fences to the north and south; surface staining from start-up activities was also evident in the asphalt-paved area northwest of the former blast fence west of Building 332. Start-up and run-up activities included aircraft fueling and lubing, during which engine oil and sometimes fuel was blown to the ground and toward the blast fences.

The area around the former machine isolation pad on the concrete floor of former Building 331 has significant oil stains. The five concrete patches seen near the pad may be former utility pits, which may have received machining oils or other chemicals during former activities. Oil stains are evident on the concrete floor of former Building 330. The asphalt paving west and northwest of the blast fence west of Building 332 was moderately stained and degraded. A significant stain is present on the asphalt near a sewage lift pump in this area. Chemicals may have impacted the underlying soil in these stained areas.

Utility pits with earthen bottoms, hydraulic hoist pits, and a 13-foot-long unidentified pit are present in Building 332. Oil was seen in the bottom of one of the hoist pits. Oils and solvents were likely to have been used during aircraft equipment servicing in this building and may have entered the pits. In addition, an old utility pit with an earthen bottom is located north of Building 332, near former Building 332T; the pit may have received oils or other chemicals used or stored in this area. Oils, solvents, and other chemicals used near these structures may have discharged to the underlying soil.

Two underground tanks (fuel oil and waste oil) were formerly located north of Building 332; one underground oil fuel tank was east of Building 333; and one diesel tank was east of Building 339. All of the tanks were removed in 1989. Leakage at Tank B-6-F32, north of Building 332, reportedly impacted approximately 100-square-feet of soil adjacent to the tank. This contamination has not been fully characterized. Investigations conducted at the other tank locations did not indicate that adjacent soils had been impacted.

The five former dry wells south of Building 330 may have provided conduits for discharge of chemicals to the soil. The wells received rainwater from building downspouts, but may also have received drainage from adjacent areas that showed surface staining on aerial photographs. The dry wells were filled-in in 1982.

6.13 BUILDING 338

Items of environmental concern at Building 338 include chemical storage, metal plating operations, and a floor drain. Building 338 was used for oil drum storage and metal plating in the 1940s. Oil storage and use of chemicals in metal plating operations may have resulted in discharges to underlying soil. A floor drain near the

center of the building had the potential to release chemicals used and stored in the building to underlying soil through leaks or breaks in piping.

6.14 BUILDINGS 340 AND 341

Items of environmental concern at Buildings 340 and 341 include a surface stain, surface runoff, and a trench. A surface stain is present on the concrete near a former battery rack in Building 341. Chemicals may have discharged to the underlying soil in this stained area. A concrete trench in Building 340 has two openings to exposed soil that may have received surface runoff containing chemicals from aircraft final assembly operations to the north, resulting in a potential impact to underlying soil.

6.15 BUILDING 354

Items of environmental concern at Building 354 and former Building 343 include surface stains and chemical use areas. Chemical use and stained concrete floors in both building areas are associated with metal machining operations. Oils, solvents, layout fluids, and other chemicals used in Buildings 343 and 354 may have impacted underlying soils.

6.16 BUILDINGS 347, 348, 355, AND 356

Items of environmental concern at Buildings 347, 348, 355, and 356 include historical and current surface stains, a furnace pit, a spray booth, an underground fuel oil storage tank, and an equipment storage area. Evidence of dark surface stains on the asphalt pavement are visible on historical aerial photographs at the Building 347 site and in yard areas west and south of Building 347. Minor paint stains were observed on the asphalt surfaces between Buildings 355 and 356. Chemicals may have impacted the underlying soil in these stained areas. A furnace located in a shallow concrete pit in Building 347 and an associated underground fuel oil tank had potential to release fuel oil during operation. No investigation has been conducted at this former underground tank. Fuel oil may have impacted the underlying and surrounding soil at this pit and tank. A spray booth located in the northwest corner of Building 356 is used to apply light-sensitive developing fluid to sheet metal. An asphalt-paved equipment storage yard located north of Buildings 355 and 356 was observed to have small oil-stained areas. Leaked oils may have impacted the underlying soil.

6.17 BUILDING 349

Items of environmental concern at Building 349 and the adjacent yard area include chemical storage areas, surface stains, surface runoff, trenches, a paint booth and former paint booth sump, and an underground tank.

Prior to the construction of Building 349, the area was used for oil storage. Current chemical storage for Building 349 and other buildings in the LADC area of Plant B-6 is present in the virgin and waste chemical storage areas just south of Building 349. Paint, paint solvent, and paint epoxy storage has occurred in the south end of Building 349 in the paint storage and paint mixing rooms. Surface staining is present on the concrete floors in both of these rooms. Oily staining is present in the asphalt-paved area between the virgin and waste chemical storage areas, some of which may be due to ponding of surface runoff from the parking area for Building 349. Surface staining from paint is also present in the asphalt-paved area south of Building 349. Chemicals may have impacted underlying soils in these stained areas and these areas of current and former chemical storage. A concrete-lined, steel grate-covered trench in the southeast portion of the Building 349 yard collects surface runoff from former and current chemical use and storage areas. Chemicals that collect in that trench may have impacted underlying soil. A paint booth is located in the southern part of the building. The paint booth presently uses a dry-media filter system, but had a wet wash filter system and associated collection sump in the past. A spill containment trench is present in the paint mixing room which is connected to an underground spill containment tank (B-6-E). Chemicals may have impacted underlying soils at the paint booth and wash water sump, the paint mixing room trench, and the underground tank. Investigations conducted beneath the former wash water sump have detected elevated levels of chromium and certain other metals, but the extent of chemical occurrence has not been characterized.

6.18 BUILDING 352

Items of environmental concern at Buildings 352, 352A, and 352B include surface stains, a trench, pits and sumps, and a floor drain. The concrete floor in the western portion of the building is stained with oil near press #77 and near a furnace in Building 352B. Chemicals may have impacted the soil underlying the stained areas. An existing sump and pump that discharge to the sanitary sewer are located outside the northeast corner of Building 352. This sump replaced a sump formerly located in the western portion of Building 352B. A former pump pit was located near the north side of the building's restroom. Chemicals used within the building and potentially chemicals from the process line in adjacent Building 353 may have collected in these sumps and the pit. Chemicals may have discharged to the soil underlying these structures. A concrete-lined dye-penetrant containment basin in the northern portion of the building is stained and may have received chemicals from the

dye-penetrant operation. Soil underlying the containment basin may have been impacted by these chemicals. Two hydraulic presses (#72 and #77) are located in the western part of Building 352A and have minor accumulations of oil in the concrete-lined oil collection pits beneath the presses. A floor drain near presses #72 and #77 may have received chemicals used in that area. A third hydraulic press is located in the northeastern part of Building 352B and has significant accumulations of oil in the concrete-lined oil collection pit beneath the machine. A concrete-lined utility trench at this press may have received oils and other chemicals. Chemicals may have impacted underlying soil in these areas.

6.19 BUILDING 353

Items of environmental concern at Building 353 include temporary chemical storage, two hydraulic presses with associated oil accumulation pits, a metal finishing process line, a clarifier, a vapor degreaser, and two dry wells. Two hydraulic presses located in the southwest portion of Building 353 have minor accumulations of oil in the concrete-lined press pits. Chemicals may have discharged to underlying soil from these pits. Chemical use associated with aluminum and titanium treatment process lines and a vapor degreaser located in the northern portion of the building may have resulted in discharges to underlying soil. Temporary storage of solvents in an area just south of the building during maintenance of the degreaser may have resulted in discharges that potentially impacted underlying soil. A clarifier, B-6-F, that pre-treats rinse water from the process line before discharging it to the sanitary sewer is located outside the western edge of the building. Soil investigations have shown the presence of chemicals in soil in this area. The nature and extent of chemicals detected in soil near the clarifier have not been completely characterized.

6.20 PARCEL 2 YARD AREA

Items of environmental concern in the Parcel 2 Yard Area include surface runoff, historical stains, storm drain trenches, utility pits, painting activities, aboveground tanks, equipment storage areas, transformers, and flight line operations. The Parcel 2 Yard area has been used for flight line activities and equipment storage since the 1940s, and surface stains are visible on the asphalt pavement and concrete pads on historical aerial photographs, in the areas of former blast fences 309B, 330B, 331B, and S1E, and at the northwest corner of Building 309. Surface runoff from these flight line areas enters storm drain trenches on the north sides of Building 310 and 311, and chemicals that were potentially entrained in the runoff may have impacted underlying soil. Trenches and utility pits associated with the flight lines also may have received surface runoff and/or chemicals that may impact underlying soil. Former Building 302 was used for maintenance activities including metal machining and painting. Chemicals from these activities may have impacted underlying soil. Two vertical aboveground fuel tanks are visible on aerial

photographs from the 1940s and early 1950s, and stains were noted near the tanks. Chemicals may have discharged to the soil at these tanks and stained areas. Former Building 318, located near the southeastern corner of Parcel 2, contained electrical equipment that may have contained PCBs. Any chemical leakage from this electrical equipment may have impacted underlying soil. A former PCB-containing transformer associated with a Pacific Airmotive Corporation substation was located near the current automatic teller machine in Parking Lot 7. This transformer reportedly leaked and stained the concrete pad that supported the transformer. The concrete pad was removed, but chemicals may have impacted underlying soil.

6.21 PARKING LOT 8

The item of environmental concern at Parking Lot 8 is historical surface staining in an area of unidentified mounded material. Review of a 1945 aerial photograph indicated some surface discoloration of mounded soil material in an approximate 1.5-acre area within the central portion of the parking lot. It is likely that the mounded material consisted of excavated material from construction of adjacent buildings during that year, but it is uncertain if the mounds also contained other materials or chemicals that had been dumped in the central area of the lot. By 1948, the mounds had been leveled or removed. Chemicals may have impacted the soil underlying the mounded material and stained areas.

6.22 FACILITIES ADJACENT TO PARCEL 2

Items of environmental concern at facilities adjacent to Parcel 2 include chemical storage, surface stains, trenches, sumps, compressors, aboveground tanks, and underground tanks. However, most of these items are greater than 100 feet from the Parcel 2 boundary. The only items that potentially could impact the Parcel 2 soil are former vertical fuel storage tanks observed east of Hangar 6 (which was demolished in 1942) and oil staining on the asphalt and concrete pavement south of former Hangar 8, which may have impacted underlying soil.

1.0 INTRODUCTION

This report was prepared by ENSR Consulting and Engineering (ENSR), on behalf of the Burbank-Glendale-Pasadena Airport Authority, to provide a brief environmental history of the Trust Property, which is contained within the former Lockheed-Martin Plant B-6 facility.

This report also presents a summary of results from environmental assessments conducted on the site. These assessment results are a compilation from existing environmental reports and include the laboratory analysis data for subsurface soil vapor and soil boring samples. This report also presents a summary of hazardous building materials remaining on the property.

1.1 Background

The Trust Property comprises approximately 81 acres of the former 130 acre Lockheed-Martin Plant B-6 Facility. The Trust Property location and layout are illustrated on Figures 1 and 2. That portion of the site south of Cohasset Street is located in the City of Burbank and that portion located north of Cohasset Street is located in the City of Los Angeles.

Lockheed developed the B-6 facility in the early 1940s for aircraft research, manufacturing, and maintenance operations, primarily on behalf of the United States Department of Defense. Prior to 1941-1942 the majority of the B-6 site was undeveloped or used for dry land agriculture, such as grain crops, grazing and vineyards.

Site development included aircraft hangers, aircraft assembly and testing areas, maintenance areas, office space, and warehouses. The principal manufacturing activity at the B-6 facility was final aircraft assembly, however, other operations included research and development activities, minor subassembly work, aircraft testing, ground support, equipment assembly, and flight operations. Some of these activities involved cleaning, painting, welding, and machining. Hazardous materials historically stored and used at the subject site included aircraft fuels, fuel oils, gasoline, solvents, metals, acids, caustics, adhesives, and plastic resins and hardeners.

In 1997 and 1998, most of the buildings, foundations, and pavement were demolished and removed from the property. The buildings in the northern portion of the Trust Property, referred to as the former Building 360 Complex, are currently under demolition with an expected completion in July 2001.

2.0 SUMMARY OF ENVIRONMENTAL ASSESSMENT DATA

The former Plant B-6 has been investigated and assessed throughout the years by several environmental consultants for various purposes. These investigations have included subsurface soil assessments and hazardous building materials assessments.

2.1 Subsurface Assessment Data

ENSR reviewed assessment reports prepared by several Lockheed consultants. Tetra Tech Inc., an environmental consultant working for Lockheed, issued several reports regarding the environmental condition of the Plant B-6 site. The Tetra Tech reports included subsurface soil vapor and soil boring analytical data collected from approximately 1992 through 1996. ENSR also conducted an independent assessment of the Plant B-6 site on behalf of the Airport Authority from 1996 through 1998. During this assessment, ENSR also collected soil vapor and soil boring analytical data. The locations of the Tetra Tech and ENSR explorations, located on the Trust Property, are illustrated on Figure 3 - Soil Vapor Survey Locations and Figure 4 - Soil Boring Locations. Approximately 700 soil vapor and 300 soil boring exploration locations are included in the assessment data for the Trust Property.

The Tetra Tech and ENSR soil vapor samples were generally analyzed for volatile organic compounds (VOC) while soil boring samples were generally analyzed for a combination of total petroleum hydrocarbons (TPH), VOC, and in some cases, semi-volatile organic compounds (SVOC), polychlorinated biphenols (PCB), and metals.

The combined soil vapor and soil boring analytical data collected on the Trust Property by Tetra Tech and ENSR are summarized in the following attached tables:

- Table I – Trust Property Soil Vapor Analytical Results
- Table 2A – Trust Property Soil Sample Analytical Results, Petroleum Hydrocarbons
- Table 2B – Trust Property Soil Sample Analytical Results, Volatile Organic Compounds
- Table 2C – Trust Property Soil Sample Analytical Results, Semi-Volatile Organic Compounds
- Table 2D – Trust Property Soil Sample Analytical Results, Polychlorinated Biphenols
- Table 2E – Trust Property Soil Sample Analytical Results, Metals

Only those samples that recorded a concentration greater than the method detection limit are presented in the above summary tables. The vast majority of samples collected recorded a non-

detect (ND) analytical result, however, for space considerations, these data are not presented in the summary tables.

The Los Angeles Regional Water Quality Control Board (LARWQCB) is the regulatory agency responsible for oversight of environmental issues associated with the former B-6 site. The LARWQCB reviewed all the environmental data collected from the various assessments and issued "no further action" (NFA) letters for the site in 1996. These letters were issued per legal parcel, and are included as Appendix A - LARWQCB - NFA Letters. The parcels are illustrated on Figure 2.

As a follow up to the original data collection and interpretation, specific areas of potential environmental concern were additionally reviewed at the request of the LARWQCB. These areas included the alley between former Buildings 309/310 and 311 and the sewage sump area in the former Building 352 Complex. The environmental data from these two areas were specifically reviewed, compiled, and reported to the LARWQCB in a document prepared by KW Brown & Associates Inc., dated December 4, 1998. This report is included as Appendix B - KW Brown Report, December 4, 1998. The LARWQCB has not responded to this report.

At the request of the LARWQCB, KW Brown & Associates also conducted a review of all soil boring data for contaminant concentrations greater than the original screening levels established for the project. Areas that had been subsequently remediated were excluded from the data review. KW Brown presented the results of the data screening to the LARWQCB in a report dated January 4, 1999. This report is included as Appendix C - KW Brown Report, January 4, 1999. The LARWQCB has not responded to this report.

In April 2001, at the request of the BGPAA, ENSR collected soil samples in areas where previous data indicated the potential for elevated levels of thallium and chromium. A soil boring and sampling plan was implemented, and results reported in the document Thallium and Chromium Sampling Results, dated May 4, 2001. This report is included as Appendix D - ENSR Report, May 4, 2001.

2.2 Hazardous Materials Assessment Data

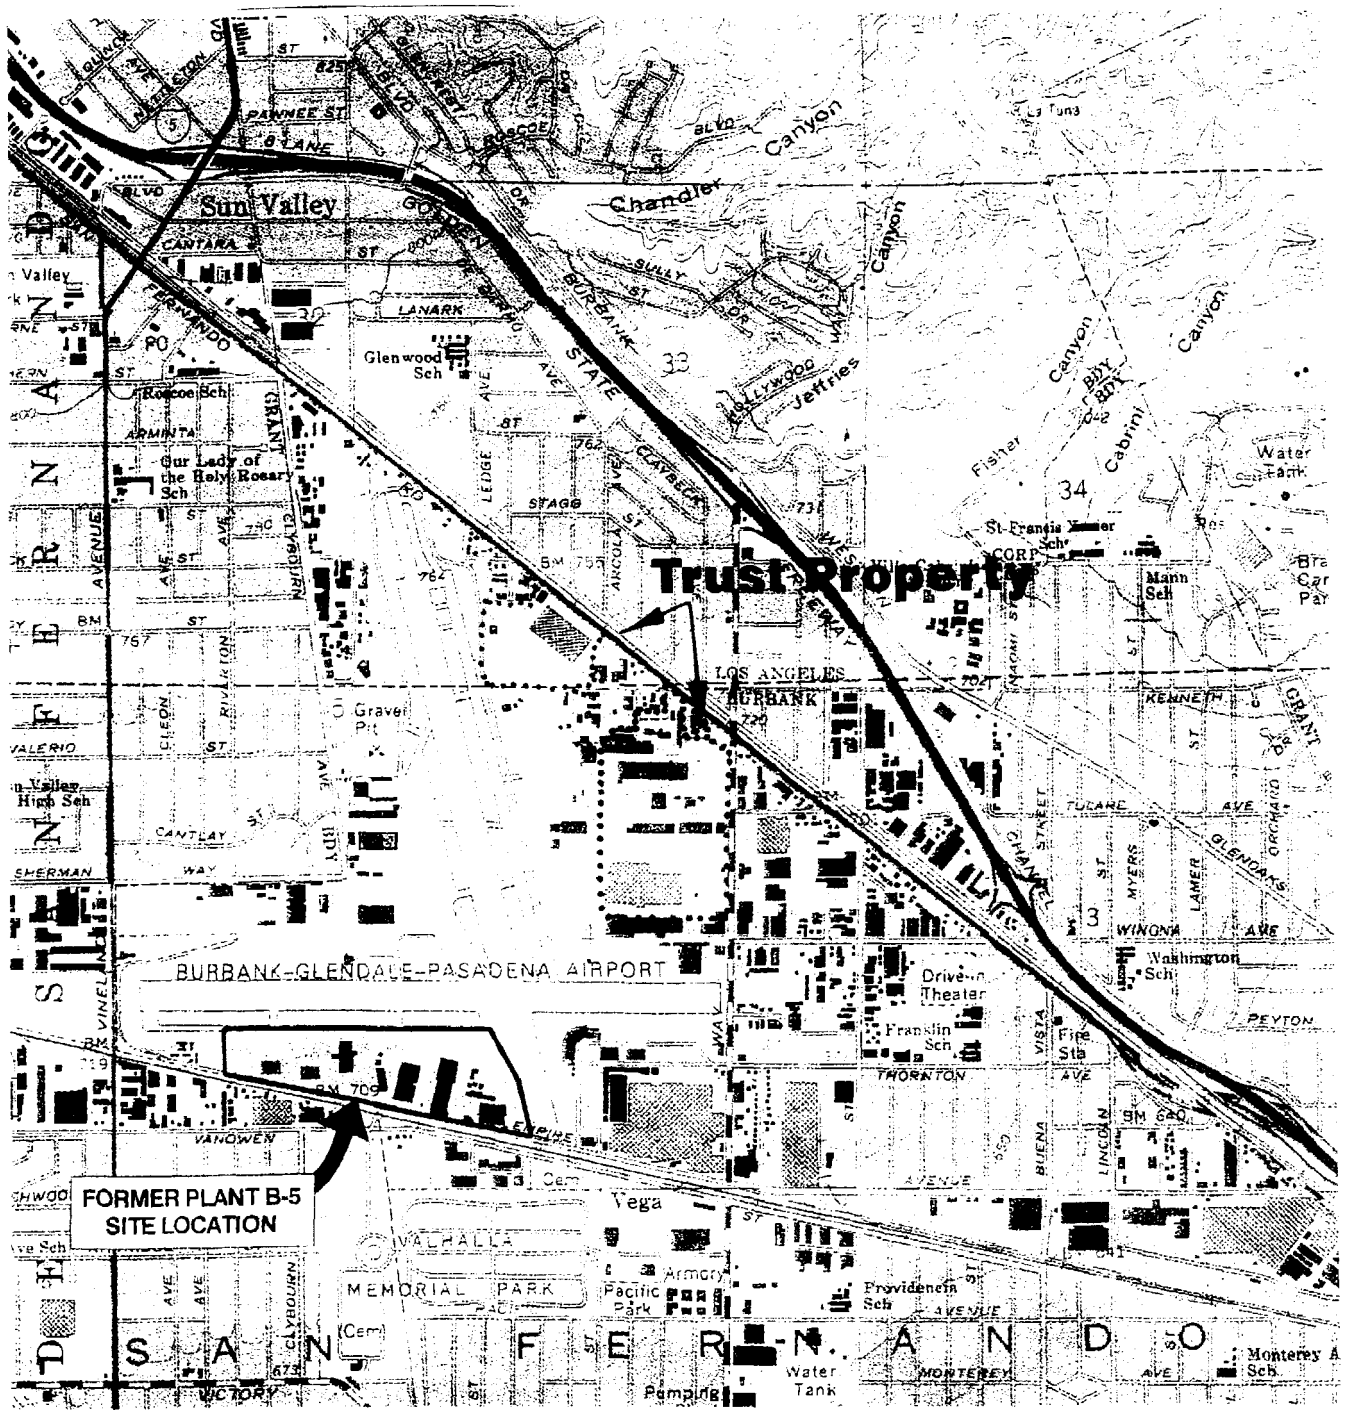

ENSR reviewed several hazardous material survey reports prepared by various Lockheed environmental consultants. ENSR also conducted independent hazardous materials surveys on behalf of the Airport Authority in 1998.

Many of the surveyed hazardous materials were abated from the site as part of the overall demolition activities in 1997 and 1998. However, some hazardous materials remain on the site, mainly located within the former Lockheed-Martin Building 360. These materials are asbestos

and lead-based paint related. The Building 360 Complex is currently under demolition and is scheduled for completion in July 2001.

There is also evidence of asbestos-wrapped buried piping and transite piping beneath the existing pavement on the Trust Property. The exact location of the buried piping is not known.

The known hazardous materials currently remaining on the site are summarized on Table 4B – Trust Property Hazardous Materials Summary, however, beyond July 2001 these materials will be abated with the demolition of the Building 360 Complex.

Blackman
Lovesque, HilbertNo Further Requirements, Parcels D and F, Lockheed Plant B-6 West,
(File No. 104.0574) (Cleanup & Abatement Order No. 87-151)

We have reviewed your July 5, 1996, letter requesting closure for Parcels D and F of Plant B-6 as notated on the attached map. Upon review of the subject proposal and other information in our files, we have the following comments with respect to the Well Investigation Program:

Parcel D

1. A total of 228 soil matrix samples were collected from 28 boreholes during assessment in this area. The highest TPH concentration detected was 3,580 mg/kg at 2' bgs. The only VOCs detected in these samples were acetone (maximum 40 ug/kg), MEK (maximum 12 ug/kg), toluene (maximum 21 ug/kg) and xylenes (maximum 23 ug/kg). No significant levels of PCB's, metals or other contaminants were detected.
2. A total of 104 soil gas locations were sampled in the subject parcel. Elevated concentrations of PCE (maximum 166 ug/l), TCE (maximum 4 ug/l), 1,1,1-TCA (maximum 5 ug/l) and methylene chloride (maximum 133 ug/l) were detected in shallow samples. The highest VOC concentration in samples collected at depth below the highest shallow VOC concentrations was approximately 7 ug/l at 20' bgs. Ground water is at approximately 250' bgs in this area.
3. The ground water monitoring well located on this property may be a key well in the network established by USEPA and may be needed to evaluate adjacent properties. One or more additional wells may be required in the future to accomplish these objectives if this well is destroyed for new construction.

LEGIBILITY TEST: For quality of
original documents being filmed.

Mr. Ron Helgeson
Lockheed Martin Corp.
Page 2

Parcel F

1. Acetone (maximum 16 ug/kg) was the only VOC detected above detection limits in the 28 soil matrix samples collected from 3 soil borings in this area. Total petroleum hydrocarbons (maximum of 252 mg/kg at 2' bgs) were detected in near surface samples. No other compounds were detected in any of the soil samples.
2. No VOCs were detected in any of the soil gas samples collected from eighteen locations during the initial soil gas investigation in this parcel.

Based on our inspections and information submitted, we have no further requirements with respect to the Well Investigation Program for the subject two parcels. The soil contamination detected on these parcels is not a threat to ground water quality and therefore cleanup is not necessary. This "no further requirements" determination for these two parcels does not affect requirements for assessment and cleanup on the other adjacent parcels covered by our Cleanup and Abatement Order No. 87-161. We have no information concerning other conditions that would adversely impact the value or usage of these properties. However, additional assessment or remediation may be needed depending on future use of these sites.

The jurisdictional requirements of other agencies, such as the U.S. Environmental Protection Agency, are not affected by this Board's "no further requirements" decision. Such agencies may choose to make their own determinations regarding the site.

We are pleased to release these two parcels from the obligations of the cleanup and abatement order. Your cooperation in completing the required work is appreciated. If you have any questions, please contact Alex Carlos at (213) 266-7583.

Ron N. Helgerson
Lockheed Martin Corporation
Burbank Program Office
2550 North Hollywood Way, Suite 305
Burbank, CA 91505-1055No Further Requirements, Parcel B, Lockheed Plant B-6 West
(File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed the July 26, 1996, letter requesting closure for Parcel B of Plant B-6 as notated on the map that accompanied the letter. Upon review of the subject proposal and other information in our files, we have the following comments with respect to the Well Investigation Program:

1. During multiple phases of assessment, a total of 193 soil matrix samples were collected from 20 boreholes in this parcel. Laboratory analysis of these samples detected maximum concentrations of 6,820 mg/kg TRPH at 2' bgs, 23 ug/kg acetone, 6 ug/kg TCE, 22 ug/kg 4-methyl-2-pentanone, 3.2 mg/kg bis(2-ethylhexyl)phthalate at 10' bgs, 580 ug/kg pyrene, 480 chrysene and 400 ug/kg benzoanthracene, 98 ug/kg aroclor-1254 (PCBs) at 2' bgs. Supplemental sampling demonstrated that the soil contamination is limited to small areas and shallow depths. Ground water is at approximately 200' bgs in this area.
3. A total of 126 soil gas samples were collected on the subject parcel to a maximum depth of 60' bgs. Only minor concentrations of PCE (maximum 3 ug/L), TCE (maximum 69 ug/L), carbon tetrachloride (maximum 14 ug/L), DCE (maximum 7 ug/L) and freon-113 (maximum 9 ug/L) were detected in these samples.

Based on our inspections and information submitted, we have no further requirements with respect to the Well Investigation Program for the subject parcel. The soil contamination detected in this parcel is not a threat to ground water quality and therefore cleanup is not necessary. This "no further requirements" determination for this parcel does not affect requirements for assessment and cleanup on the other adjacent parcels covered by our Cleanup and Abatement Order No. 87-161. We have no information concerning other conditions that would adversely impact the value or usage of this property. However, additional assessment or remediation may be needed depending on future use of this site.

No Further Requirements, Parcel G, Lockheed Plant B-6 West
(File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed the July 26, 1996, letter requesting closure for Parcel G of Plant B-6 as notated on the map that accompanied the letter. Upon review of the subject proposal and other information in our files, we have the following comments with respect to the Well Investigation Program.

During multiple phases of assessment, a total of 242 soil matrix samples were collected and analyzed from 26 boreholes on this parcel. Laboratory analysis of these samples detected maximum concentrations of 1,081 mg/kg TRPH at 2' bgs, 28 ug/kg acetone, 82 ug/kg methylene chloride, 12 ug/kg naphthalene, 6 ug/kg 1,2,4-trimethylbenzene, and 4.4 mg/kg of bis(2-ethylhexyl)phthalate at 10' bgs. Supplemental sampling demonstrated that the extent of soil contamination is limited to small areas and shallow depths. Laboratory analysis of a total of 96 shallow (5' bgs) soil vapor samples detected only low concentrations of PCE (maximum 3.1 ug/L), TCE (maximum 1.3 ug/L) and 1,1,1-TCA (maximum 2.2 ug/L). Ground water is at approximately 220' bgs in this area.

Based on our inspections and information submitted, we have no further requirements with respect to the Well Investigation Program for the subject parcel. The soil contamination detected on this parcel is not a threat to ground water quality and therefore cleanup is not necessary. This "no further requirements" determination for this parcel does not affect requirements for assessment and cleanup on the other adjacent parcels covered by our Cleanup and Abatement Order No. 87-161. We have no information concerning other conditions that would adversely impact the value or usage of this property. However, additional assessment or remediation may be needed depending on future use of this site.

The jurisdictional requirements of other agencies, such as the U.S. Environmental Protection Agency, are not affected by this Board's "no further requirements" decision. Such agencies may choose to make their own determinations regarding the site.

No Further Requirements, Parcel C, Lockheed Plant B-6 West
 (File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed your July 26, 1996, letter requesting closure for Parcel C of Plant B-6 as notated on the map that accompanied the letter. Upon review of the subject proposal and other information in our files, we have the following comments with respect to the Well Investigation Program:

1. During multiple phases of assessment at the subject site, a total of 65 soil matrix samples were collected on this parcel. Laboratory analysis of these samples detected maximum concentrations of 6600 mg/kg TRPH at 15' bgs and 4100 mg/kg TPH-diesel at 2' bgs [near a former diesel/fuel oil UST (F32)], 120 ug/kg acetone, 12 ug/kg MEK, 340 ug/kg bis(2-ethylhexyl)phthalate, 350 ug/kg di-n-butylphthalate, 420 ug/kg anthracene, 5100 ug/kg pyrene, 1300 ug/kg benzopyrene, 4000 ug/kg benzoanthracene, 3200 ug/kg benzopyrene, 5000 ug/kg benzofluoranthene, 1300 ug/kg indenopyrene, 4600 ug/kg chrysene, 510 ug/kg dibenzanthracene, 4700 ug/kg fluoranthene, 1300 ug/kg phenanthrene and 49 ug/kg aroclar-1254. Supplemental sampling demonstrated that the identified soil contaminated is limited to relatively small areas and shallow depths. Ground water is at approximately 200' bgs in this area.
2. Additionally, a total of 21 shallow (6' bgs) soil gas samples were collected on the subject parcel. Only low concentrations of TCE (maximum 11 ug/L) were detected in these samples.

Based on our inspections and information submitted, we have no further requirements with respect to the Well Investigation Program for the subject parcel. The soil contamination detected on this parcel is not a threat to ground water quality and therefore cleanup is not necessary. This "no further requirements" determination for this parcel does not affect requirements for assessment and cleanup on the other adjacent parcels covered by our Cleanup and Abatement Order No. 87-161. We have no information concerning other conditions that would adversely impact the value

No Further Requirements, Parcel L, Lockheed Plant B-6 West
(File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed your July 10, 1996, letter requesting closure for Parcel L of Plant B-6 as notated on the map that accompanied the letter. Upon review of the subject proposal and other information in our files, we have the following comments with respect to the Well Investigation Program:

1. During multiple phases of assessment on the subject parcel, a total of 11 soil matrix samples were collected and analyzed. Laboratory analysis of these samples detected maximum concentrations of 350 mg/kg TRPH (2' bgs), 45 ug/kg acetone, 10 ug/kg ethylbenzene, 13 ug/kg toluene and 46 ug/kg xylenes. Supplemental sampling demonstrated that the identified soil contamination is limited to shallow depths. Ground water is approximately 210' bgs in this area.
2. Only one shallow (6' bgs) soil gas sample was collected on this subject parcel. Relatively low concentrations of 1,1-DCE (maximum 1.9 ug/l) were detected in the sample.

Based on our inspections and information submitted, we have no further requirements with respect to the Well Investigation Program for the subject parcel. The soil contamination detected on this parcel is not a continuing threat to ground water quality and therefore cleanup is not necessary. This "no further requirements" determination for this parcel does not affect requirements for assessment and cleanup on the other adjacent parcels covered by our Cleanup and Abatement Order No. 87-161. We have no information concerning other conditions that would adversely impact the value or usage of this property. However, additional assessment or remediation may be needed depending on future use of this site.

The jurisdictional requirements of other agencies, such as the U.S. Environmental Protection Agency, are not affected by this Board's "no further requirements" decision. Such agencies may choose to make their own determinations regarding the site.

No Further Requirements, Parcel I, Lockheed Plant B-6 West.....
(File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed your July 26, 1996, letter requesting closure for Parcel I of Plant B-6 as notated on the map that accompanied the letter. Upon review of the subject proposal and other information in our files, we have the following comments with respect to the Well Investigation Program:

1. During initial assessment on this parcel, a total of 13 soil matrix samples were collected and analyzed. Laboratory analysis of these samples detected maximum concentrations of 4,881 mg/kg TRPH (2' bgs) and 11 ug/kg acetone. Supplemental sampling demonstrated that the TPH soil contamination is limited to small areas and shallow depths. Ground water is at approximately 210' bgs in this area.
2. Assessment on the subject parcel also included a total of 17 soil gas samples collected to a maximum depth of 60' bgs. Only relatively minor concentrations of 1,1,1-TCA (maximum 37 ug/L), 1,1-DCE (maximum 99 ug/L) and freon-113 (maximum 46 ug/L) were detected in these samples.

Based on our inspections and information submitted, we have no further requirements with respect to the Well Investigation Program for the subject parcel. Remaining soil contamination detected on this parcel is not a threat to ground water quality and therefore cleanup is not necessary. This "no further requirements" determination for this parcel does not affect requirements for assessment and cleanup on other adjacent parcels covered by our Cleanup and Abatement Order No. 87-161. We have no information concerning other conditions that would adversely impact the value or usage of this property. However, additional assessment or remediation may be needed depending on future use of this site.

The jurisdictional requirements of other agencies, such as the U.S. Environmental Protection Agency, are not affected by this Board's "no further requirements" decision. Such agencies may choose to make their own determinations regarding the site.

No Further Requirements, Parcels B, C, I and L, Lockheed Plant B-6
West (File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

Recently, we issued no further requirements with respect to the
Well Investigation Program for the subject parcels. The soil
contamination detected in these parcels is not a threat to ground
water quality and therefore cleanup is not necessary. As a result,
the subject parcels are excluded from requirements set forth in
Cleanup and Abatement Order No. 87-161. This "no further
requirements" determination for these parcels does not affect
requirements for assessment and cleanup on the other adjacent
parcels covered by our Cleanup and Abatement Order No. 87-161.

If you have any questions, please contact Alex Carlos at (213) 266-
7583.

No Further Requirements, Parking Lot Northeast of Building 82, Lockheed Plant B-6 (File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have received (September 18, 1996) the report "Geophysical Survey, Parking Lot Northeast of Lockheed Building 82" dated 1996, prepared by your consultant, Tetra Tech, Inc. The report presents results of a geophysical survey and exploratory trenching conducted to identify subsurface anomalies which may be associated with VOCs previously detected in the subject area.

Although the geophysical survey detected anomalies, subsequent trenching in two anomalous areas did not detect subterranean structures or debris. Based on the information submitted and other information contained in our files, no further investigation related to the subject area is required with respect to the Well Investigation Program. As noted in our August 8, 1995, letter, soil vapor data from this area demonstrated low VOC concentrations and therefore no further soil gas investigation is needed.

The jurisdictional requirements of other agencies, such as the U.S. Environmental Protection Agency, are not affected by this Board's "no further requirements" decision. Such agencies may choose to make their own determinations regarding the site. If you have any questions, please contact Alex Carlos at (213) 266-7583.

No Further Requirements, Area #3, Subsurface Soil Investigation, Building 353 - Dry Wells and Reservoir Sump, Lockheed Plant B-6 (File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed the "Area #3 Subsurface Soil Investigation, Building 353 - Dry Wells and Reservoir Sump" report dated September 27, 1996, prepared by your consultant, Tetra Tech Inc. This report documents results of soil assessment intended to determine the extent of petroleum hydrocarbon impact beneath the subject area. Upon review, we have the following comments with respect to the Well Investigation Program:

1. During the subject phase of assessment, a total of 48 soil samples were collected from 3 boreholes drilled to a maximum depth of 90' bgs in the subject area.
2. Maximum concentrations of TRPH (total recoverable petroleum hydrocarbons) and TEH (total extractable hydrocarbons) were detected at 10' bgs at concentrations of 210 mg/kg and 270 mg/kg, respectively. TRPH and TEH concentrations were either non-detectable or less than 21 mg/kg at depths greater than 10' bgs. Previous assessment detected maximum concentrations of 709 mg/kg TRPH at 10' bgs adjacent at the reservoir sump and up to 255 mg/kg TRPH at 60' bgs in the vicinity of the dry wells.
3. The subject report and previous assessment demonstrate that petroleum-hydrocarbon impacted soil is limited to areas adjacent to the former dry wells and reservoir sump. Ground water is at approximately 260' bgs in this area.

Based on the subject submittal and other information in our files, we have no further requirements with respect to the Well Investigation Program. Soil contamination detected in this area is not a threat to ground water quality and therefore cleanup is not necessary.

No Further Requirements, Area #7, Subsurface Soil Investigation,
Building 88 - Former Fuel UST, Lockheed Plant B-6
(File No. 104.0574) (Cleanup & Abatement Order No. 87-161)

We have reviewed the "Area #7 Subsurface Soil Investigation, Building 88 - Former Fuel UST" report dated September 27, 1996, prepared by your consultant, Tetra Tech Inc. This report documents results of soil assessment of petroleum hydrocarbon impact at the former 5,000 gallon UST located north of Building 88 within Plant B-6. Upon review, we have the following comments with respect to the Well Investigation Program:

1. During the subject phase of assessment, a total of 61 soil samples were collected from 4 boreholes drilled to a maximum depth of 140' bgs in the subject UST area.
2. Maximum concentrations of TRPH (total recoverable petroleum hydrocarbons) and TEH (total extractable hydrocarbons) were detected in shallow soil matrix samples at concentrations of 980 mg/kg and 480 mg/kg, respectively. TRPH and TEH concentrations were either non-detectable or less than 130 mg/kg at depths greater than 10' bgs. Previous assessment detected lower concentrations in the subject UST area.
3. Ground water is at approximately 260' bgs in this area.

Based on the subject submittal and other information in our files, we have no further requirements with respect to the Well Investigation Program. Soil contamination detected in this area is not a threat to ground water quality and therefore cleanup is not warranted.

The jurisdictional requirements of other agencies, such as the U.S. Environmental Protection Agency, are not affected by this Board's "no further requirements" decision. Such agencies may choose to make their own determinations regarding the site.

No Further Requirements - Area #8, Subsurface Soil Investigation, Building 88-Former UST F28, Lockheed Plant B-6 (File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed the "Area #8 Subsurface Soil Investigation, Building 88-Former UST F28" report dated October 4, 1996, prepared by your consultant, Tetra Tech Inc. This report documents results of soil assessment to determine petroleum hydrocarbon impact in the area of former jet fuel underground storage tank (UST) F28 located south of Building 88 in the northeast part of Plant B-6. Upon review, we have the following comments with respect to the Well Investigation Program:

1. During the subject phase of assessment, a total of 91 soil samples were collected from 6 boreholes drilled to a maximum depth of 153' bgs in the subject UST area.
2. The highest concentrations of TRPH (total recoverable petroleum hydrocarbons) and TEH (total extractable hydrocarbons) characterized as diesel were detected in soil matrix samples from the 15' to 35' bgs depth interval at 2,100 to 8,100 mg/kg and 1,100 to 5,800 mg/kg, respectively. TRPH and TEH concentrations were either non-detectable or less than 380 mg/kg in deeper samples analyzed. Previous assessment detected lower TPH and TEH concentrations in the subject UST area.
3. Ground water is at approximately 260' bgs in this area.

Based on the subject submittal and other information in our files, we have no further requirements with respect to the Well Investigation Program. Soil contamination detected in this area is not a threat to ground water quality and therefore cleanup is not necessary.

The jurisdictional requirements of other agencies, such as the U.S. Environmental Protection Agency, are not affected by this Board's "no further requirements" decision. Such agencies may choose to make their own determinations regarding the site.

Building 353 - Process Lines, Lockheed Plant B-6
(File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed the "Plant B-6: Area #4 Subsurface Soil Investigation, Building 353 - Process Lines" report dated September 12, 1996, prepared by your consultant, Tetra Tech Inc. This report documents results of soil assessment to determine metals impact in the process line area located within Building 353 at the Plant B-6 site. Upon review, we have the following comments with respect to the Well Investigation Program:

1. During the subject phase of assessment, a total of 72 soil matrix samples were collected from 8 boreholes drilled to a maximum depth of 50' bgs in the subject area.
2. The concentrations of metals detected in soil matrix samples were below TLC and less than 10 times the STLC concentrations. The highest concentration of lead was 16 mg/kg collected at 10' bgs. Lead was previously detected at 358 mg/kg, which is above 10 times the STLC (50 mg/kg), in a sample collected at 2' bgs in the subject area.
3. Ground water is at approximately 260' bgs in this area.

Based on the subject submittal and other information in our files, we have no further requirements with respect to the Well Investigation Program. Soil contamination detected in this area is not a threat to ground water quality and therefore cleanup is not necessary.

The jurisdictional requirements of other agencies, such as the U.S. Environmental Protection Agency, are not affected by this Board's "no further requirements" decision. Such agencies may choose to make their own determinations regarding the site.

Burbank, California 91505-0256No Further Requirements, Area #11, Subsurface Soil Investigation, Building 310 - Former Closed In-Place UST F15, Lockheed Plant B-6 (File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed the "Plant B-6: Area #11 Subsurface Soil Investigation, Building 310 - Former Closed In-Place UST F15" report dated October 11, 1996, prepared by your consultant, Tetra Tech Inc. This report presents results of assessment of petroleum hydrocarbon impact beneath the former 3,000 gallon diesel underground storage tank (F15) located outside the southwest corner of Building 310 within Plant B-6. Upon review, we have the following comments with respect to the Well Investigation Program:

1. During the subject phase of assessment, a total of 55 soil samples were collected from 4 boreholes drilled to a maximum depth of 147' bgs in the subject UST area.
2. TRPH (total recoverable petroleum hydrocarbons) and TEH (total extractable hydrocarbons) were detected at maximum concentrations of 160 mg/kg (42.5' bgs) and 220 mg/kg (147.5' bgs), respectively. TRPH and TEH concentrations were either non-detectable or less than 69 mg/kg in all the remaining samples analyzed. Previous assessments detected a maximum of 570 mg/kg (2' below the base of the tank) TEH compounds in the diesel range and lower TRPH concentrations in the subject UST area. No VOC, SVOC, PCB or metal compounds were detected in samples collected in the subject area.
3. Ground water is at approximately 260' bgs in this area.

Based on the subject submittal and other information in our files, we have no further requirements with respect to the Well Investigation Program. Soil contamination detected in this area is not a threat to ground water quality and therefore cleanup is not warranted.

The jurisdictional requirements of other agencies, such as the U.S. Environmental Protection Agency, are not affected by this Board's "no further requirements" decision. Such agencies may choose to make their own determinations regarding the site.

No Further Requirements, Area #10, Subsurface Soil Investigation, Building 310 - Former Closed In-Place UST F20, Lockheed Plant B-6 (File No. 104.0674) (Cleanup & Abatement Order No. 87-151)

We have reviewed the "Plant B-6: Area #10 Subsurface Soil Investigation, Building 310 - Former Closed In-Place UST F20" report dated October 11, 1996, prepared by your consultant, Tetra Tech Inc. This report presents results of assessment of petroleum hydrocarbon impact beneath the former 3,000 gallon diesel underground storage tank (F20) located outside the northeast corner of Building 310 within Plant B-6. Upon review, we have the following comments with respect to the Well Investigation Program:

1. During the subject phase of assessment, a total of 58 soil samples were collected from 4 boreholes drilled to a maximum depth of 150' bgs in the subject UST area. UST F20 was closed in-place in 1989 and removed in July 1996.
2. TRPH (total recoverable petroleum hydrocarbons) and TEH (total extractable hydrocarbons) were detected at maximum concentrations of 320 mg/kg (5' bgs) and 21 mg/kg (40' bgs), respectively. Lower concentrations were in samples collected during previous phases of assessment. No VOC, SVOC or PCB compounds were detected in the samples.
3. Ground water is at approximately 260' bgs in this area.

Based on the subject submittal and other information in our files, we have no further requirements with respect to the Well Investigation Program. Soil contamination detected in this area is not a threat to ground water quality and therefore cleanup is not warranted.

The jurisdictional requirements of other agencies, such as the U.S. Environmental Protection Agency, are not affected by this Board's "no further requirements" decision. Such agencies may choose to make their own determinations regarding the site.

Building 304 - Former UST F25, Lockheed Plant B-6
(File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed the "Plant B-6: Area #13 Subsurface Soil Investigation, Building 304 - Former UST F25" report dated October 25, 1996, prepared by your consultant, Tetra Tech Inc. This report presents results of assessment of petroleum hydrocarbon impact beneath the former 1,750 gallon diesel underground storage tank (UST) F25 (removed in 1989) located southwest of Building 304 within Lockheed Plant B-6. Upon review, we have the following comments with respect to the Well Investigation Program:

1. During the subject phase of assessment, a total of 110 soil samples were collected from 5 boreholes drilled to a maximum depth of 200' bgs in the subject UST area.
2. TRPH (total recoverable petroleum hydrocarbons) and TEH (total extractable hydrocarbons) characterized as diesel and motor oil were detected at maximum concentrations of 81 mg/kg (at 90' bgs) and 34 mg/kg (at 130' bgs), respectively. TRPH and TEH concentrations were either non-detectable or less than 50 mg/kg in all the other samples analyzed. Previous assessment detected maxima of 5,400 mg/kg TRPH (at 45' bgs) and 5,000 mg/kg (at 45' bgs) petroleum hydrocarbons in the diesel range in the subject UST area. No other contaminants were detected above trace levels in samples from the subject area.
3. Ground water is at approximately 210' bgs in this area.

Based on the subject submittal and other information in our files, we have no further requirements with respect to the Well Investigation Program. Soil contamination detected in this area is not a threat to ground water quality and therefore cleanup is not warranted.

2550 North Hollywood Way, Suite 305
Burbank, California 91505-0256No Further Requirements, Clarifiers B-6-F, B-6-K and B-6-Z, Lockheed Plant B-6 (File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed the "Closure Report Clarifiers B-6-F, B-6-K and B-6-Z, Lockheed Plant B-6" dated October 29, 1996, prepared by your consultant, Tetra Tech Inc. This report documents removal of the subject clarifiers located at Buildings 360, 353 and 345 within Lockheed Plant B-6. Upon review, we have the following comments with respect to the Well Investigation Program:

1. During this removal action, a total of 6 soil samples (two from each clarifier) were collected from the three clarifier excavations and analyzed for the chemicals contained in the clarifier waste water.
2. No metal concentrations were reported above the Title 22 TTLC or 10 times the STLC. Maximum concentrations of TRPH (total recoverable petroleum hydrocarbons) and TEM (total extractable hydrocarbons) in the diesel range were 180 mg/kg and 28 mg/kg, respectively. No discoloration, odor or other evidence of waste discharges were reported based on visual inspection of the excavations.
3. Ground water is approximately 260' bgs in this area.

Based on the subject submittal and other information in our files, we have no further requirements with respect to the Well Investigation Program. Soil contamination detected in the subject areas is not a threat to ground water quality and therefore cleanup is not warranted.

The jurisdictional requirements of other agencies, such as the U.S. Environmental Protection Agency, are not affected by this Board's "no further requirements" decision. Such agencies may choose to make their own determinations regarding the site.

November 19, 1996

Ron N. Helgerson
Lockheed Martin Corporation
2550 North Hollywood Way, Suite 305
Burbank, California 91505-0256No Further Requirements, Former UST F14, Building 309, Lockheed Plant B-6 (File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed the "Plant B-6: Supplemental Subsurface Soil Investigation, Building 309 - Former UST F14" report dated November 6, 1996, prepared by your consultant, Tetra Tech Inc. This report presents results of supplemental assessment of petroleum hydrocarbon impact beneath the former 3,000 gallon diesel underground storage tank F14 located near the northeast corner of Building 309 in Plant B-6. Upon review, we have the following comments with respect to the Well Investigation Program:

1. During the subject phase of assessment, a total of 19 soil samples were collected from 2 boreholes drilled to a maximum depth of 60' bgs in the subject UST area.
2. Total recoverable petroleum hydrocarbons (TRPH) and total extractable hydrocarbons (TEH) characterized as diesel were detected at maximum concentrations of 3,520 mg/kg (10' bgs) and 4,360 mg/kg (10' bgs), respectively. TRPH and TEH concentrations were either non-detectable or less than 32 mg/kg in all the remaining samples analyzed. Previous assessments detected a maximum of 7,200 mg/kg TEH compounds in the diesel range (2' below the base of the tank) in the subject UST area. No aromatic volatile organic compounds were detected in samples collected in the subject area.
3. Ground water is at approximately 200' bgs in this area.

Based on the subject submittal and other information in our files, we have no further requirements with respect to the Well Investigation Program. Petroleum hydrocarbons detected in soil in this area is not a threat to ground water quality and therefore cleanup is not warranted.

The jurisdictional requirements of other agencies, such as the U.S. Environmental Protection Agency, are not affected by this Board's "no further requirements" decision. Such agencies may choose to make their own determinations regarding the site.

No Further Requirements, Area #5 - Building 353 - Former TCA Degreaser, Lockheed Plant B-6 (File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed Lockheed Martin's "Area #5 Subsurface Soil Investigation, Building 353 - Former TCA Degreaser" report dated October 25, 1996, prepared by your consultant, Tetra Tech Inc. This report documents the results of supplementary soil and soil gas investigations in the former TCA degreaser area located in former Building 353 within Lockheed Plant B-6. Upon review, we have the following comments with respect to the Well Investigation Program:

1. Prior to drilling and sampling, the 1,1,1-TCA degreaser containment pit and a previously undiscovered concrete pit below it were removed and the area excavated to a depth of 15' bgs.
2. Laboratory analysis of 46 soil matrix samples collected in the subject area to a maximum depth of 200' bgs detected only low concentrations (<48 ug/kg) of VOCs, primarily 1,1,1-TCA, and a maximum of 140 mg/kg TRPH (at 90' bgs). A tentatively identified compound (1,4-dioxane) was detected in samples taken from 20' to 50' bgs at concentrations between 0.04 and 3.3 mg/kg.
3. Laboratory analysis of 36 soil vapor samples from the subject site detected 1,1,1-TCA at concentrations ranging from 69 to 448 ug/L at depths of 30' to 60' bgs, and lesser concentrations of other contaminants. 1,1,1-TCA concentrations in soil vapor samples collected at depths from 60' to 200' bgs did not exceed 86 ug/L. Other VOCs were also detected in some samples at concentrations below 291 ug/L.
4. Previous investigations in this area detected TRPH to a depth of 10' bgs at a maximum concentration of 92 mg/kg (at 2' bgs). Ten tentatively identified VOCs were detected in soil matrix samples from 15' to 55' bgs at concentrations from 7 to 400 ug/kg.

p:\lockheed\8-6west\areas.Als

104-01-47981

LEGIBILITY TEST: For quality of original documents being filmed.

LWL2 002280

Ron N. Helgerson
Lockheed Martin Corporation
Page 2

5. Multi-depth soil gas samples collected to a maximum depth of 61' bgs during previous investigations in this area contained 1,1,1-TCA at maximum concentration of 739 ug/L (at 6' bgs). Low concentrations (<107 ug/L) of 1,1-DCE, TCE, PCE and freon-113 were also detected.
6. Ground water is approximately 260' bgs in this area.

Based on the subject submittal and other information in our files, we have no further requirements with respect to the Well Investigation Program. Residual soil contamination detected in this area is not a threat to ground water quality and therefore additional cleanup is not warranted.

The jurisdictional requirements of other agencies, such as the U.S. Environmental Protection Agency, are not affected by this Board's "no further requirements" decision. Such agencies may choose to make their own determinations regarding the site.

If you have any questions, please contact Alex Carlos at (213) 266-7583.

No Further Requirements, Parcel E, Lockheed Plant B-6 West
(File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed your November 8, 1996, letter requesting closure for Parcel E at Plant B-6 as notated on the map that accompanied the letter. Upon review of the subject proposal and other information in our files, we have the following comments with respect to the Well Investigation Program:

- 1. During multiple phases of assessment, approximately 694 soil matrix and 190 soil gas samples were collected at the subject parcel. Based on the results of these investigations, six areas that required further assessment were identified:

- Building 345-346
- Building 357 utility pit (Sites 3)
- Building 357 utility pit/trenches (Site 4)
- Building 370 sump/sand trap (Area #1)
- Building 363 Former Jet Fuel UST B6-F33 (Area #2)
- LAT Fuel Farm UST F37

- 2. Additional soil gas investigation in the Building 345-346 area demonstrated that the relatively low VOC concentrations (<166 ug/L) were limited to depths less than 20' bgs. Based on these results, Board required no further investigation in this area on August 6, 1995.

- 3. At Sites 3 and 4, further soil assessments were conducted to determine the extent of petroleum hydrocarbon and metal impact. Investigation results demonstrated that the identified soil contamination is limited to relatively small areas and shallow depths. Concentrations of metals detected in confirmation samples were below Title 22 TTLC and 10 times STLC and U.S. Environmental Protection Agency (USEPA) Preliminary Remediation Goals (1995). Based on results of limited excavation delineation in the subject sites, the Board approved backfilling in July 1996.

4. Additional subsurface investigation was conducted in Area #1 to delineate the extent of VOC impact. A remedial action was required and approximately 590 cubic yards of petroleum hydrocarbon and VOC contaminated soil were excavated to a depth of approximately 35' bgs in this area. On November 5, 1996, the Board issued a "no further requirements" letter for this area based on the results of this remediation.
5. Based on site assessment results for Building 363 Former Jet Fuel UST B6-F33 (Area #2), Board staff issued a "no further requirements" letter on September 23, 1996. Multiple investigations demonstrated that petroleum hydrocarbon contamination in this area is limited to the immediate area of the former tank cavity and vertically to approximately 120' bgs.
6. On October 30, 1996, Board staff issued a "no further requirements" letter for UST F37 based on the limited area and depth (approximately 90' bgs) of soil contamination, and depth to groundwater (approximately 260' bgs) in this area.

Based on our inspections and information submitted, we have no further requirements with respect to the Well Investigation Program for the subject parcel. Remaining soil contamination in this parcel is not a threat to ground water quality and therefore further cleanup is not warranted. This parcel is therefore excluded from requirements in our Cleanup and Abatement Order No. 87-161.

November 26, 1996

Ron N. Halgerson
Lockheed Martin Corporation
2550 North Hollywood Way, Suite 305
Burbank, California 91505-0256No Further Requirements, Area #6, Building 352 - Former Sewage Sump, Lockheed Plant B-6 (File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed the "Area #6 - Building 352, Former Sewage Sump Report of Results" dated November 21, 1996, prepared by your consultant, Tetra Tech Inc. The report summarizes the results of the remedial excavation for the removal of soil containing polychlorinated biphenyl compounds (PCBs) previously detected at soil boreholes C352-SB73 and C352-SB77 in the subject area. Upon review, we have the following comments with respect to the Well Investigation Program:

1. During this remedial action, approximately 1,000 cubic yards of soil impacted with PCBs exceeding the USEPA Preliminary Remediation Goals (340 ug/kg for PCB) were excavated to a depth of approximately 44' bgs in the subject area. A total of 7 confirmation soil samples from the excavation were collected and analyzed for PCBs, TRPH and extractable hydrocarbons (TEH). The excavated soils were reportedly transported off-site to an approved treatment and disposal facility.
2. PCB (Arocolor-1248) was detected in two confirmation samples at a maximum concentration of 240 ug/kg. No TRPH and TEH were detected in the confirmation samples.
3. Previous investigations in this area detected PCB at concentrations ranging from non-detectable to 1,001 mg/kg in the 5' to 35' bgs depth interval. Concentrations of PCB compounds collected at depths below 35' bgs were either non-detectable or less than 540 ug/kg. Other contaminants previously detected included TRPH (maximum 1,100 mg/kg at 60' bgs) and relatively low concentrations of VOCs (maximum 160 ug/kg PCE at 15'). TRPH concentrations were generally less than 100 mg/kg.
4. Ground water is approximately 260' bgs in this area.

Based on the subject submittal and other information in our files, we have no further requirements with respect to the Well Investigation Program. Residual soil contamination detected in this area is not a threat to ground water quality and therefore additional cleanup is not warranted.

The jurisdictional requirements of other agencies, such as the U.S. Environmental Protection Agency, are not affected by this Board's "no further requirements" decision. Such agencies may choose to make their own determinations regarding the site.

If you have any questions, please contact Alex Carlos at (213) 266-7583.

December 3, 1996

Ron N. Helgeson
Lockheed Martin Corporation
Burbank Program Office
2550 North Hollywood Way, Suite 305
Burbank, CA 91505-1055No Further Requirements, Parcel A, Lockheed Plant B-6 West
(File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed your November 8, 1996, letter requesting closure for Parcel A at Plant B-6 as notated on the map that accompanied the letter. Upon review of the subject proposal and other information in our files, we have the following comments with respect to the Well Investigation Program:

1. During multiple phases of assessment, approximately 663 soil matrix and 140 soil gas samples were collected at the subject parcel. Based on the results of these investigations, nine areas that required further assessment were identified:

Building 309/310
Building 322 southeast corner (Site 19)
Southeast Parking Lot #7 (Site 20)
Building 310 former UST F17 (Site 21)
Building 309 former UST F9/F17 (Site 22)
Building 310 former closed in-place UST F20 (Area #10)
Building 310 former closed in-place UST F15 (Area #11)
Building 304 sump/sand trap (Area #12)
Building 304 former UST F14

2. Additional soil gas investigation within Building 309/310 demonstrated that the relatively low VOC concentrations (<31 ug/L) were limited primarily to depths less than 20' bgs. Based on these results, Board staff required no further investigation in this area on August 8, 1995.
3. At Sites 19, 20, 21 and 22, further soil assessment was conducted to determine the extent of petroleum hydrocarbon and metal impact. Investigation results demonstrated that soil contamination is limited to relatively small areas and shallow depths (<25' bgs). Based on confirmation sampling results obtained during the limited excavation delineation in the subject sites, the Board approved backfilling in July 1996.

JDR 10 7 6 1

LEGIBILITY TEST: For quality of original documents being filmed.

LWL2 002273

4. Additional subsurface investigation was conducted in Area #10 to delineate the extent of petroleum hydrocarbon impact beneath the former 3,000 gallon diesel UST F20. Petroleum hydrocarbon concentrations detected were less than 320 mg/kg and limited to shallow depths (less than 40' bgs). On October 28, 1996, Board staff issued a "no further requirements" letter for this area.
5. Based on supplementary assessment at Area #11 (former diesel UST F15), we issued a "no further requirements" letter on October 24, 1996. Petroleum hydrocarbons were detected at maximum concentration of 570 mg/kg 2' below the base of the tank in the subject UST area.
6. Supplementary assessment was conducted in Area #12 to determine the extent of VOC impact. No VOCs and less than 310 mg/kg of petroleum hydrocarbons were detected during the investigation. On May 9, 1996, Board staff made a "no further assessment" determination for this area.
7. On November 19, 1996, Board staff issued a "no further requirements" letter for UST F14 based on the limited area and depth (approximately 90' bgs) of soil contamination, relatively low concentrations of petroleum hydrocarbons and depth to groundwater (approximately 210' bgs). Supplemental assessment in this area detected TRPH and TEH (characterized as diesel) at maximum concentrations of 3,520 mg/kg (10' bgs) and 4,360 mg/kg (10' bgs), respectively. No aromatic VOCs were detected in the subject area.

Based on our inspections and information submitted, we have no further requirements with respect to the Well Investigation Program for the subject parcel. Remaining soil contamination in this parcel is not a threat to ground water quality and therefore further cleanup is not warranted. This parcel is therefore excluded from requirements in our Cleanup and Abatement Order No. 87-161.

No Further Requirements, Parcel J, Lockheed Plant B-6 West
(File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed your letter dated November 25, 1996, requesting closure for Parcel J at Plant B-6 as notated on the map that accompanied the letter. Upon review of the subject proposal and other information in our files, we have the following comments with respect to the Well Investigation Program:

1. During multiple phases of assessment, approximately 884 soil matrix and 403 soil gas samples were collected at the subject parcel. Based on the results of these investigations, fourteen areas that required further assessment were identified:

- Site No. 5 - Building 84 clarifier
- Site No. 7 - Building 88 - sump and pump lift station
- Site No. 9 - Building 88 - collection sump
- Site No. 10 - Building 352 machine pit #1
- Site No. 11 - Building 82 sand pit
- Site No. 12 - Building 352 machine pit #2
- Site No. 14 - Building 82 - former film tank
- Site No. 15 - Building 82 - northeast parking lot
- Area No. 4 - Building 353 - process line
- Area No. 5 - Building 353 - former TCA degreaser
- Area No. 6 - Building 352 - former sewage sump
- Area No. 7 - Building 88 - former fuel UST
- Area No. 8 - Building 88 - former UST F28
- Area No. 9 - Building 82 - northern parking lot

2. At Sites 5, 7, 9, 10, 11, 12, 14 and 15, further soil assessment was conducted to determine the extent of petroleum hydrocarbon, VOC, PCB and metal impact. Investigation results demonstrated that soil contamination is limited to relatively small areas and shallow depths (<25' bgs). Based on confirmation sampling results, Board staff approved backfilling in July 1996.

Lockheed Martin Corporation
Page 2

3. Additional subsurface investigation was conducted in Area #4 to delineate the extent of metals impact in the process line within Building 353. Metal concentrations detected in soil samples were below Title 22 TTLC and less than 10 times STLC concentrations and U.S. Environmental Protection Agency (USEPA) Preliminary Remediation Goals (1995). The highest concentration of lead was 16 mg/kg (at 10' bgs). On October 15, 1996, Board staff issued a "no further requirements" letter for this area.
4. Based on supplementary assessment at Area #5 (Building 353 - former TCA degreaser), we issued a "no further requirements" letter on November 20, 1996. 1,1,1-TCA was the primary VOC detected at maximum concentrations of 48 ug/kg (soil matrix) at 15' bgs and 448 ug/L (soil gas) at 30' bgs. The 1,1,1-TCA degreaser containment pit was removed and the area excavated to a depth of 15' bgs.
5. In Area #6, approximately 1,000 cubic yards of soil containing PCBs exceeding the USEPA Preliminary Remediation Goals (340 ug/kg for PCB) were excavated to a depth of approximately 44' bgs. PCB (Arocolor-1248) was detected in two confirmation samples at a maximum concentration of 240 ug/kg. On November 26, 1996, Board staff made a "no further remediation" determination for this area.
6. On October 7 and 10, 1996, Board staff issued "no further requirements" letters for Area #7 and Area #8, respectively. Maximum concentrations of total recoverable petroleum hydrocarbons (TRPH) and total extractable hydrocarbons (TEH) were detected in shallow soils (<10' bgs) in Area #7 at concentrations of 980 mg/kg and 480 mg/kg, respectively. In Area #8, the highest concentrations of TRPH and TEH characterized as diesel were detected in soil samples between 15' and 35' bgs at 2,100 to 8,100 mg/kg and 1,100 to 5,800 mg/kg, respectively.
7. In Area #9, supplementary assessment was conducted to delineate the extent of VOCs. No VOCs were positively detected while maximum TRPH concentration was 310 mg/kg (5' and 10' bgs). Board staff made a "no further requirements" determination for this area on May 9, 1996.

Completion of assessment and cleanup in Parcel J fulfills requirements for closure of Plant B-6. Based on our inspections and information submitted, we have no further requirements with respect to the Well Investigation Program for Parcel J and the entire Plant B-6 facility. Residual soil contamination in this

parcel is not a threat to ground water quality, human health and the environment and therefore further cleanup is not warranted. This parcel and Plant B-6 are therefore excluded from requirements in our Cleanup and Abatement Order No. 87-161.

The jurisdiction requirements of other agencies, such as the U.S. Environmental Protection Agency (USEPA), are not affected by the Board's "no further requirements" determination. Such agencies may choose to make their own determination concerning the site.

If you have any questions, please contact Alex Carlos at (213) 266-7583.

APPENDIX B

KW Brown Report, December 4, 1998

L. David Parker

Los Angeles Regional Manager

818-549-9303

dparker@kwbes.com

December 4, 1998
Project No. 329801

Mr. Alex Carlos
California Regional Water Quality Control Board
Los Angeles Region
101 Centre Plaza Drive
Monterey Park, California 91754-2156

RE: Environmental Monitoring Data, Former Lockheed Martin Plant B-6 (File No. 104.0674)

Dear Mr. Carlos:

In response to the Regional Water Quality Control Boards' (RWQCB) October 22, 1998 request for additional information, KW Brown is pleased to transmit the following information. This information is being submitted on behalf of the Burbank-Glendale-Pasadena Airport Authority (BGPAA).

This transmittal consists of two information packages.

Package 1 – Alley Area, includes a summary of analytical data collected by Tetra Tech and ENSR associated with the alley area located between former Buildings 309/310 and 311. The location of the various exploration points is illustrated on the attached plate labeled *Alley Area Boring Locations*. Analytical data associated with these explorations are summarized in a series of tables as follows:

- Table 1 – Alley Area Analytical Summary
- Table 1A - Alley Area, Soil Sampling Analytical Results, Petroleum Hydrocarbons
- Table 1B - Alley Area, Soil Sampling Analytical Results, Volatile Organic Compounds
- Table 1C - Alley Area, Soil Sampling Analytical Results, Metals

Package 2 – Sewage Sump Area, includes a summary of analytical data collected by Tetra Tech and ENSR associated with the former sewage sump area within the former Building 352 Complex. The location of soil borings is illustrated on attached plate labeled *Sewage Sump Area Boring Locations*. Analytical data associated with these explorations are summarized in a series of tables as follows:

- Table 2 – Sump Area Boring Summary

- Table 2A - Sump Area, Soil Sampling Analytical Results, Petroleum Hydrocarbons
- Table 2B - Sump Area, Soil Sampling Analytical Results, Volatile Organic Compounds
- Table 2C - Sump Area, Soil Sampling Analytical Results, Metals
- Table 2-D - Sump Area, Soil Sampling Analytical Results, Polychlorinated Biphenyls

Please note the above listed tables only contain analytical data that returned a positive result for the presence of the tested constituents. These tables do not include all the non-detect data. Where a dash line (-) appears in the tables, no positive result was recorded for that constituent at that sample location.

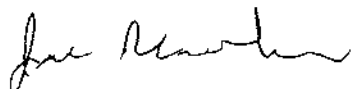

As referenced in our December 2, 1998 letter, the locations and data associated with concentrations above the RWQCB screening levels will be submitted by January 4, 1998.

Should you have any questions or comments regarding the above, please contact the undersigned at 818-549-9303.

Sincerely,
KW Brown & Associates, Inc.

Notes:

- 1.) Total Petroleum Hydrocarbons (TPH), by EPA Methods 418.1, 8015 fuel fingerprint.
- 2.) Volatile Organic Compounds (VOC), by EPA Methods 8020, 8240,8260.
- 3.) Semi-volatile Organic Compounds (SVOC), by EPA Method 8270.
- 4.) Polychlorinated Biphenyl (PCB), by EPA Method 8080.
- 5.) Metals, by EPA Method CAM-17.

Project No. 329801

Mr. Alex Carlos

California Regional Water Quality Control Board

Los Angeles Region

101 Centre Plaza Drive

Monterey Park, California 91754-2156

RE: Environmental Monitoring Data, Former Lockheed Martin Plant B-6 (File No. 104.0674)

Dear Mr. Carlos:

In response to the Regional Water Quality Control Boards' (RWQCB) October 22, 1998 request for additional information, KW Brown is pleased to transmit the following data. This information is being submitted on behalf of the Burbank-Glendale-Pasadena Airport Authority (BGPAA).

This transmittal consists of one information package designated as Data Package 3 – Contaminant Concentrations Greater Than Screening Level. Data Packages 1 – Alley Area and 2 – Sewage Sump Area were previously transmitted to you on December 4, 1998. This submittal completes the request for additional information in your October 22, 1998 letter.

Package 3 includes a summary of analytical data from soil borings drilled and sampled by Tetra Tech and ENSR. The data presents soil contaminant concentrations, which remain on the B-6 site, that are greater than the RWQCB screening level for the various constituents. The analytical data are summarized in a series of tables as follows:

- Table 3 – Analytical Summary – Constituents Greater Than Screening Level
- Table 3A - Soil Sampling Analytical Results - Greater Than Screening Level - Petroleum Hydrocarbons
- Table 3B - Soil Sampling Analytical Results - Greater Than Screening Level - Volatile Organic Compounds
- Table 3C - Soil Sampling Analytical Results - Greater Than Screening Level – Polychlorinated Biphenyls
- Table 3D - Soil Sampling Analytical Results, Greater Than Screening Level - Metals

The location of the soil borings indicated in the tables are illustrated on the attached plot plan entitled *Soil Boring Locations – With Concentrations Greater Than Screening Level*.

Table 3 summarizes the borings that contain concentrations of the various constituents, greater than the screening levels.

Table 3A presents petroleum hydrocarbon data, which is in excess of the Interim Site Assessment & Cleanup Guidebook, May 1996 screening criteria for Total Petroleum Hydrocarbons (TPH). Table 3B presents volatile organic compound (VOC) data which is also in excess of the Interim Site Assessment & Cleanup Guidebook, May 1996 screening criteria for VOC's. The screening criteria used in the Interim Site Assessment & Cleanup Guidebook is dependent on depth to groundwater. In developing these screening levels, a depth to groundwater, based on previous ground water monitoring data collected at the B-6 site, of 250 feet below ground surface was used. This screening criterion is also dependent on soil stratigraphy. For the purposes of this submittal, stratigraphy was assumed to consist of 60 percent gravel/sand and 40 percent sand/silt (based on boring logs from the B-6 site).

Table 3C presents polychlorinated biphenyl (PCB) data which is in excess of the 340 ug/kg standard used by Lockheed and approved by the RWQCB for cleanup of PCB contaminated soil in the former Building 353 complex. Table 3D presents metals data, which is in excess of ten times the Soluble Threshold Limit Concentration (STLC) for the various metals.

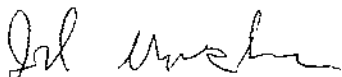

Please note that this submittal contains only data, which exceed the screening levels as described above and in the tables. This is not a complete listing of all the analytical data associated with the borings presented.

Should you have any questions or comments regarding the above, please contact the undersigned at 818-549-9303.

Sincerely,
KW Brown & Associates, Inc.

**Re: Thallium and Chromium Sampling Results, Former Lockheed Plant B-6,
Burbank, California**

Dear Mr. Feger:

ENSR is pleased to present this letter report that summarizes the results of subsurface soil sampling on the former Lockheed Plant B-6 site. This sampling was conducted to provide additional information relative to the presence of thallium and chromium in the subsurface.

Background

In anticipation of the sale of the Trust Property portion of the B-6 site, ENSR collected, compiled, and reviewed existing subsurface assessment data. The review indicated the presence of total thallium and chromium at levels greater than ten times their Soluble Threshold Limit Concentration (STLC) at two specific locations on site. Although these concentrations do not, in themselves, constitute a hazard, total metal concentrations greater than ten times their STLC represent the potential for a contaminated condition.

During site assessment investigations, it is common for the investigating laboratory to run total metal concentration analysis rather than the STLC analysis. The STLC analysis is considerably more complicated and expensive. As an industry "rule-of-thumb", the total metals concentrations are commonly compared to ten times their STLC to determine the potential for a hazardous and/or contaminated condition. In fact, during assessment activities on the B-6 site in the 1990's, the Los Angeles Regional Water Quality Control Board (LARWQCB) established this criteria as an action level for metals. When laboratory analytical results for total metals concentrations exceed ten times the STLC, it is common to re-analyze the sample for the actual STLC to determine whether or not a contaminated condition exists. Soil containing concentrations of metals in excess of their STLC is considered a California Hazardous Waste and is subject to remediation.

The STLC for thallium is 7 mg/kg; therefore, the total concentration action level is 70 mg/kg. The data review indicated that thallium, in excess of 70 mg/kg, was present at a depth of 10 feet in the vicinity of former Building 353, and at a depth of 30 feet in the vicinity of the former Building 333 Pump House. During the original sampling, confirmation STLC analyses were not run.

Mr. Dan Feger
May 4, 2001
Page 2

The STLC for chromium is 560 milligrams/kilogram (mg/kg) and the STLC for hexavalent chromium is 5 mg/kg. During the original sampling, no distinction was made for the valence of the chromium analyzed, therefore, the more conservative STLC value of 5 mg/kg results in a total concentration action level at 50 mg/kg. The data review indicated that chromium, in excess of 50 mg/kg, was present at depths between 10 and 20 feet in the vicinity of former Building 353, however, the STLC analyses were not run at that time.

The purpose of this additional sampling was to determine if thallium and chromium are present at concentrations greater than their STLC. To achieve this goal, ENSR collected and analyzed soil samples from these two locations.

Soil Sampling

On April 4, 2001 a GeoProbe direct-push soil-sampling rig was utilized to advance a total of 4 soil borings. Boring SB-1 was advanced in the vicinity of the former Building 333 Pump House where previous soil sampling had indicated elevated levels of thallium. Soil samples were collected at depths of 10, 20, and 28 feet. The soil samples were packaged, labeled, and placed on ice for delivered to the analytical laboratory for analysis.

Borings SB-2, SB-3, and SB-4 were advanced in the vicinity of the former Building 353 where previous soil sampling had indicated elevated levels of thallium and chromium. Soil samples were generally collected at depths of 10 and 20 feet. The soil samples were packaged, labeled, and placed on ice for delivered to the analytical laboratory for analysis.

Laboratory Analysis

The laboratory program was designed to systematically analyze for the presence of thallium and chromium. Initially, total concentration analyses using EPA method 6010B-SCAN were run on all samples to determine if the thallium and chromium existed at concentration greater than ten times their STLC.

In instances where thallium and chromium were present at concentrations greater than ten times the STLC, then the STLC analyses were run using EPA method 6010B-STLC.

Findings

The laboratory analytical results are summarized in Table 1 and the laboratory analytical reports are included as Attachment 1 – Laboratory Documentation. The laboratory results presented in Table 1 indicate that total thallium was not recorded in any of the samples collected, therefore, no additional STLC analyses were conducted.

Mr. Dan Feger
 May 4, 2001
 Page 3

The laboratory results presented in Table 1 indicate that total chromium concentrations were recorded in all samples collected. Based on these results, all samples recording a total value greater than 50 mg/kg were analyzed for STLC. Similarly, the chromium STLC results greater than 5 mg/kg were analyzed for hexavalent chromium STLC.

Table 1 – Summary Laboratory Results

Boring	Depth	Total Concentration Results (mg/kg)				STLC Results (mg/kg)			
		Thallium		Chromium		Chromium		Hex Chromium	
		Result	10xSTLC	Result	10xSTLC	Result	STLC	Result	STLC
SB-1	10	ND	70	6.5	5,600	ND	560	-	5
	20	ND	70	3.9	5,600	-	560	-	5
	28	ND	70	3.8	5,600	-	560	-	5
SB-2	10	ND	70	4.6	5,600	-	560	-	5
	20	ND	70	4.7	5,600	-	560	-	5
SB-3	10	ND	70	23.3	5,600	0.53	560	-	5
	18	ND	70	787	5,600	18.7	560	ND	5
SB-4	10	ND	70	4.7	5,600	-	560	-	5
	20	ND	70	6.2	5,600	0.29	560	-	5

Sample SB-3-18 recorded a total chromium concentration of 787 mg/kg, which was greater than the target level of 50 mg/kg. All other samples recorded concentrations less than the target level of 50 mg/kg. Sample SB-3-18 was selected for STLC analysis. Conservatively, samples SB-1-10, SB-3-10, and SB-4-20 recorded concentrations above 5 mg/kg and were also analyzed for their STLC.

The chromium STLC analyses results indicated that only sample SB-3-18 recorded an STLC greater than the hexavalent chromium limit of 5 mg/kg. All other STLC results were well below 5 mg/kg. Sample SB-3-18 was subsequent run for just the hexavalent chromium STLC. This final analysis recorded a not-detected (ND) result for hexavalent chromium STLC in sample SB-3-18.

Mr. Dan Feger
May 4, 2001
Page 4

Conclusions

The analytical results indicate that thallium and chromium were either not detectable or below levels which would require additional assessment or remediation in the areas examined.

Limitations

The analyses and interpretations in this report have been developed based on the review of existing information pertaining to the site, results of soil sampling, and the laboratory analyses of soil samples. It should be recognized that subsurface contamination could vary laterally and with depth below a given site. While sample locations are considered representative of specific test locations, ENSR does not warrant that the results contained herein are representative of the entire site.

ENSR is pleased to be of service to you on this important project. If you have any questions regarding our report or findings, please contact either of the undersigned.

Sincerely,

D.J. Poehls
Project Geologist

L. David Parker
Senior Project Manager

Data Qualifiers and Descriptors

Data Qualifier:

- B: Analyte was present in the Method Blank.
- D: Result is from a diluted analysis.
- E: Result is beyond calibration limits and is estimated.
- J: Analyte was detected . However, the analyte concentration is an estimated value, which is between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL).

Definition:

- %Limi: Percent acceptable limits.
- %REC: Percent recovery.
- Con.L: Acceptable Control Limits
- Conce: Added concentration to the sample.
- LCS: Laboratory Control Sample
- MDL: Method Detection Limit
- MS: Matrix Spike
- MS DU: Matrix Spike Duplicate
- ND: Analyte was not detected in the sample at or above MDL.
- PQL: Practical Quantitation Limit or ML (Minimum Level as per RWQCB) is the minimum concentration that can be quantified with more than 99% confidence. Taking into account all aspects of the entire analytical instrumentation and practice.
- Recov: Recovered concentration in the sample.
- RPD: Relative Percent Difference

SUBJECT: REQUIREMENT FOR TECHNICAL REPORT PURSUANT TO CALIFORNIA WATER CODE SECTION 13267 ORDER NO. R4-2013-0063

SITE: FORMER LOCKHEED MARTIN CORPORATION PLANTS A-1 NORTH LOCATED AT 2555 NORTH HOLLYWOOD WAY, BURBANK, CALIFORNIA (FILE NO. 104.5152); B-1 LOCATED AT 1705 VICTORY PLACE, BURBANK CALIFORNIA (FILE NO. 104.0676); B-6 LOCATED AT 2801 NORTH HOLLYWOOD WAY, BURBANK, CALIFORNIA (FILE NO. 104.0674); AND C-1 LOCATED AT 10720 SHERMAN WAY, BURBANK, CALIFORNIA (FILE NO. 104.1343)

Dear Ms. Monteith:

The California Regional Water Quality Control Board, Los Angeles Region (Regional Board) is the state regulatory agency responsible for protecting water quality in the Los Angeles and Ventura Counties, pursuant to the Porter-Cologne Water Quality Control Act. To accomplish this, the Regional Board issues investigative and cleanup orders to parties responsible for discharges of waste at sites within the Los Angeles Region.

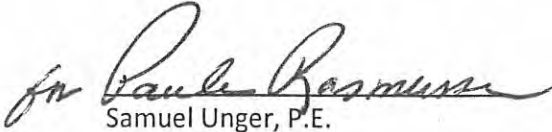

The Regional Board is investigating potential sources for groundwater pollution within the United States Environmental Protection Agency (USEPA) San Fernando Valley Superfund Site (Superfund Site). It is known that groundwater within the Superfund Site, including the vicinity of the various former Lockheed Martin Corporation (Lockheed) facilities, is polluted with volatile organic compounds (VOCs) and heavy metals, particularly chromium.

Based on our review of recent report submittals and historical documents, Regional Board staff has concluded that several areas of concern remain at the various former Lockheed facilities.

Enclosed is a Regional Board Order for technical report requirements pursuant to California Water Code (CWC) Section 13267 Order No. R4-2013-0063 (Order). As the responsible party, you are required to comply with the Order to prepare and submit an Additional Site Investigation Workplan in order to evaluate the potential for soil and groundwater contamination at the various former Lockheed facilities.

Should you have any questions related to this project, please contact Mr. Larry Moore via telephone at (213) 576-6730 or via email at lmoore@waterboards.ca.gov.

Sincerely,

A handwritten signature in cursive script, appearing to read "for Paul Rasmussen".

Samuel Unger, P.E.
Executive Officer

Mr. Gene Matsushita, Lockheed Martin Corporation

Los Angeles Regional Water Quality Control Board

**ORDER TO PROVIDE A TECHNICAL REPORT FOR
ADDITIONAL SITE INVESTIGATION
CALIFORNIA WATER CODE SECTION 13267 ORDER NO. R4-2013-0063**

DIRECTED TO LOCKHEED MARTIN CORPORATION

**FORMER LOCKHEED MARTIN CORPORATION PLANTS A-1 NORTH LOCATED AT
2555 NORTH HOLLYWOOD WAY, BURBANK, CALIFORNIA (FILE NO. 104.5152);
B-1 LOCATED AT 1705 VICTORY PLACE, BURBANK CALIFORNIA (FILE NO. 104.0676);
B-6 LOCATED AT 2801 NORTH HOLLYWOOD WAY, BURBANK, CALIFORNIA (FILE NO. 104.0674);
AND C-1 LOCATED AT 10720 SHERMAN WAY, BURBANK, CALIFORNIA (FILE NO. 104.1343)**

The California Regional Water Quality Control Board, Los Angeles Region (Regional Board) makes the following findings and issues this Order pursuant to California Water Code (CWC) section 13267.

1. The groundwater within the San Fernando Valley Groundwater Basin has been polluted by volatile organic compounds (VOCs) and heavy metals, specifically chromium. As a result of the groundwater pollution, the Regional Board is investigating potential sources of the pollution. The current investigation, led by the United States Environmental Protection Agency (USEPA) and the Regional Board, is focused on identifying individuals and companies responsible for the discharges of chromium in the region and holding them responsible for the investigation and remediation of the affected Site. The above referenced facilities are located in the investigative area.
2. Pursuant to CWC section 13304, the Regional Board issued Cleanup and Abatement Order (CAO) No. 1987-161, on December 17, 1987, to Lockheed Aeronautical Systems Company, a division of Lockheed Corporation (now Lockheed Martin Corporation, hereinafter referred to as Lockheed). The CAO directed Lockheed to clean up waste and abate the effects of discharges of waste to soil and groundwater contamination at various former Lockheed facilities in the city of Burbank and to determine the source and extent of the discharges. Lockheed conducted several phases of subsurface soil and groundwater investigations under the Regional Boards' order. Regional Board staff has reviewed the documents contained in the case file and determined that the previous investigations performed at the various former Lockheed facilities did not fully delineate the extent of the waste discharges in the subsurface.
3. CWC section 13267(b)(1) states, in part: In conducting an investigation the Regional Board may require that any person who has discharged, discharges, or is suspected of having discharged or, discharging, or who proposes to discharge waste within its region shall furnish, under penalty of perjury, technical or monitoring program reports which the Regional Board requires. The burden, including costs, of these reports shall bear a reasonable relationship to the need for the report and the benefits to be obtained from the reports. In requiring those reports, the Regional Board shall provide the person with a written explanation with regard to the need for the reports, and shall identify the evidence that supports requiring that person to provide the reports.

4. Regional Board staff has reviewed the "Technical Report, Soils Data for Former Lockheed Martin Plants in Burbank," dated April 2012, as well as historical documents contained in our case files for the various former Lockheed facilities. Despite the amount of work already performed at the various former Lockheed facilities, Regional Board staff has concluded that several areas of concern still remain. Previously investigated areas of the former plants A-1 North, B-1, B-6, and C-1, as well as areas affected by historical industrial waste water discharge produced from the various former Lockheed facilities have not been fully delineated with respect to VOCs or hexavalent chromium. Therefore, Regional Board staff has determined that an additional subsurface investigation is required, as described in the enclosed Table – Areas of Concern and Requirements for Additional Investigation, in order to fully delineate the VOCs and the hexavalent chromium in the subsurface soil and groundwater.
5. This Order identifies Lockheed as the entity responsible for the suspected discharge of waste identified in paragraph two (2) and four (4) because Lockheed owned and operated the activities that resulted in the suspected discharges of waste.
6. This Order requires Lockheed to prepare and submit an Additional Site Investigation Workplan (Workplan) in order to fully delineate the extent of the wastes discharged beneath the various former Lockheed facilities and determine if the wastes pose a threat to groundwater. You are expected to submit a complete Workplan, as required by this Order, to the Regional Board. The Regional Board may reject the Workplan if it is deemed not to be complete and/or require revisions to the Workplan under this Order.
7. The Regional Board needs this information in order to determine the subsurface soil conditions at the various former Lockheed facilities as part of the efforts to identify sources of pollution in the San Fernando Valley.
8. The burdens, including costs, of these reports bear a reasonable relationship to the need for the reports and the benefits to be obtained from the reports. The information is necessary to assure adequate cleanup of the various former Lockheed facilities, which as described above may have discharged waste detected in the subsurface soil and groundwater and potentially poses significant threats to public health and the environment.
9. The issuance of this Order is an enforcement action by a regulatory agency and is categorically exempt from the provisions of the California Environmental Quality Act (CEQA) pursuant to section 15321(a)(2), Chapter 3, Title 14 of the California Code of Regulations. This Order requires submittal of technical and/or monitoring reports and workplans. The proposed activities under the Workplan are not yet known. It is unlikely that implementation of the Workplan associated with this Order could result in anything more than minor physical changes to the environment. If the implementation may result in significant impacts on the environment, the appropriate lead agency will address the CEQA requirements prior to implementing any Workplan.
10. Any person aggrieved by this action of the Regional Board may petition the State Water Resources Control Board (State Board) to review the action in accordance with Water Code section 13320 and California Code of Regulations, title 23, sections 2050 and following. The State Board must receive the petition by 5:00 p.m., 30 days after the date of this Order, except

that if the thirtieth day following the date of this Order falls on a Saturday, Sunday, or state holiday, the petition must be received by the State Board by 5:00 p.m. on the next business day. Copies of the law and regulations applicable to filing petitions may be found on the Internet at the following link:

http://www.waterboards.ca.gov/public_notices/petitions/water_quality

or will be provided upon request.

THEREFORE, IT IS HEREBY ORDERED that Lockheed, pursuant to section 13267(b) of the CWC, is required to comply with the following:

1. Submit an Additional Site Investigation Workplan (Workplan) by **June 5, 2013**. Guidance documents to assist you with this task can be found on the Internet at the following links:

"General Work Plan Requirements for a Heavy Metal Soil Investigation"

http://www.waterboards.ca.gov/losangeles/water_issues/programs/remediation/GeneralWorkplanRequirementsforaHeavyMetalsSoilInvestigation.pdf

"Interim Site Assessment & Cleanup Guidebook (May1996),"

http://www.waterboards.ca.gov/losangeles/water_issues/programs/remediation/may1996_voc_guidance.shtml

"Quality Assurance Project Plan"

http://www.waterboards.ca.gov/losangeles/water_issues/programs/remediation/Board_SGV-SFVCleanupProgram_Sept2008_QAPP.pdf

2. The Workplan must completely delineate the extent of waste constituents, specifically VOCs and hexavalent chromium, in the subsurface soil and groundwater originated from the various former Lockheed facilities. Subsequent workplans may be required, if additional work is necessary, in order to fully delineate the extent of the wastes.
3. The Workplan shall address all areas of concern as specified in the enclosed Table – Areas of Concern and Requirements for Additional Investigation.
4. The Workplan must contain a health and safety plan (HASP), as per the guidelines.

The above item shall be submitted to:

Mr. Larry Moore
Staff Environmental Scientist
Remediation Section
Los Angeles Regional Water Quality Control Board
320 West 4th Street, Suite 200
Los Angeles, California 90013
Phone: (213) 576-6730
Email: lmoore@waterboards.ca.gov

Pursuant to section 13267(a) of the CWC, any person who fails to submit reports in accordance with the Order is guilty of a misdemeanor. Pursuant to section 13268(b)(1) of the CWC, failure to submit the required Workplan described above by the specified due date(s) may result in the imposition of administrative civil liability by the Regional Board in an amount up to one thousand dollars (\$1,000) per day for each day the Workplan is not received after the above due date. These civil liabilities may be assessed by the Regional Board for failure to comply, beginning with the date that the violations first occurred, and without further warning.

The Regional Board, under the authority given by the CWC section 13267, subdivision (b)(1), requires you to include a perjury statement in all reports submitted under the 13267 Order. The perjury statement shall be signed by a senior authorized Lockheed representative (not by a consultant). The perjury statement shall be in the following format:

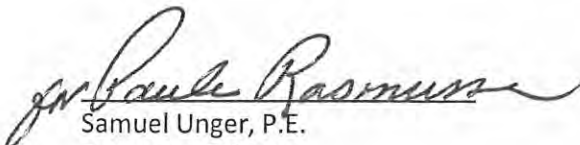

"I, [NAME], certify under penalty of law that this document and all attachments were prepared by me, or under my direction or supervision, in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

The State Board adopted regulations (Chapter 30, Division 3 of Title 23 & Division 3 of Title 27, California Code of Regulation) requiring the electronic submittal of information (ESI) for all site cleanup programs, starting January 1, 2005. Currently, all of the information on electronic submittals and GeoTracker contacts can be found on the Internet at the following link:

http://www.waterboards.ca.gov/ust/electronic_submittal.

To comply with the above referenced regulation, you are required to upload all technical reports, documents, and well data to GeoTracker by the due dates specified in the Regional Board letters and orders issued to you or for the Site. However, the Regional Board may request that you submit hard copies of selected documents and data in addition to electronic submittal of information to GeoTracker.

SO ORDERED.

Samuel Unger, P.E.
Executive Officer

April 18, 2013
Date

Enclosure: Table – Areas of Concern and Requirements for Additional Investigation

Table – Areas of Concern and Requirements for Additional Investigation

Area of Concern	Minimum Number of Borings and Target Depth	Analytical Requirements - Soil Matrix or Soil Gas for VOCs	Groundwater Investigation Requirements	Rationale for Investigation Requirement
B-1 Historic Injection well - Dry well 1 (DW-1)	Two soil borings through the vadose zone to the fine-grained unit, between 115 feet and 150 feet below ground surface	Chromium (total and hexavalent)	TBD (well CW-29 may suffice)	Industrial waste water containing Cr6 may have been discharged via this feature
B-1 - DW-2	Two soil borings through the vadose zone to the fine-grained unit, between 115 feet and 150 feet below ground surface	Chromium (total and hexavalent)	Three new groundwater monitoring wells between CW-29 and CW-12	Industrial waste water containing Cr6 may have been discharged via this feature
B-1 - DW-3	One soil boring through the vadose zone to the fine-grained unit, between 115 feet and 150 feet below ground surface	Chromium (total and hexavalent)	TBD	Industrial waste water containing Cr6 may have been discharged via this feature
B-1 - DW-4	One soil boring through the vadose zone to the fine-grained unit, between 115 feet and 150 feet below ground surface; Install soil vapor probes at depth to be determined for VOCs	Chromium (total and hexavalent); PCE and TCE, and other VOCs, as needed, in soil vapor	TBD	Industrial waste water containing Cr6 and VOCs may have been discharged via this feature
B-1 - DW-5	One soil boring through the vadose zone to the fine-grained unit, between 115 feet and 150 feet below ground surface; Install soil vapor probes at depth to be determined for VOCs	Chromium (total and hexavalent); PCE and TCE, and other VOCs, as needed, in soil vapor	TBD	Industrial waste water containing Cr6 and VOCs may have been discharged via this feature

Table – Areas of Concern and Requirements for Additional Investigation

Area of Concern	Minimum Number of Borings and Target Depth	Analytical Requirements - Soil Matrix or Soil Gas for VOCs	Groundwater Investigation Requirements	Rationale for Investigation Requirement
B-1 - DW-6	One soil boring through the vadose zone to the fine-grained unit, between 115 feet and 150 feet below ground surface; Install soil vapor probes at depth to be determined for VOCs	Chromium (total and hexavalent); PCE and TCE, and other VOCs, as needed, in soil vapor	TBD	Industrial waste water containing Cr6 and VOCs may have been discharged via this feature
B-1 Building 175 Vapor Degreaser and Clarifier	Two soil borings through the vadose zone to the fine-grained unit between 115 feet and 150 feet below ground surface; Install soil vapor probes at depths to be determined for VOCs	PCE in soil vapor	TBD	Area of historic PCE release does not appear to be adequately delineated or mitigated
B-1 Building 194/195	Two soil borings through the vadose zone to the fine-grained unit greater than 40 feet below ground surface; Install soil vapor probes at depth to be determined for VOCs	Chromium (total and hexavalent); PCE and TCE, and other VOCs, as needed, in soil vapor	TBD	Area of previous soil investigations is not delineated for Cr6
B-1 Former Buried Waste Area	Two soil borings through the vadose zone to the fine-grained unit greater than 40 feet below ground surface; Install soil vapor probes at depth to be determined for VOCs	Chromium (total and hexavalent); PCE and TCE, and other VOCs, as needed, in soil vapor	TBD	Area of historic and undocumented waste disposal has not been adequately delineated
A-1 North Former Cr6 Passivation Area	Two soil borings through the vadose zone to the fine-grained unit between approximately 80 feet and 100 feet below ground surface	Chromium (total and hexavalent)	Two - three new groundwater monitoring wells	Area of historic Cr6 release has not been adequately delineated

Table – Areas of Concern and Requirements for Additional Investigation

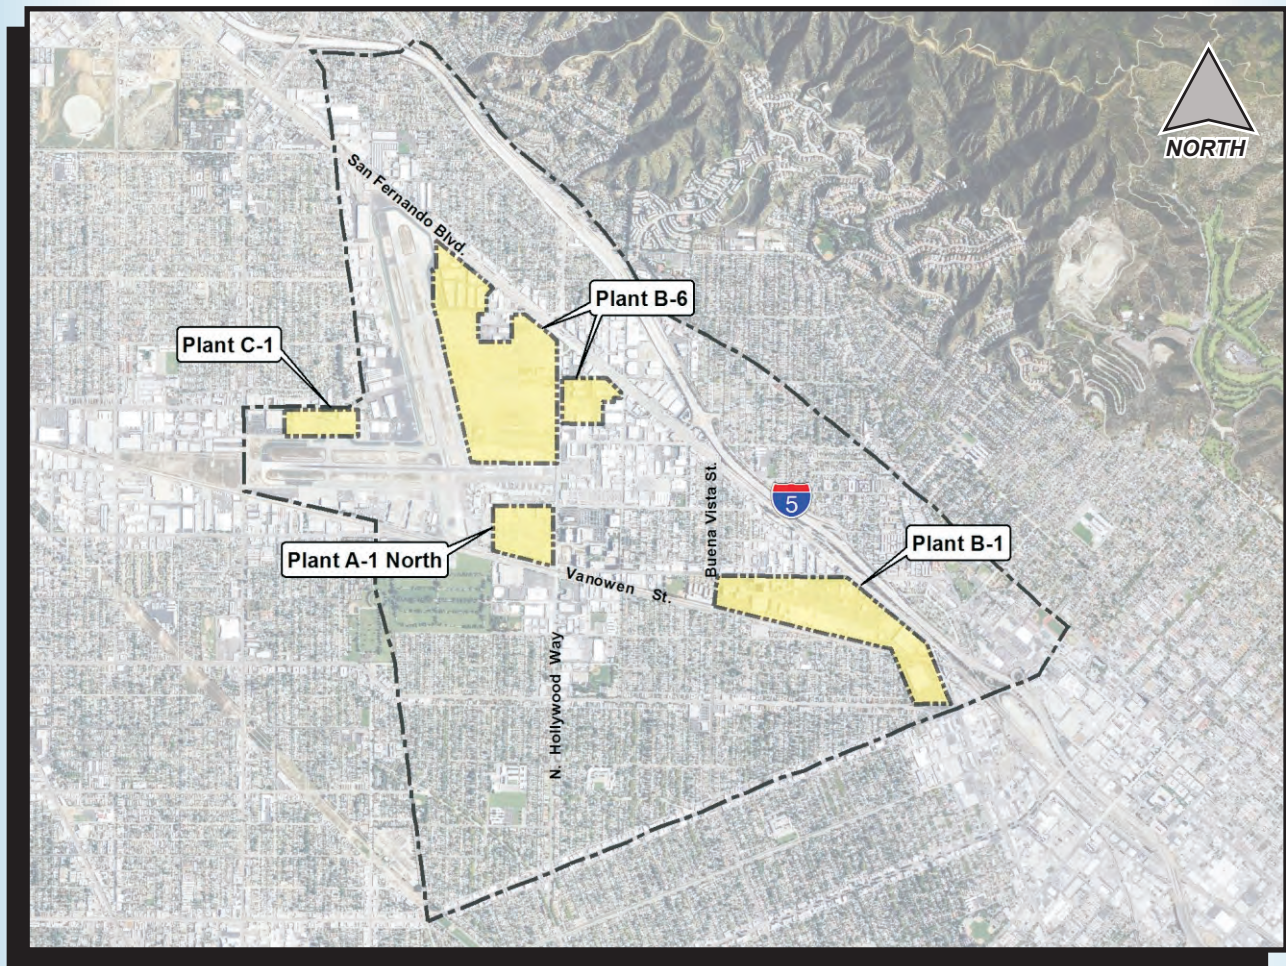

Area of Concern	Minimum Number of Borings and Target Depth	Analytical Requirements - Soil Matrix or Soil Gas for VOCs	Groundwater Investigation Requirements	Rationale for Investigation Requirement
B-6 Building 371 Former Cr6 Passivation Area	Two soil borings through the vadose zone to the fine-grained unit between 80 feet and 100 feet below ground surface; Install soil vapor probes at depth to be determined for VOCs.	Chromium (total and hexavalent)	TBD	Area of historic Cr6 and VOC release has not been adequately delineated
B-6 Building 357 - Dry Wells	One soil boring through the vadose zone to the fine-grained unit between 80 feet and 100 feet below ground surface, per feature identified.	Chromium (total and hexavalent)	TBD	Industrial waste water containing Cr6 may have been discharged via these features
B-6 Building 353 Dry Wells and Clarifier B-6-F	One soil boring through the vadose zone to the fine-grained unit between 80 feet and 100 feet below ground surface, per feature identified.	Chromium (total and hexavalent)	TBD	Industrial waste water containing Cr6 may have been discharged via these features; Area of previous soil investigation was not delineated for Cr6.
B-6 Building 340 Dry Wells	One soil boring through the vadose zone to the fine-grained unit between 80 feet and 100 feet below ground surface, per feature identified	Chromium (total and hexavalent)	TBD	Industrial waste water containing Cr6 may have been discharged via these features
B-6 Building 332-333 Dry Well locations	One soil boring through the vadose zone to the fine-grained unit between 80 feet and 100 feet below ground surface, per feature identified	Chromium (total and hexavalent)	TBD	Industrial waste water containing Cr6 may have been discharged via these features

Table – Areas of Concern and Requirements for Additional Investigation

Area of Concern	Minimum Number of Borings and Target Depth	Analytical Requirements - Soil Matrix or Soil Gas for VOCs	Groundwater Investigation Requirements	Rationale for Investigation Requirement
B-6 Building 310 Dry Well, Metal Finishing Line, Sump and Sand Traps	One soil boring through the vadose zone to the fine-grained unit between 80 feet and 100 feet below ground surface, per feature identified	Chromium (total and hexavalent)	TBD	Industrial waste water containing Cr6 may have been discharged via these features
B-6 Building 88 Dry Well locations	One soil boring through the vadose zone to the fine-grained unit between 80 feet and 100 feet below ground surface, per feature identified	Chromium (total and hexavalent)	TBD	Industrial waste water containing Cr6 may have been discharged via these features
B-6 Building 83 Cr6 Use (former clarifier, sumps, sand traps and pits)	One soil boring through the vadose zone to the fine-grained unit between 80 feet and 100 feet below ground surface, per feature identified	Chromium (total and hexavalent)	TBD	Industrial waste water containing Cr6 may have been discharged at this location
B-6 Building 82 Metal Finishing Process Line Area (sumps and pits)	One soil boring through the vadose zone to the fine-grained unit between 80 feet and 100 feet below ground surface, per feature identified	Chromium (total and hexavalent)	TBD	Industrial waste water containing Cr6 may have been discharged at this location
C-1 Building 43 Metal Finishing Area (former sump)	One soil boring through the vadose zone to the fine-grained unit between 80 feet and 100 feet below ground surface, per feature identified	Chromium (total and hexavalent)	TBD	Industrial waste water containing Cr6 may have been discharged at this location

*Additional Site Investigation Report Former Lockheed Martin Plants A-1 North, B-1, B-6,
and C-1, Burbank, California*

Dear Mr. Moore:

Please find enclosed Lockheed Martin Corporation's (Lockheed Martin) *Additional Site Investigation Report Former Lockheed Martin Plants A-1 North, B-1, B-6, and C-1* (Report). This document was prepared in response to Los Angeles Regional Water Quality Control Board (Regional Board) issued Order No. R4-2013-0063 (Order).

Lockheed Martin looks forward to continued communication and is prepared to present a summary of the findings to Regional Board. Lockheed Martin also requests a meeting to discuss the need for additional soil and/or groundwater delineation efforts following the Regional Board's assessment of the data evaluation presented in this report.

If you have any questions regarding the enclosed report, please contact me at (720) 842-6121 or liaht.rosenstein@lmco.com.

Sincerely,

EXECUTIVE SUMMARY

This report summarizes recent soil investigations conducted at the former Lockheed Martin Corporation (Lockheed Martin) Burbank facilities (the site). The site is located within the Burbank Operable Unit (BOU) of the San Fernando Valley Superfund Area 1. The investigations were conducted as mandated by the Regional Water Quality Control Board, Los Angeles (Regional Board) pursuant to California Water Code Section 13267 Order No. R4-2013-0063 (the Order), issued to Lockheed Martin on 18 April 2013, in accordance with a Regional Board-approved work plan, and as modified by subsequent Regional Board and Lockheed Martin correspondence. The work plan outlined the investigation of former features at 19 areas of concern (AOCs) at former Plants B-1, B-6, and C-1. All 19 of the AOCs were to be investigated for hexavalent chromium in soil and 8 were to be investigated for volatile organic compounds (VOCs) in soil, with the objective of identifying potential sources that could contribute to groundwater.

A total of 30 soil borings were drilled and sampled in the AOCs from 02 September 2014 to 06 November 2014. Soil samples were collected every 5 feet, and one sample from each 10-foot interval was analyzed for total chromium by United States Environmental Protection Agency (USEPA) Method SW3050B/6020A and hexavalent chromium by USEPA Method SW3060A/7199.

Boreholes in AOCs 2, 4 through 9, and 11 were investigated for VOCs in addition to hexavalent chromium. The work plan protocol included collection of soil samples for VOC testing and installation of soil-gas probes based on field screening results. However, no soil samples exhibited photo-ionization detector (PID) headspace readings greater than the field screening criteria of 50 parts per million (ppm), so no soil samples were analyzed for VOCs and no soil-gas probes were installed.

Total chromium was detected in all of the samples tested. Hexavalent chromium was detected in only 10 of the 30 borings that were completed at the site (in AOCs 2, 7, 8, 9, 11, and 13). A summary of the results of the hexavalent chromium testing is presented in the table below.

Plant	AOC #	Bore Hole #	Depth of Borehole (feet bgs)	Number of Samples Tested	Number of Hexavalent Chromium Detections	Range of Hexavalent Chromium Concentrations (mg/kg)
B-1	1	1	150	15	0	ND<0.10
	2	1	150	18	3	0.217 to 0.918
	3	1	150	17	0	ND<0.10
	4	1	150	14	0	ND<0.10

C-1	20	1	100	10	0	ND<0.10
		2	100	10	0	ND<0.10

Notes: AOC = area of concern bgs = below ground surface mg/kg = milligrams per kilogram
ND = not detected above the limit indicated

Leachability and attenuation capacity of hexavalent chromium (i.e., the natural transformation of hexavalent chromium to trivalent chromium, and the subsequent precipitation of trivalent chromium as a low solubility hydroxide) were evaluated at various locations across the AOCs. Selected samples from various boreholes and depths across the site with and without detections of hexavalent chromium were analyzed for geochemical parameters, geotechnical properties, available hexavalent chromium attenuation capacity (AHCAC), and leachability using a modified Synthetic Precipitation Leaching Procedure (SPLP). The results were used to evaluate the potential future mobility of

residual hexavalent chromium mass detected in the vadose zone, and thus the potential risk of impacts to groundwater.

Key findings from this additional site investigation are summarized below and on Figure ES-1.

- VOCs were not detected in soil vapor above the field screening criteria in any of the AOCs.
- The AHCAC analyses revealed that site soils have the capacity to reduce hexavalent chromium to much less toxic trivalent chromium, resulting in its natural attenuation in the vadose zone. Where reduction of hexavalent chromium to trivalent chromium has occurred, there is no evidence to suggest that the trivalent chromium will be remobilized in the future.

Findings from AOCs 1, 3, 4, 5, 6, 12, 14, 15, 16, 17, 18, 19, and 20

- Hexavalent chromium was not detected in any samples from these 13 AOCs. The features specified in the Order formerly located within these 13 AOCs have been adequately delineated and do not represent a significant current or future source of hexavalent chromium in soil or to groundwater.

Findings from AOCs 2, 11, 13

- Hexavalent chromium was detected in 13 samples from borings located at AOC-2 (former Plant B-1 dry wells), AOC-11 (former Plant B-6 Building 371 chromium passivation area) and AOC-13 (former Plant B-6 Building 357 seepage pits). The calculated AHCAC values for the site indicate that the small mass of hexavalent chromium present in the vadose zone beneath these AOCs is unlikely to migrate to the water table under current conditions. Therefore, no further delineation is recommended for these AOCs and the detected hexavalent chromium does not represent a significant current or future source of hexavalent chromium in soil or to groundwater.

Findings from AOC 7

- Hexavalent chromium was detected in one of the borings in AOC 7 (AOC7-2) from a depth of 10 feet below ground surface (bgs) to drilling refusal at 135 feet. Boring AOC7-2 is associated with a former degreaser located in Building 175 at the former Lockheed Martin Plant B-1. Full delineation of hexavalent chromium in the vicinity of AOC7-2 is not complete and additional investigation may be warranted.
- The analytical results suggest that the hexavalent chromium mass in the vadose zone at AOC7-2 exceeded the AHCAC of the soil to a depth of at least 135 feet, allowing the migration of hexavalent chromium to this depth. Groundwater is presently estimated to be greater than 170 feet bgs.
- The closure of the former manufacturing activities at Building 175 in 1991 eliminated former processes associated with the manufacturing that may have driven infiltration. Although the rate of water migration downward through the vadose zone has not been evaluated at the site, the change in use of the property resulted in less permeable area open to precipitation (the former Building location is presently paved) and concurrent changes in water-use

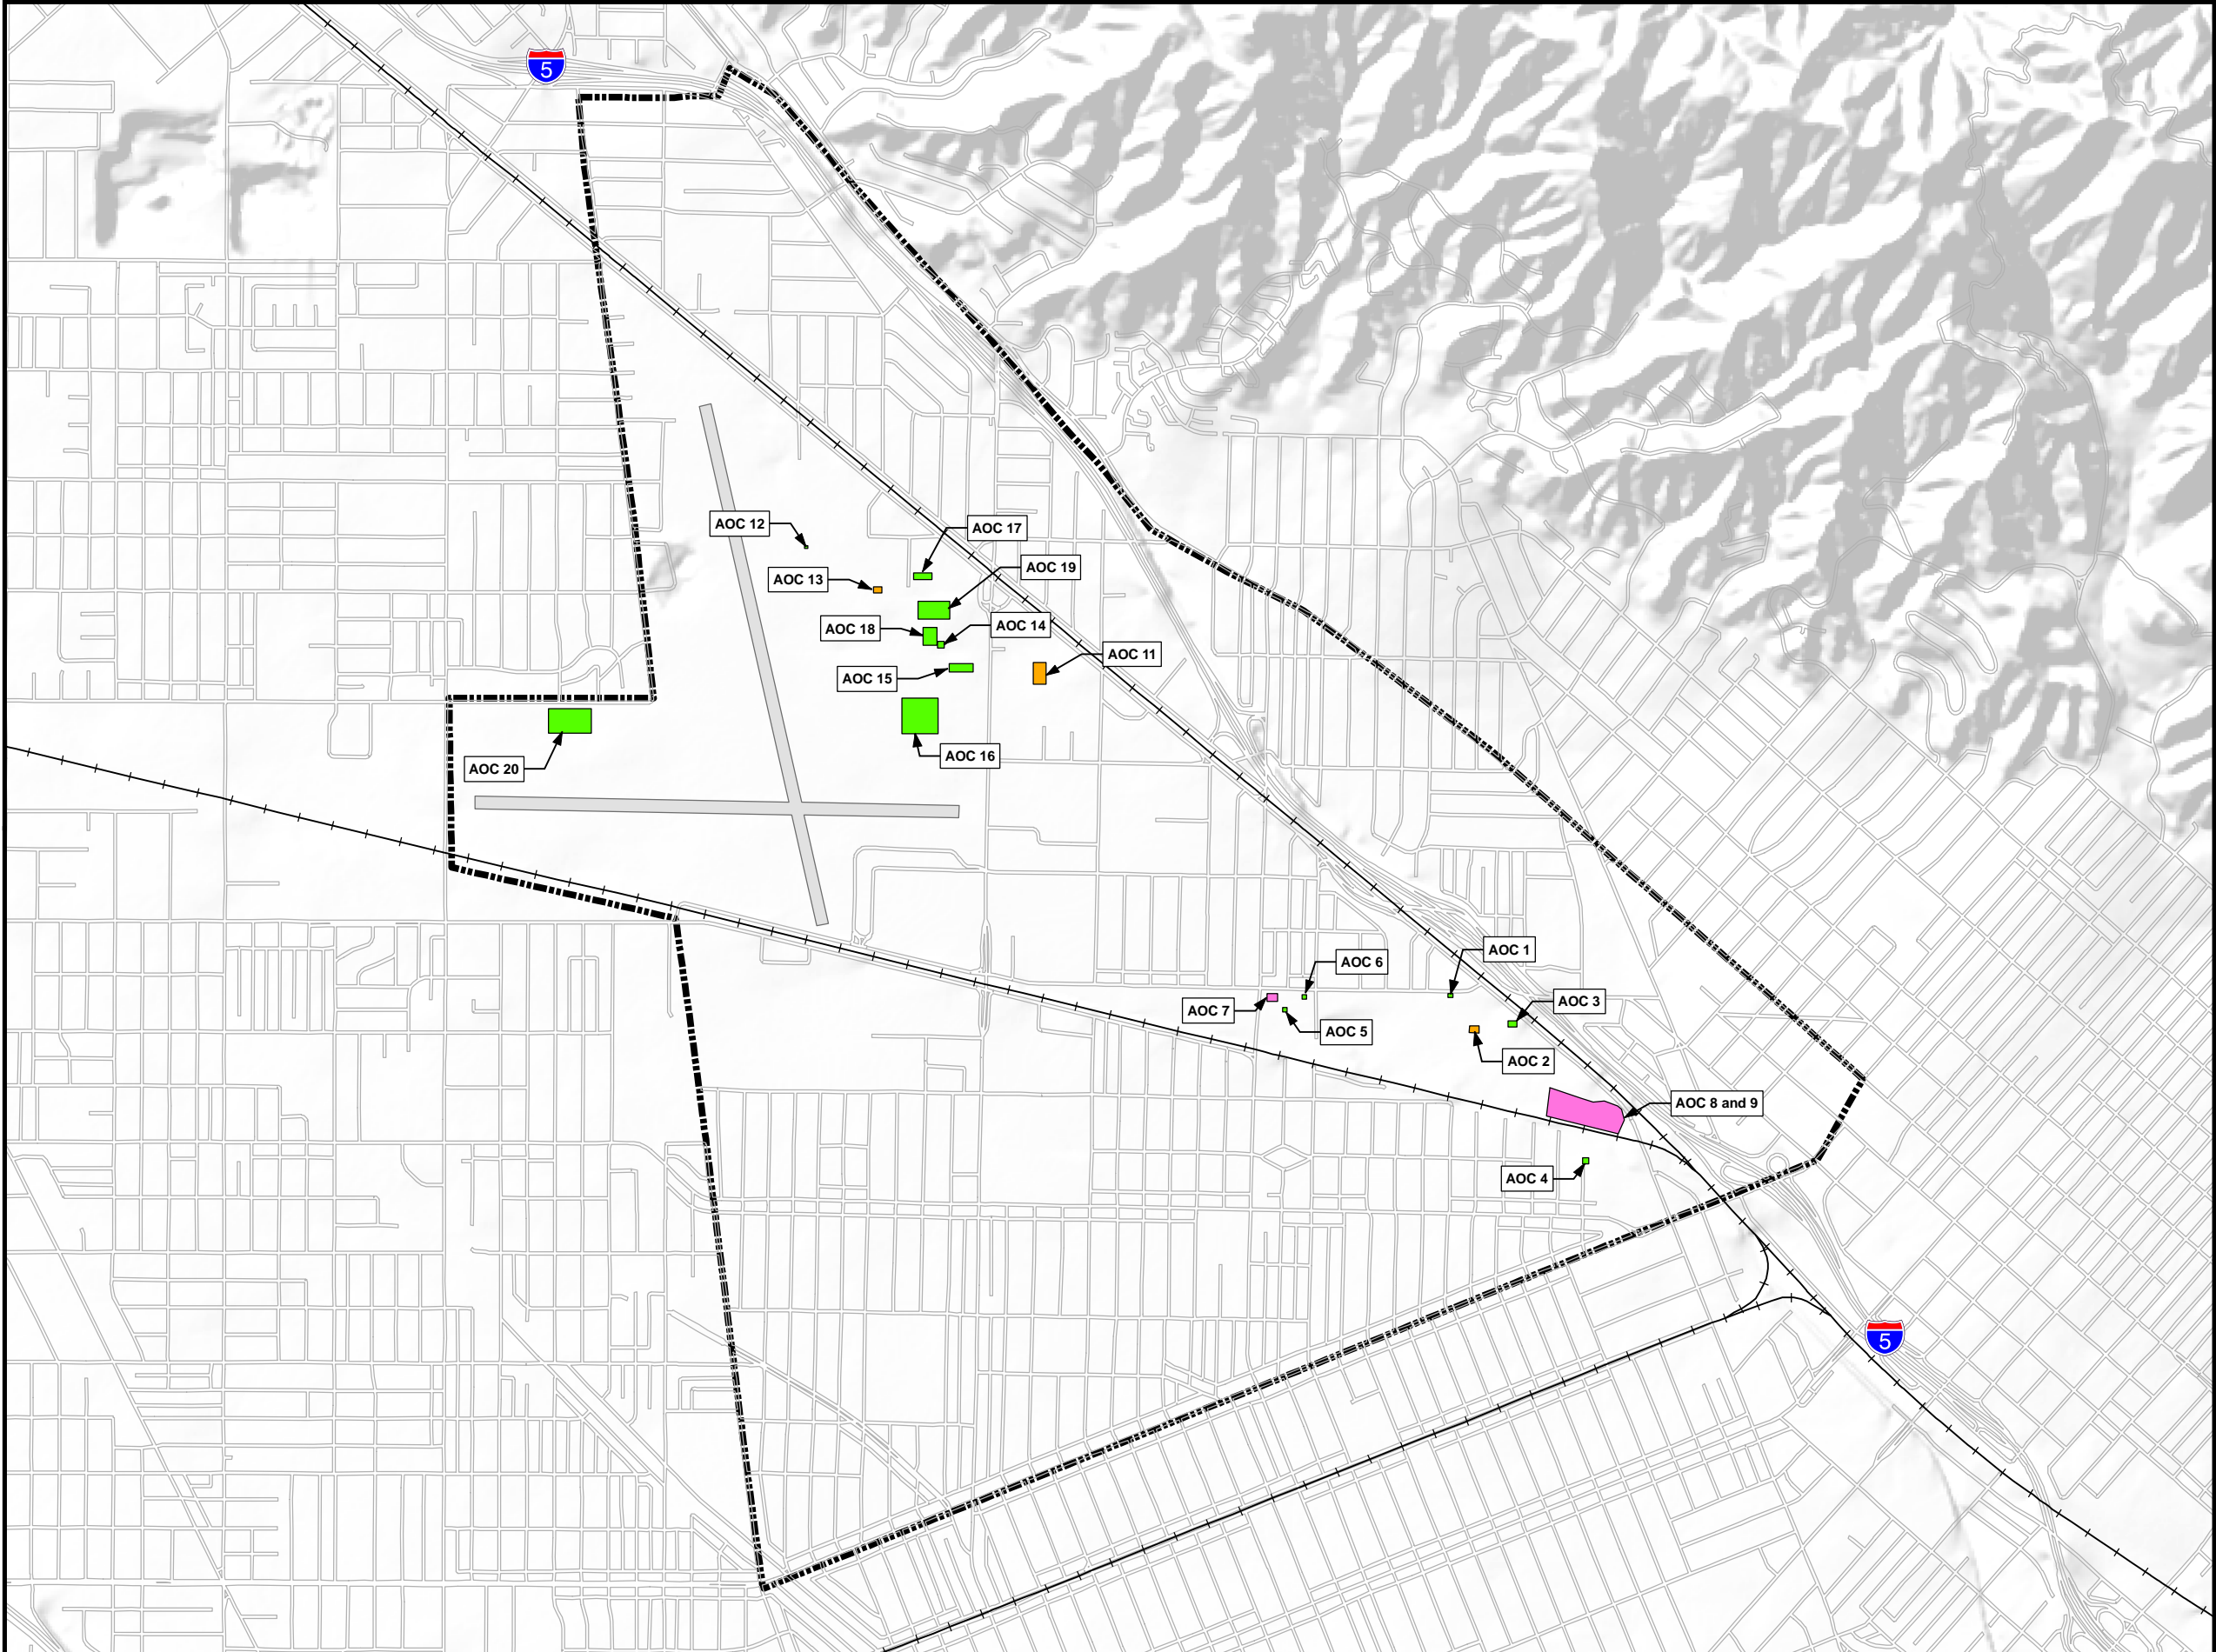

practices are expected to have reduced the potential for continued migration of the hexavalent chromium toward the water table.

- AOC 7 is upgradient of the BOU groundwater extraction and treatment system and based on capture zone analysis performed as part of the BOU semiannual groundwater monitoring program (Tetra Tech, 2014b), the AOC falls with the capture zone of the extraction system. Based on the capture zone analysis any impacted groundwater associated with this feature is presently captured.

AOCs 8 and 9

- AOCs 8 and 9 include the former buried waste area in the southeast corner of the former Plant B-1. During the demolition of buildings in the vicinity buried waste was discovered and excavated to depths as great as 23 feet bgs.
- Hexavalent chromium was detected in AOCs 8 and 9 during this investigation from 5 feet bgs to total depth at 60 feet bgs. The delineation of hexavalent chromium detected at AOCs 8 and 9 is not complete, and additional investigation may be warranted.
- The analytical results indicate that the hexavalent chromium mass presently in the vadose zone at one or more borings in AOCs 8 and 9 likely exceeds the AHCAC of the natural soil, potentially allowing the migration of hexavalent chromium if infiltration occurs. The former buried waste area is presently paved with asphalt-concrete, however, and the potential for remobilization of hexavalent chromium at depth in the vadose zone is reduced from the prior usage of this area.
- AOCs 8 and 9 are adjacent to the BOU groundwater extraction and treatment system and based on capture zone analysis performed as part of the BOU semiannual groundwater monitoring program (Tetra Tech, 2014b), the AOC falls with the capture zone of the extraction system. Based on the capture zone analysis any potentially impacted groundwater that is associated with this feature is presently captured.

Lockheed Martin will discuss the need for additional soil and/or groundwater delineation efforts following the Regional Board assessment of the data and findings presented in this report. Future site characterization activities will then be described in work planning documents prepared for Regional Board review.

-  Railroad
-  Burbank Operable Unit Boundary
-  Areas of concern in which hexavalent chromium was not detected in soil and there are no apparent hexavalent chromium threats to groundwater
-  Areas of concern in which low levels of hexavalent chromium were detected in soil but there are no apparent hexavalent chromium threats to groundwater due to the attenuation capacity of the soil
-  Areas of concern in which hexavalent chromium was detected in soil and there are potential hexavalent chromium threats to groundwater

BURBANK OPERABLE UNIT

ES-1
Potential Hexavalent Chromium Threats to Groundwater

Section 1 INTRODUCTION

On behalf of Lockheed Martin Corporation (Lockheed Martin), Tetra Tech has prepared this report summarizing the additional investigation of selected features at the former Lockheed Martin Burbank facilities (the site). The site (Figure 1) is located within the Burbank Operable Unit (BOU) of the San Fernando Valley Superfund Area 1, and includes specific areas of concern (AOCs) identified by the Regional Water Quality Control Board, Los Angeles (Regional Board) within former Plants A-1 North, B-1, B-6, and C-1.

1.1 REGIONAL WATER QUALITY CONTROL BOARD ORDER

The investigation activities at the site were performed pursuant to California Water Code Section 13267 Order No. R4-2013-0063 (the Order), issued to Lockheed Martin on 18 April 2013 by the Regional Board. The Order required Lockheed Martin to submit an Investigation Work Plan to delineate the extent of certain waste constituents, specifically volatile organic compounds (VOCs) and hexavalent chromium, in the subsurface soil and groundwater that may have originated from the former Lockheed Martin facilities specified in the Order. The Order identified between one and five specific features located at 20 AOCs. All of the AOCs were to be investigated for hexavalent chromium and eight of the AOCs were to be investigated for VOCs.

Lockheed Martin met with the Regional Board on 02 May 2013 to discuss the scope of the Order, and again on 25 June 2013 to review data compiled for each AOC and to discuss investigation approaches. In compliance with an approved extension request, Lockheed Martin submitted a draft work plan to the Regional Board on 13 August 2013. Lockheed Martin subsequently met with the Regional Board on 19 September 2013, at which time the Regional Board provided draft comments to the draft work plan; the draft comments included abeyance of the requirement to investigate AOC 10 (located at the former Plant A-1 North). The Regional Board provided final comments on 29 October 2013 and required Lockheed Martin to submit a revised investigation approach by 15 January 2014. Lockheed Martin met with the Regional Board again on 06 December 2013 to discuss the revised investigation approach presented in the updated version of the document.

1.2 REVISED WORK PLAN

Lockheed Martin submitted the *Revised Additional Site Investigation Work Plan, Former Burbank Plants A-1 North, B-1, B-6, and C-1, Burbank, California* (Tetra Tech, 2014a) on 15 January 2014. The work plan was conditionally approved by the Regional Board in a letter dated 25 March 2014. Conditions of the approval included the following:

- Install one soil boring at AOC 2 (Plant B-1 Dry Wells DW-2 and DW-2A) instead of two. The boring should be installed between the two former dry wells. The boring should be converted to a groundwater monitoring well.
- Install soil-vapor probes at AOC 5 (Plant B-1 Seepage Pit DW-4) at depth intervals determined by field conditions, rather than predetermined depths of 10, 20, and 30 feet.
- Convert one of the soil borings in AOC 7 (Plant B-1 Building 175 Vapor Degreaser and Clarifier) to a groundwater monitoring well.
- Sample groundwater monitoring wells installed at AOC 2 and AOC 7 consistent with the requirements established in the BOU groundwater monitoring program.
- Notify the Regional Board at least seven days prior to starting field activities.
- Perform the site investigation and submit a Site Investigation Report to the Regional Board by 25 September 2014.

Lockheed Martin subsequently submitted a letter on 24 June 2014 requesting modification of several work plan requirements including the following:

- Additional time (90 days) to perform the investigation and submit the Site Investigation Report.
- Abeyance of the requirement to install groundwater monitoring wells at AOC 2 and AOC 7 until after soil data have been evaluated.
- Removal of the requirement to present groundwater plume maps for 1,4-dioxane and n-nitrosodimethylamine at the site.
- Inclusion of a vertical profile for each AOC rather than cross sections.

The Regional Board approved all requested modifications except the last one in a letter dated 03 July 2014. Per the Regional Board, the Site Investigation Report will include one cross section per AOC. Additionally, the Regional Board extended the due date for the report to 29 December 2014.

1.3 OBJECTIVES AND TECHNICAL APPROACH

The objectives of this investigation are to delineate the extent of certain waste constituents originating from the AOCs identified in the Order and determine if the waste constituents pose a threat to groundwater. The technical approach used to achieve these objectives includes the following:

- Drill 30 soil borings to depths of 60 to 150 feet below ground surface (bgs) as specified in the Order.
- Collect soil samples for analysis of total chromium and hexavalent chromium
- Collect soil samples for analysis of VOCs if the VOC field screening criteria established in the work plan are exceeded.
- Install soil-gas probes in borings where VOCs exceed field screening criteria established in the work plan.
- Collect soil-gas samples for analysis of VOCs if soil-gas probes are installed.
- Perform hexavalent chromium and VOC attenuation assessments to determine the likelihood of existing hexavalent chromium or VOCs reaching the water table.

The additional data obtained during this investigation, together with the existing information and data, will be used to evaluate potential groundwater well locations and characterize the potential for groundwater impacts originating from the features identified in the Order and work plan.

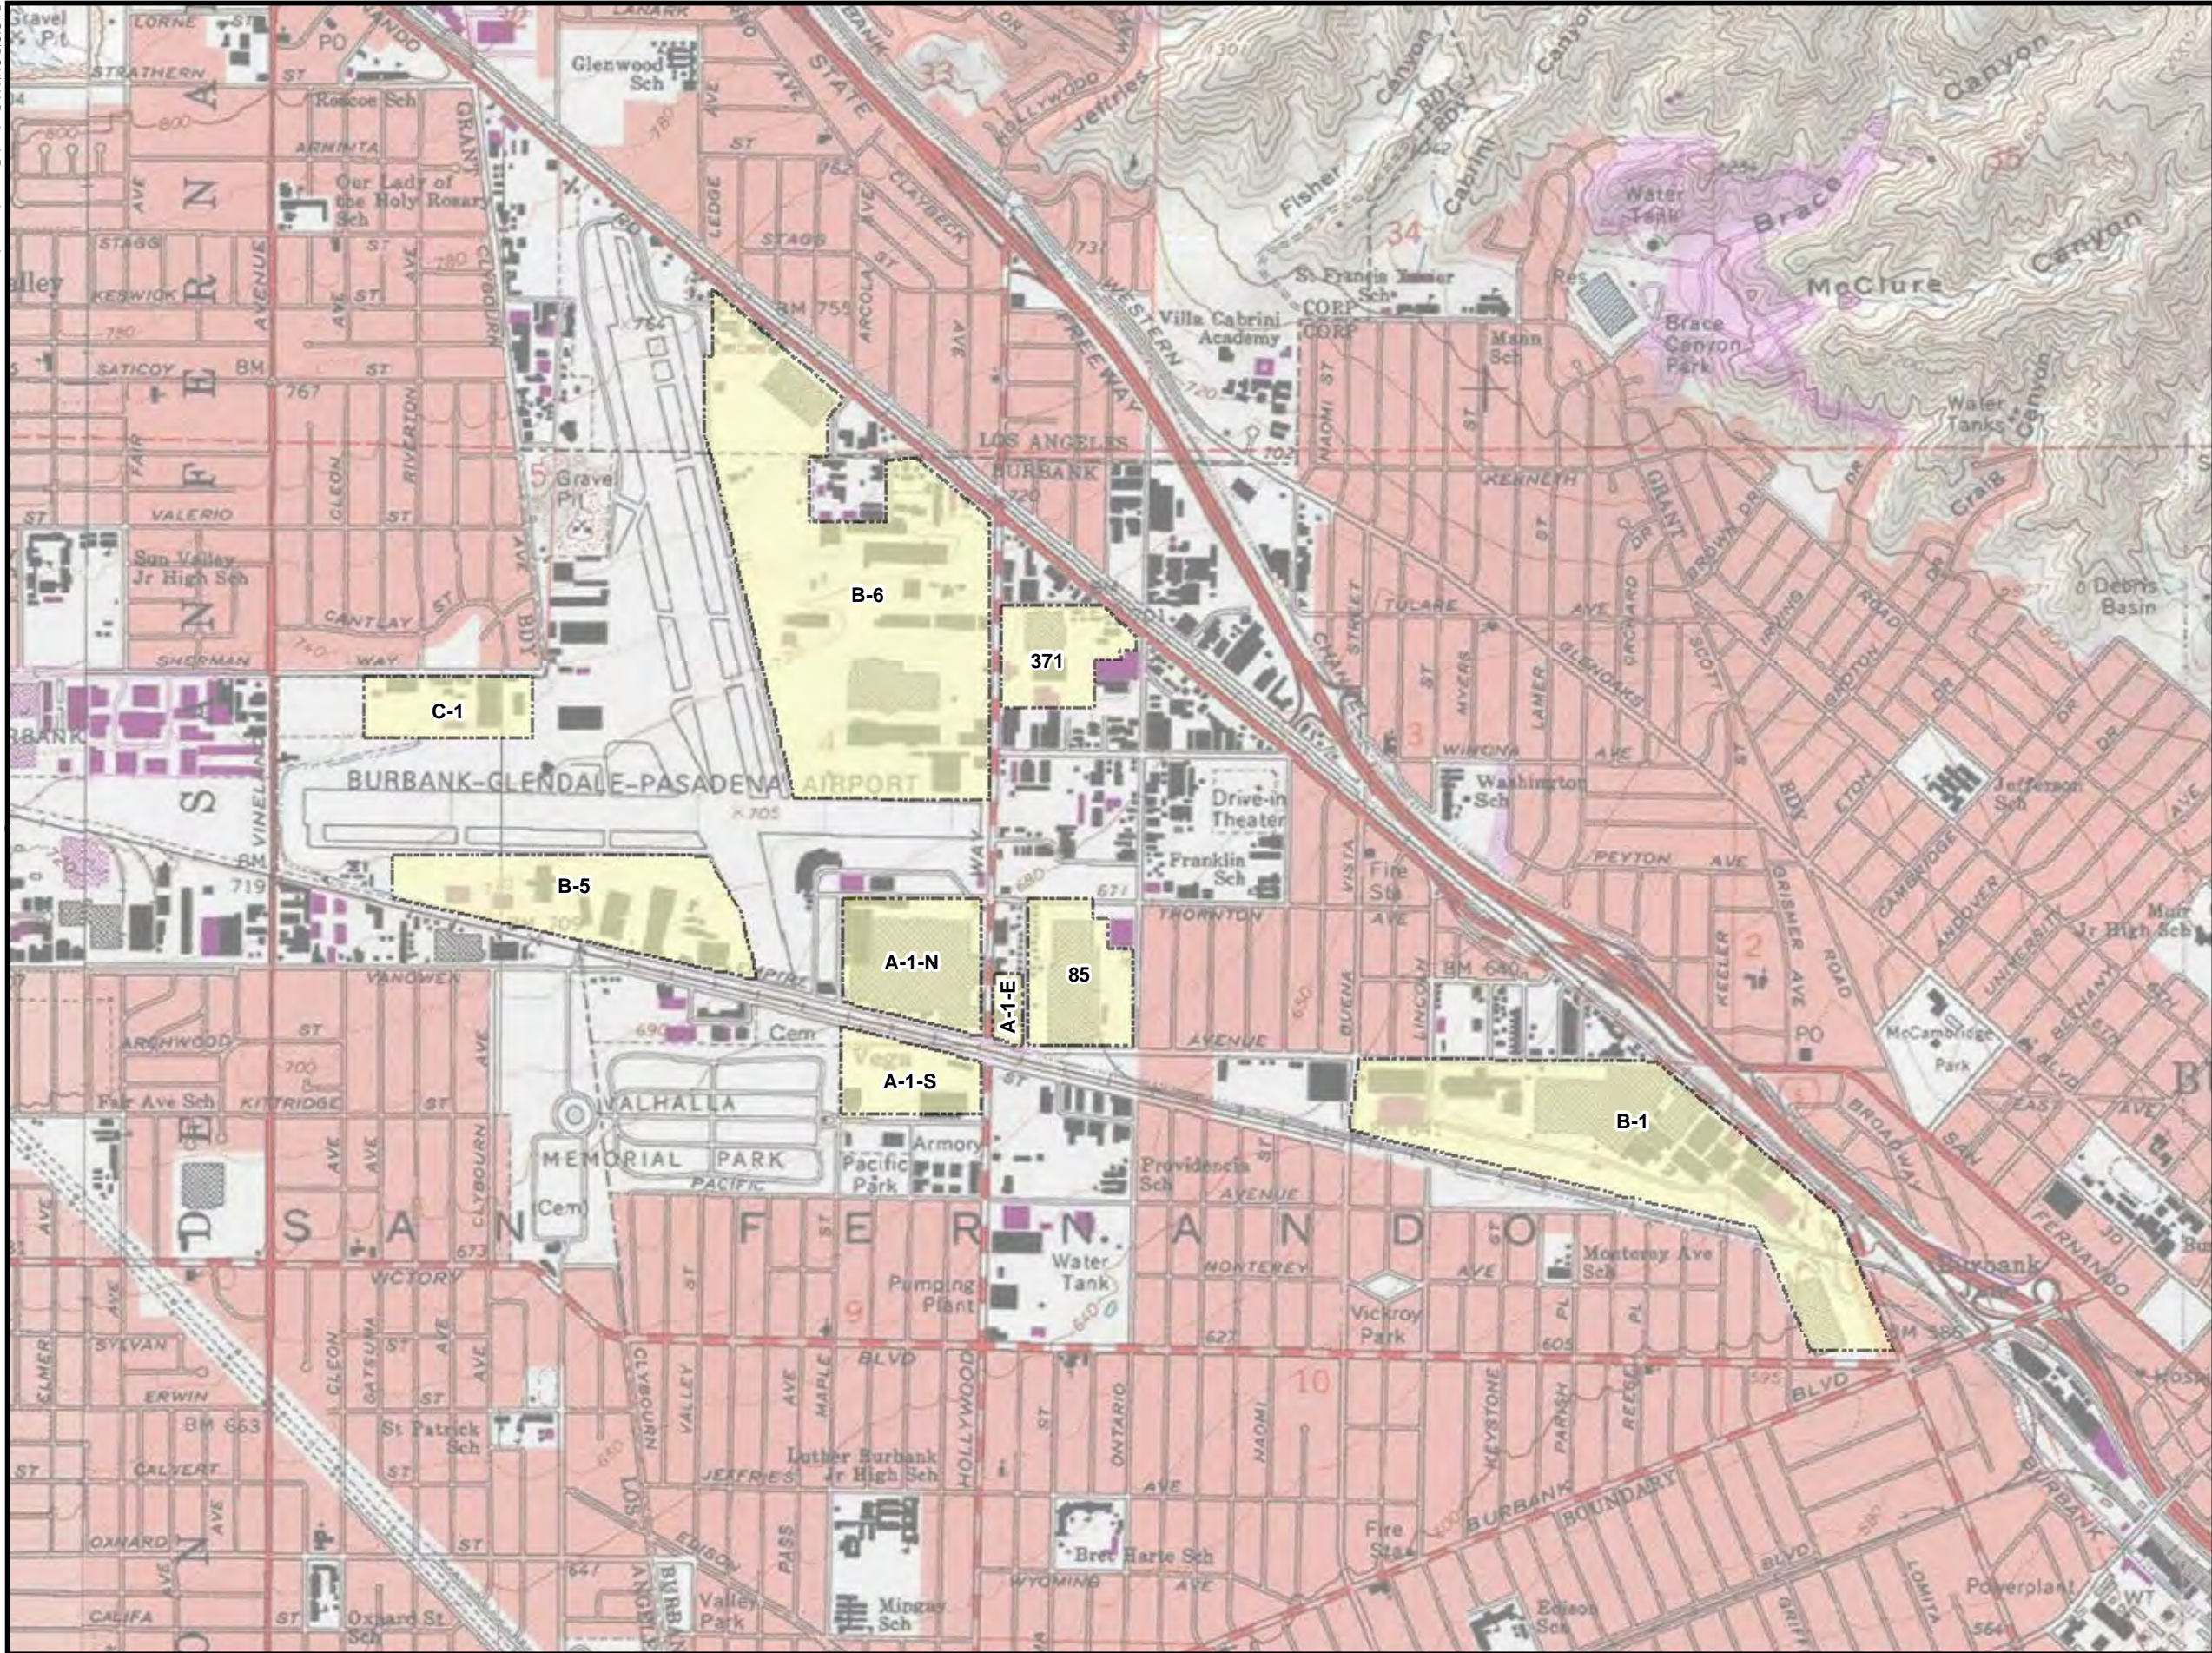

1.4 REPORT ORGANIZATION

This report is organized into the following sections:

- Section 1 – Introduction: This section presents the purpose and objectives of the site soil and soil-gas investigation activities and provides a brief description of the report organization.
- Section 2 – Background: This section provides the site history for the various former Lockheed Martin plants, the physical setting for the site, and a generalized description of site geology and hydrogeology, regional geology and hydrogeology, and groundwater quality.
- Section 3 – Methodology: This section provides a description of the field investigation, including pre-drilling activities, soil sampling and analysis, deviations from the work plan, equipment decontamination, surveying, and waste management.
- Section 4 – Analytical Results: This section provides a summary of soil analytical results and data quality assessment.

-
- Section 5 – Hexavalent Chromium Evaluation: This section provides an interpretation of analytical results, including hexavalent chromium attenuation evaluations.
 - Section 6 – Conceptual Site Models: This section provides a summary of the conceptual site model (CSM) for each AOC. The CSM includes a brief description of the AOC, the local geologic and hydrogeologic conditions, the results from this investigation, an evaluation of the adequacy of delineation, and an assessment of the potential for the use of the feature to have resulted in impacts to groundwater.
 - Section 7 – Conclusions and Recommendations: This section provides conclusions based on the investigation results and the data evaluation and recommendations for potential additional investigation activities.
 - Section 8 – References: This section provides a list of documents referenced in this report.

Site Location Map

Section 2 BACKGROUND

This section provides the history, physical setting, geology, and hydrogeology for the selected features within the former Lockheed Martin Burbank facilities (the site) requiring additional investigation. The geologic and hydrogeologic conditions at the site are based on the current investigation and previous investigations at the site.

2.1 SITE HISTORY

A brief history of the former Lockheed Martin Corporation (Lockheed Martin) plants that comprise the site is provided below.

2.1.1 Plant B-1

Former Plant B-1 occupied approximately 100 acres located southeast of the Bob Hope Airport (Figure 1). Former Plant B-1 was in use by Lockheed Martin between 1928 and 1991 with operations specific to completed parts fabrication and subassembly, including tooling, parts shaping and machining, plating, deburring, cleaning, and painting. The chemicals and materials used, stored, or generated at the former Plant B-1 included gasoline and diesel fuels, oils, solvents, paints, acids, caustic solutions, chromic acid, boiler blowdown, and metal shavings.

Over 100 environmental investigations and assessments have been conducted at former Plant B-1. These investigations included environmental site assessments, UST leak detection programs, and soil, soil-vapor, and groundwater investigations. The overall purpose of these investigations was to characterize and delineate the extent of targeted chemicals at all of the various features of environmental concern. These chemicals primarily included VOCs and metals (including chromium and hexavalent chromium). These investigations and assessments resulted in over 500 soil borings or sample locations, with over 4,000 samples collected and analyzed for VOCs and metals.

Various remedial activities have taken place at former Plant B-1 based on the aforementioned investigations and assessments. These include the AquaDetox system (a combined SVE and groundwater pump-and-treat system) installed and operated at Buildings 175/180 from 1988 to

1994, UST removals and closures, demolition and removal of other subsurface features of concern, soil excavations within the former buried debris area, and the currently active SVE system located in the central area of the former B-1 Plant which has been operational since July 1997. From these remedial actions, the Regional Board has issued six “No Further Requirements” letters including one that noted no further requirements for the site except for the active SVE system.

2.1.2 Plant B-6

Former Plant B-6 occupied approximately 132 acres located in the northeast quadrant of the Bob Hope Airport, south of San Fernando Road and west of Hollywood Way (Figure 1). Over 80 buildings were constructed on the site during Lockheed Martin’s occupation from 1941 to 1997. The property was acquired by the Burbank-Glendale-Pasadena Airport Authority (Airport Authority) in 1997 under eminent domain. Operations at the former Plant B-6 included aircraft parking, final assembly and flight support, classified aircraft research and development, minor subassembly work, aircraft functional testing, and ground support. Supporting activities included cleaning and painting, minor tooling, welding, and parts and components machining. Chemicals and materials used and/or stored at the site to support these operations included aircraft fuels, biocides, descalers, fuel oils and gasoline, paints, solvents, acids, caustics, and plastic resins and hardeners. Fuels used at the site included automobile gasoline, aviation gasoline, Jet A, JP-4, JP-5, JP-7, JP-8, and other thermally stable jet fuels. Types of oils used included conventional motor oils, turbine lubricating oils, hydraulic system oils, and rust preventative oils.

Over 25 environmental investigations and assessments have been conducted at the former Plant B-6 that identified various features of environmental concern. These investigations and assessments resulted in 295 borings and sample locations were identified, and 891 samples were collected and analyzed for metals (including total chromium and hexavalent chromium).

Based on the data gathered from the aforementioned investigations and assessments, various remedial activities took place at former Plant B-6 prior to the Airport Authority’s acquisition of the property. These remedial activities included UST removals and closures, and demolition and removal of other subsurface features of concern. From these remedial actions, the Regional Board has issued 11 “No Further Requirements” letters for former Plant B-6.

2.1.3 Plant C-1

Former Plant C-1 occupied approximately 20 acres located in the northwest quadrant of the Bob Hope Airport, south of Sherman Way (Figure 1). Operations at the facility were conducted from the early 1940s through 1990. The property was sold to the Airport Authority in 1997. Operations at the former Plant C-1 included classified aircraft research, milling and machining of metal parts, and aircraft maintenance and modification. Chemicals and materials used, stored, or generated at the site to support site operations included diesel fuel, biocides, motor oil, hydraulic oil, waste oil, metal chips, cooling and cutting oil, biocides, descalers, lubricants, and solvents.

Over 30 environmental investigations and assessments have been conducted at the former Plant C-1 to identify various features of environmental concern. From these investigations and assessments, 93 borings and sample locations were identified, and 260 samples collected and analyzed for metals (including total chromium and hexavalent chromium).

Various remedial activities have taken place at former Plant C-1 based on the data gathered from the aforementioned investigations and assessments. These remedial activities included UST removals and closures, and demolition and removal of other subsurface features of concern. From these remedial actions, the Regional Board issued two “No Further Requirements” letters for former Plant C-1.

2.2 PHYSICAL SETTING

The site is located in the southeastern portion of the San Fernando Valley (SFV) in the Burbank Operable Unit (BOU) Superfund Area 1, within the City of Burbank, California (Figure 2). The SFV is a 260-square-mile basin bounded to the south by the Santa Monica Mountains, to the west by the Simi Hills, to the north by the Santa Susana and San Gabriel Mountains, and to the east-northeast by the Verdugo and San Gabriel Mountains.

2.3 REGIONAL GEOLOGY AND HYDROGEOLOGY

2.3.1 Regional Geology

The geology of the SFV increases in complexity with depth (a result of the tectonic forces native to the region). The stratigraphy of the SFV area, from youngest to oldest, consists of: alluvial deposits (younger Holocene transitioning into older Pleistocene) overlying unconsolidated

Pliocene-Pleistocene bedrock of marine and non-marine origin, overlying Tertiary marine sandstone, mudstone, and shale bedrock, overlying Mesozoic- and older-age crystalline and metamorphic basement complex rocks. The simplified stratigraphic column for the SFV (in the vicinity of the site) is presented below.

Alluvium	Younger
	Older
Unconsolidated bedrock of marine and non-marine origin	Non-marine
	Marine
Marine sandstone, mudstone, and shale bedrock	Sandstone Mudstone/shale
Basement complex bedrock	Igneous and metamorphic rocks

The bedrock units crop out in the surrounding hills and mountains that form the valley boundaries. The eastern margin of the valley is bounded by the plutonic and metamorphic rocks of the Verdugo Mountains. The northern margin of the valley is bounded by the sedimentary rocks of the Santa Susana Mountains and the plutonic and metamorphic rocks of the San Gabriel Mountains. The western edge of the valley is defined by the Simi Hills where sedimentary rock is exposed. The southern margin is defined by the Santa Monica Mountains where sedimentary and igneous rocks are exposed.

The Quaternary alluvium beneath the site consists of Holocene younger alluvium and Pleistocene older alluvium. The younger alluvium extends from the ground surface to approximately 410 feet bgs or more, and the older alluvium extends from the base of the younger alluvium to 1,200 feet bgs or more. The contact between the younger and older alluvium has been reported to be marked by a distinct basal cobble layer (HSI Geotrans, 1997).

The younger alluvium consists of coarse-grained sand, gravel, and cobbles interbedded with finer-grained units of sand, silty sand, sandy silt, silt, and clay. The units generally vary in elevation and thickness; the contacts between the units have a northeast-trending strike and dip towards the southeast. The composition of the upper portion of the older alluvium varies from sand, gravel, and boulders near former Plant C-1 to interbedded silt and sand in the vicinity of former Plants B-1 and

B-6. The deeper portion of the older alluvium consists of silt and sand with interbedded gravel (HSI Geotrans, 1997).

The northwest-trending Verdugo fault zone is located east of the site. The fault zone has been interpreted as a low-permeability zone that can both impede and direct the flow of groundwater.

2.3.2 Regional Hydrogeology

The site is located in the San Fernando Valley Groundwater Basin, which is comprised of water-bearing alluvium that overlies a non-water-bearing bedrock complex of older sedimentary rock formations and crystalline and metamorphic basement complex rock. Groundwater enters the basin by infiltration of surface-water runoff from the highlands, by deep penetration of rain on the valley floor, and by artificial means such as irrigation return or induced recharge. Outflow of groundwater from the basin is through groundwater extraction and a small amount of flow (surface and groundwater) through the Los Angeles Narrows (southeast of the BOU). Groundwater in the eastern portion of the basin flows mainly through two sedimentary units: the Pleistocene older alluvium and the Holocene younger alluvium. The aquifer in the older alluvium has been observed to be locally semi-confined to confined by clay and silt units, whereas the aquifer in the younger alluvium is generally unconfined to semi-confined depending upon the location and thickness of the fine-grained units (HSI Geotrans, 1997).

The aquifer in the younger alluvium at the site has been divided into five hydrostratigraphic units (HSUs) based on electrical resistivity responses in geophysical logs (Hargis + Associates, 1991; Simon Hydro Search, 1993). The five HSUs of the younger alluvium are identified from upper to lower as A', X, A, Y, and B. The A', A, and B HSUs are generally composed of coarser-grained material (coarse-grained sand, gravel, and cobbles). The X and Y HSUs separate the coarser-grained HSUs and consist of relatively finer-grained material (sand, silty sand, and silt). Based on the stratigraphic position of the units, the groundwater gradient, and overall groundwater levels, the A' HSU, the X HSU, or the A HSU may locally represent water table (WT) conditions depending on geographic location within the project area. These HSUs are collectively referred to as WT HSUs.

2.4 SITE GEOLOGY AND HYDROGEOLOGY

2.4.1 Site Geology

The site soils that were encountered in the current investigation above the water table consist of compacted fill (generally 0 to 10 feet bgs), but may be deeper and may not be present at all areas of concern (AOCs) underlain by younger alluvium. The younger alluvium is generally coarse-grained (sand, sand with gravel, and sandy gravel), with local finer-grained interbeds (silty sand, sandy silt, and sandy clay). The specific locations of fine-grained interbeds generally vary from one AOC to another.

2.4.2 Site Hydrogeology

Shallow groundwater currently flows to the site from the west, north, and east. The local groundwater flow direction at the site is predominantly southeasterly, converging in a flow direction toward the depression in the WT created by the operation of the extraction wells along Vanowen Street and in the southern portion of former Plant B-1. Groundwater-elevation data indicate that the dominant direction of groundwater flow immediately south of former Plant B-1 is generally reversed from its natural southeasterly flow direction, as it follows a northerly flow direction into the depression in the WT created by the operation of the BOU extraction wells.

Based on groundwater data from April 2014, approximate groundwater depths for the site vary by location, as listed below (Tetra Tech, 2014b).

- Plant B-1: Groundwater is approximately 135 to 175 feet bgs.
- Plant B-6: Groundwater is approximately 220 to 250 feet bgs.
- Plant C-1: Groundwater is approximately 235 to 240 feet bgs.

The April 2014 groundwater elevation contours for shallow groundwater monitoring wells from the most recent groundwater monitoring report (Tetra Tech, 2014b) are presented on Figure 3. The 20 AOCs for this investigation are shown on these maps for reference.

2.5 GROUNDWATER QUALITY

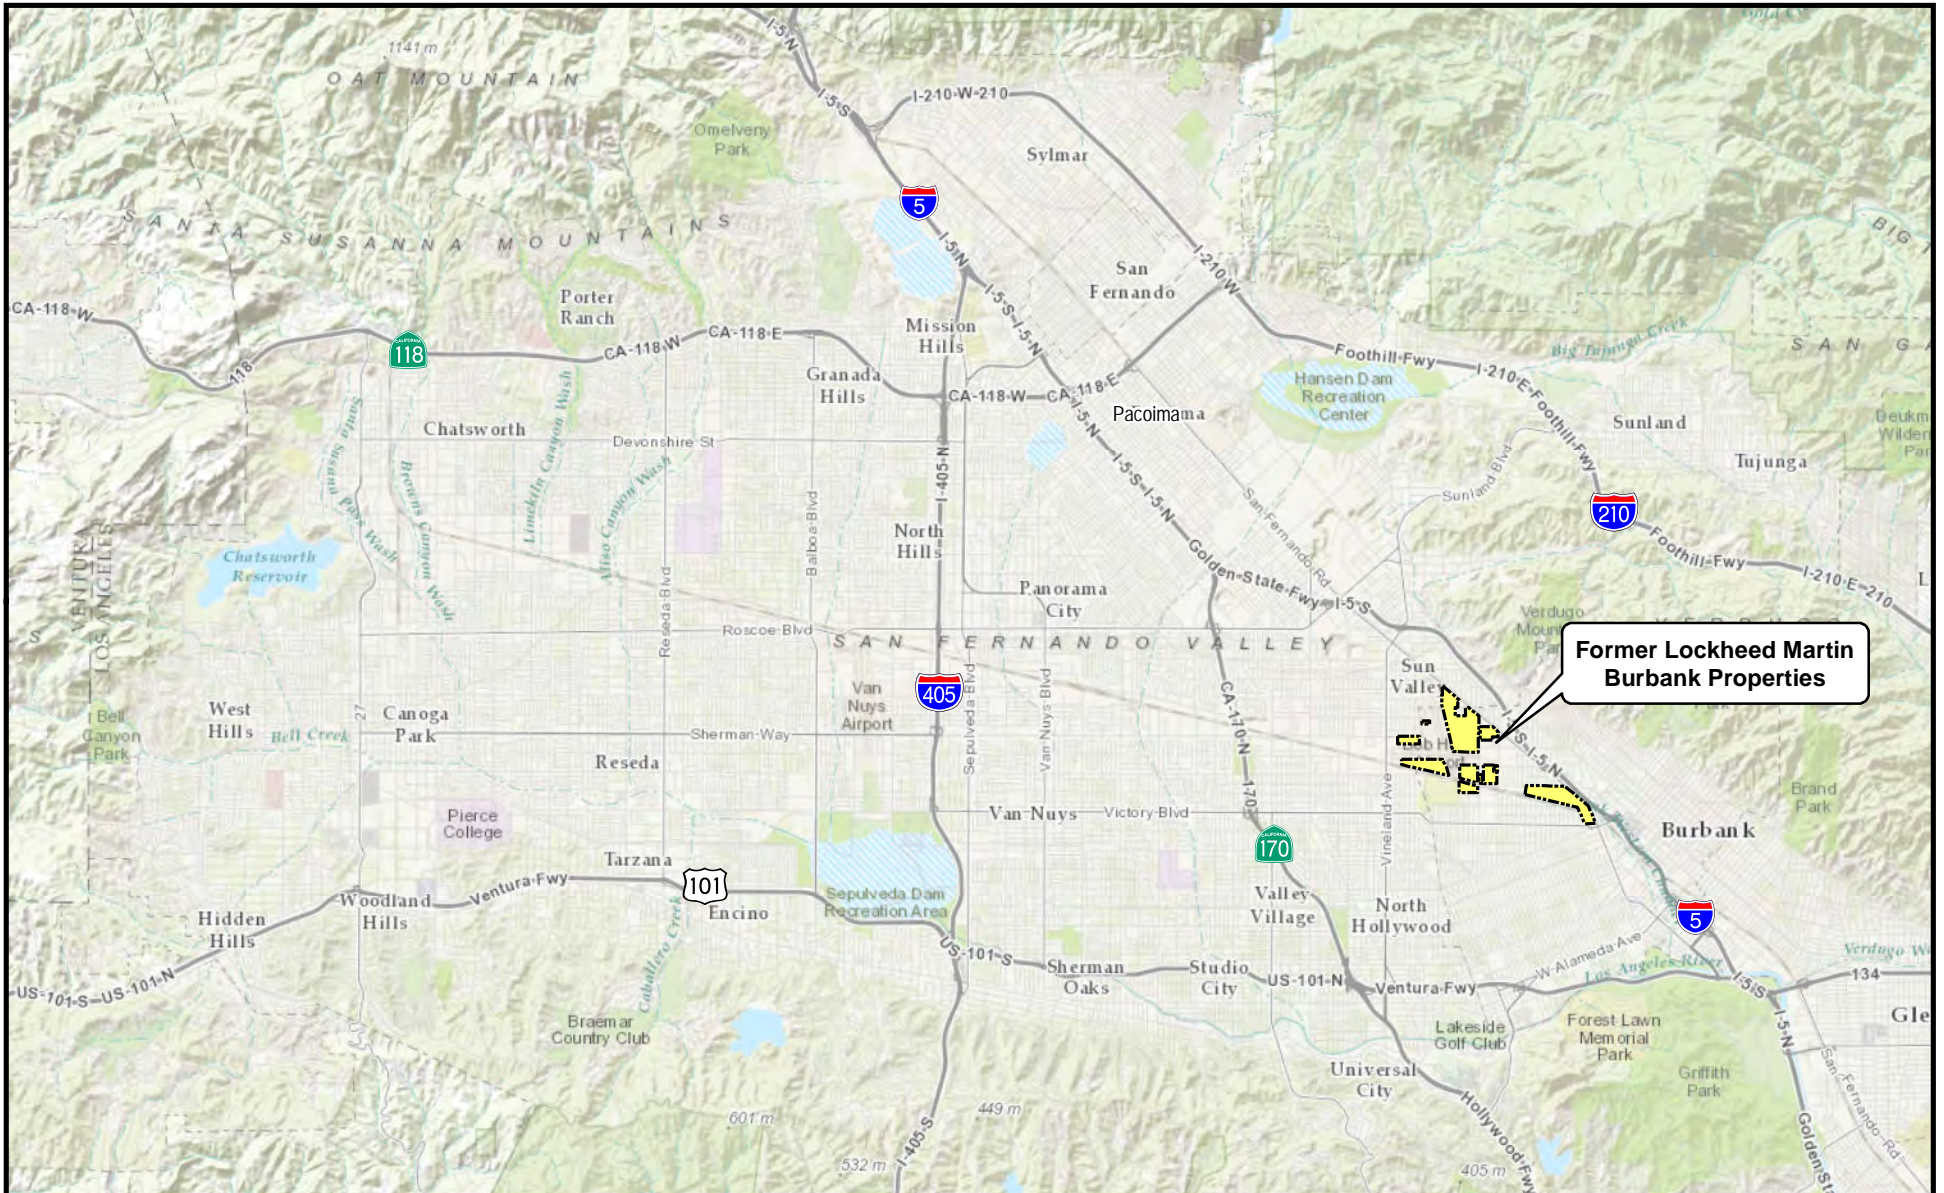

Lockheed Martin has monitored groundwater quality at the BOU (within which the site is located) since 1986. In order to address VOCs in groundwater, a groundwater extraction system and treatment plant were constructed in 1994 and began operation in 1996. Current system operations

include pumping groundwater from as many as eight extraction wells, and sequential treatment by air stripping and aqueous-phase granular activated carbon. Off-gassed VOCs from the air stripper are treated with vapor-phase activated carbon.

The distribution of VOCs has been well defined in the BOU monitoring area. The primary VOCs of concern that were identified in the BOU are tetrachloroethene (PCE) and trichloroethene (TCE). The concentrations of TCE, PCE, total chromium, and hexavalent chromium in shallow groundwater have generally decreased or remained stable since data were first collected (Arcadis, 2012). Additionally, analytical results from well clusters have shown that TCE, PCE, total chromium, and hexavalent chromium concentrations in wells screened in the lower HSUs are generally much lower than in the shallow wells.

The April 2014 isoconcentration maps for PCE, TCE, total chromium, and hexavalent chromium in shallow groundwater monitoring wells from the most recent groundwater monitoring report are presented on Figures 4, 5, 6, and 7, respectively (Tetra Tech, 2014b). The 20 AOCs for this investigation are shown on these maps for reference.

Section 3

METHODOLOGY

This section describes the field investigation and data collection methods. Work was performed in conformance with the *Revised Additional Site Investigation Work Plan, Former Burbank Plants A-1 North, B-1, B-6, and C-1, Burbank, California* (Tetra Tech, 2014a) unless noted otherwise.

3.1 PRE-DRILLING ACTIVITIES

Pre-drilling activities for the investigation included preparing investigation support documents, obtaining permits for the field investigation, and conducting underground utility clearance.

3.1.1 Investigation Support Documents

The following documents were prepared by Tetra Tech for Lockheed Martin Corporation (Lockheed Martin) to support the investigation.

- *Revised Site-Specific Health and Safety Plan* (Tetra Tech, 2014c)
- *Draft Project Quality Management Plan, Revised* (Tetra Tech, 2014d)
- *Quality Assurance Project Plan (QAPP)* (Tetra Tech, 2014e)
- *Draft Field Activity Sequencing Plan* (Tetra Tech, 2014f)
- *Waste Management Plan* (Tetra Tech, 2014g)
- *Traffic Control Plan* (Tetra Tech, 2014h)

3.1.2 Permitting

In compliance with a request made by the Burbank-Glendale-Pasadena Airport Authority, Federal Aviation Administration (FAA) Forms 7460-1 were filed for all boring locations located within areas of concern (AOCs) on Bob Hope Airport property (AOC 12 through AOC 20). The FAA did not object to the proposed drilling activities. A copy of the FAA determination letter is provided in Appendix A.

3.1.3 Utility Clearance

All soil boring locations were cleared for underground utilities prior to drilling in accordance with Lockheed Martin's "Minimum Requirements for Intrusive Fieldwork Work Plans" (2011). Utility clearance activities included the following:

- Reviewing any available utility maps that were provided.
- Performing a utility clearance geophysical survey for the soil boring locations. The utility clearance was performed by Terra Physics using radio, electromagnetic instruments, and ground penetrating radar.
- Marking the areas of the site where intrusive field work was to be performed, and notifying Underground Services Alert for utility clearance at least 48 hours prior to the start of intrusive field work.

Several of the borings were located in the vicinity of active soil-vapor extraction (SVE) lines, and the precise location and depth of the lines could not be confirmed with certainty. Therefore, a vacuum truck was used to remove soil at these locations to depths from 8 feet below ground surface (bgs) to 14 feet bgs to confirm the absence of the SVE lines at borings AOC2-1, AOC3-1, AOC8/9-4, AOC11-1, and AOC11-2.

3.2 SOIL SAMPLING AND ANALYSES

A total of 30 soil borings were drilled and sampled from 02 September 2014 to 06 November 2014 using a hollow-stem-auger (HSA) drill rig. Drilling was performed by National, a California C-57 licensed drilling contractor. Drilling was observed by a Tetra Tech representative under the direct supervision of a California-registered Professional Geologist. The boring locations are shown on Figure 8 (former Plant B-1) and Figure 9 (former Plants B-6 and C-1).

3.2.1 Drilling and Sampling Methodology

A coring attachment affixed to the HSA rig was used to remove asphalt-concrete, if present. Each boring not cleared with a vacuum truck was hand-augered in three locations oriented in a triangular pattern to depths of 5 feet bgs to confirm the absence of shallow underground utilities. The HSA rig was then used to drill the borings to the target depth using an 8-inch-diameter auger.

Soil samples were collected every 5 feet by driving an 18-inch-long, 2-inch-diameter California-drive split-spoon sampler into undisturbed soil. Blow counts for advancing the sampler were recorded on the boring logs (Appendix B). The split-spoon sampler was loaded with three 6-inch-

long, 2-inch-diameter, clean brass sample sleeves. Upon collection of the samples from the designated sampling interval, the sampler was brought to the surface, disassembled, and placed on plastic sheets according to the correct retrieval sequence. The bottom 6-inch sample sleeve was immediately sealed at both ends with Teflon™ film and plastic end caps, labeled, stored in a sealable bag, and placed into a cooler for transportation to the analytical laboratory. The information for each sample was recorded on a chain-of-custody form identifying former Lockheed Martin Burbank facilities (the site), date, time, sampler, sample container, and requested analyses.

A portion of the soil sample collected in the second sleeve was screened in the field using an organic vapor analyzer (OVA) equipped with a photo-ionization detector (PID) calibrated with 100 parts per million (ppm) isobutylene. The soil sample was placed in a plastic bag which was then sealed and the soil was disaggregated. The sealed bag was left for several minutes to allow organic vapors to volatilize before inserting the tip of the OVA into the bag to obtain a volatile organic compound (VOC) headspace reading.

The remainder of the soil sample from the second sleeve was utilized to log the soil. The borings were logged according to the Unified Soil Classification System (USCS) under the supervision of a California-registered Professional Geologist. Soil sample descriptions include observed grain size, gradation, percentage of soil fractions (i.e., clay, silt, sand, and gravel), hardness or density, and moisture content. The extent and nature of any staining and odors observed in the samples were recorded on the logs. Soil color was determined using the Munsell Soil Color Chart® and recorded on the logs. The soil sample descriptions, sampling depths, and the maximum PID readings are included on the boring logs (Appendix B).

In accordance with the *Revised Additional Site Investigation Work Plan, Former Lockheed Martin Plants A-1 North, B-1, B-6, and C-1, Burbank, California* (Tetra Tech, 2014a), duplicate samples were collected at a minimum frequency of 10% to assess sampling and analytical precision and reproducibility. Duplicate samples were collected by removing soil from a brass sleeve and placing the soil in a clean glass bowl. The soil was homogenized in the glass bowl, and placed in two 8-ounce glass jars (one for the primary sample and one for the duplicate sample).

To confirm proper decontamination between samples and determine if cross contamination of the environmental samples occurred during sampling, equipment blanks were collected on each

sampling day by each sampling team by rinsing distilled water over and through the sample shoe, and then collecting the water in appropriate sample containers.

3.2.2 Laboratory Analyses

3.2.2.1 Environmental Analyses

All soil samples for environmental analyses were delivered to American Environmental Testing Laboratory, Inc. (AETL), a California Department of Health Services-certified laboratory, under proper chain-of-custody records. Samples from the finest-grained unit encountered in each 10-foot interval were selected for the following analyses:

- Total chromium (United States Environmental Protection Agency [USEPA] Method SW3050B/6020A)
- Hexavalent chromium (USEPA Method SW3060A/7199)

The remaining samples were submitted to the laboratory and placed on hold.

3.2.2.2 Geochemical Analyses

Selected representative soil samples were analyzed for geochemical parameters by AETL. The geochemical parameters included the following:

- Total iron (USEPA Method SW3050B/6020A)
- Total manganese (USEPA Method SW3050B/6020A)
- Total sulfide (USEPA Method E376.2)
- Total organic carbon (USEPA Method SW9060/SW-846)
- pH (USEPA Method SW9045C)

3.2.2.3 Geotechnical Analyses

Selected soil samples were analyzed for physical properties by Environmental Geotechnical Laboratory, Inc. The physical properties included the following:

- Grain-size distribution (American Society for Testing and Materials [ASTM] D422)
- Dry bulk density (ASTM D2937)
- Total porosity (American Petroleum Institute [API] RP40)
- Moisture content (ASTM D2216)

3.2.2.4 Leachability Analyses

Selected soil samples were analyzed for leachability by AETL using a modified Synthetic Precipitation Leaching Procedure (SPLP) extraction with analysis of the leachate for hexavalent chromium, total chromium, and iron. The SPLP was modified as part of the investigation and is described in Appendix C.

The following analyses were performed on the leachate:

- Total chromium (USEPA Method SW6020A)
- Hexavalent chromium (USEPA Method SW7199)
- Total iron (USEPA Method SW6020A)
- pH (USEPA Method SW9040B)

3.2.2.5 Available Hexavalent Chromium Attenuation Capacity

Selected soil samples were analyzed to evaluate the attenuation capacity using an available hexavalent chromium attenuation capacity (AHCAC) analysis. The analyses were performed by AETL. The analysis is a variant of the “available chromium reducing capacity” test referenced in *Natural Attenuation of Hexavalent Chromium in Groundwater and Soils* (USEPA, 1994) and described in (Bartlett and James, 1988). The AHCAC analyses are described in detail in Appendix C.

3.3 VOLATILE ORGANIC COMPOUNDS

Per the *Revised Additional Site Investigation Work Plan, Former Lockheed Martin Plants A-1 North, B-1, B-6, and C-1, Burbank, California*, any soil samples in AOC 2, AOC 4, AOC 5, AOC 6, AOC 7, AOC 8/9, and AOC 11 with PID headspace readings exceeding 50 ppm would be analyzed for VOCs (maximum one per 10-foot interval) and soil-gas probes would be installed (maximum five per boring) and sampled (Tetra Tech, 2014a).

3.4 DEVIATIONS FROM THE WORK PLAN

Several borings were moved slightly from their original proposed locations to avoid underground utilities. All revised locations were approved by a representative of the Regional Water Quality Control Board (Regional Board). The most significant change was AOC3-1, which was moved 22 feet southeast due to the presence of multiple electric lines, fiber optic lines, SVE lines, streetlight

poles, crosswalk poles, and other unknown utility lines. The new location was approximately 15 feet from former seepage pit DW-3.

The work plan (Tetra Tech, 2014a) designated two borings within AOC 2 in accordance with the California Water Code Section 13267 Order No. R4-2013-0063 (the Order). However, the Regional Board revised the requirements for this location in a letter dated 25 March 2014. Only one boring was required between the two former dry wells. Therefore only one boring was drilled at AOC 2.

The boring in AOC 4 (AOC4-1) was proposed to extend to a depth of 150 feet bgs per the work plan (Tetra Tech, 2014a). However, saturated soil was encountered in AOC4-1 at approximately 136 to 137 feet bgs and the boring was terminated. This is in accordance with the Order, which required drilling in the vadose zone (i.e., unsaturated zone) to the fine-grained unit between 115 and 150 feet bgs. Sandy silt was encountered at 121 feet bgs in the boring, so the requirements of the Order were met.

At each soil boring, one sample per 10-foot interval was proposed for analysis of chromium and hexavalent chromium per the work plan (Tetra Tech, 2014a). However, in two intervals no samples were recovered due to gravel and cobbles: the 105- to 110-foot interval in boring AOC6-1 and the 85- to 90-foot interval in boring AOC19-1.

The HSA drilling rig experienced refusal at 135 feet bgs at boring AOC7-2 due to difficult drilling conditions and was not advanced to the target depth of 150 feet bgs. The proposed environmental sample for the 145- to 150-foot interval was not collected. Per the Order, this boring was to be drilled to the fine-grained unit between 115 and 150 feet bgs. Silty sand to sandy silt was encountered from 117 to 129 feet bgs, so the requirements of the Order were met.

Following drilling in AOC 11, the laboratory determined that the samples from one of the borings (AOC11-1) were compromised. Due to improper seals on the sample containers and ice containers, water from the melted ice had infiltrated some of the soil samples. Therefore, a replacement boring was drilled immediately adjacent to the original boring location. The new boring was designated AOC11-1R. All analytical data included in this report from that location are from boring AOC11-1R, with the exception of one geotechnical sample (the geotechnical sample was stored in a separate cooler and was not compromised).

3.5 EQUIPMENT DECONTAMINATION

Soil sampling equipment was either disposed after use or decontaminated between samples by washing with a non-phosphate detergent solution, rinsing in tap water, and rinsing in distilled water, followed by air drying or shaking to remove excess water. Drilling equipment which did not come into contact with the soil samples (augers, drill rods, etc.) was decontaminated between boreholes by high-pressure washing.

3.6 SURVEYING

The soil boring locations were surveyed for horizontal coordinates and elevation by Calvada Surveying, Inc. of Corona, California. Surveying was performed under the supervision of a California-licensed Professional Land Surveyor. Static global positioning system methods were used for surveying the location of the boreholes. Horizontal positions were provided in the California State Plane (Zone V) coordinate system relative to the North American Datum of 1983 (NAD 83); elevations were determined relative to the North American Vertical Datum of 1988 (NAVD 88). Copies of the survey data are provided in Appendix D, and the surveyed coordinates are presented on the boring logs (Appendix B).

3.7 INVESTIGATION-DERIVED WASTE MANAGEMENT

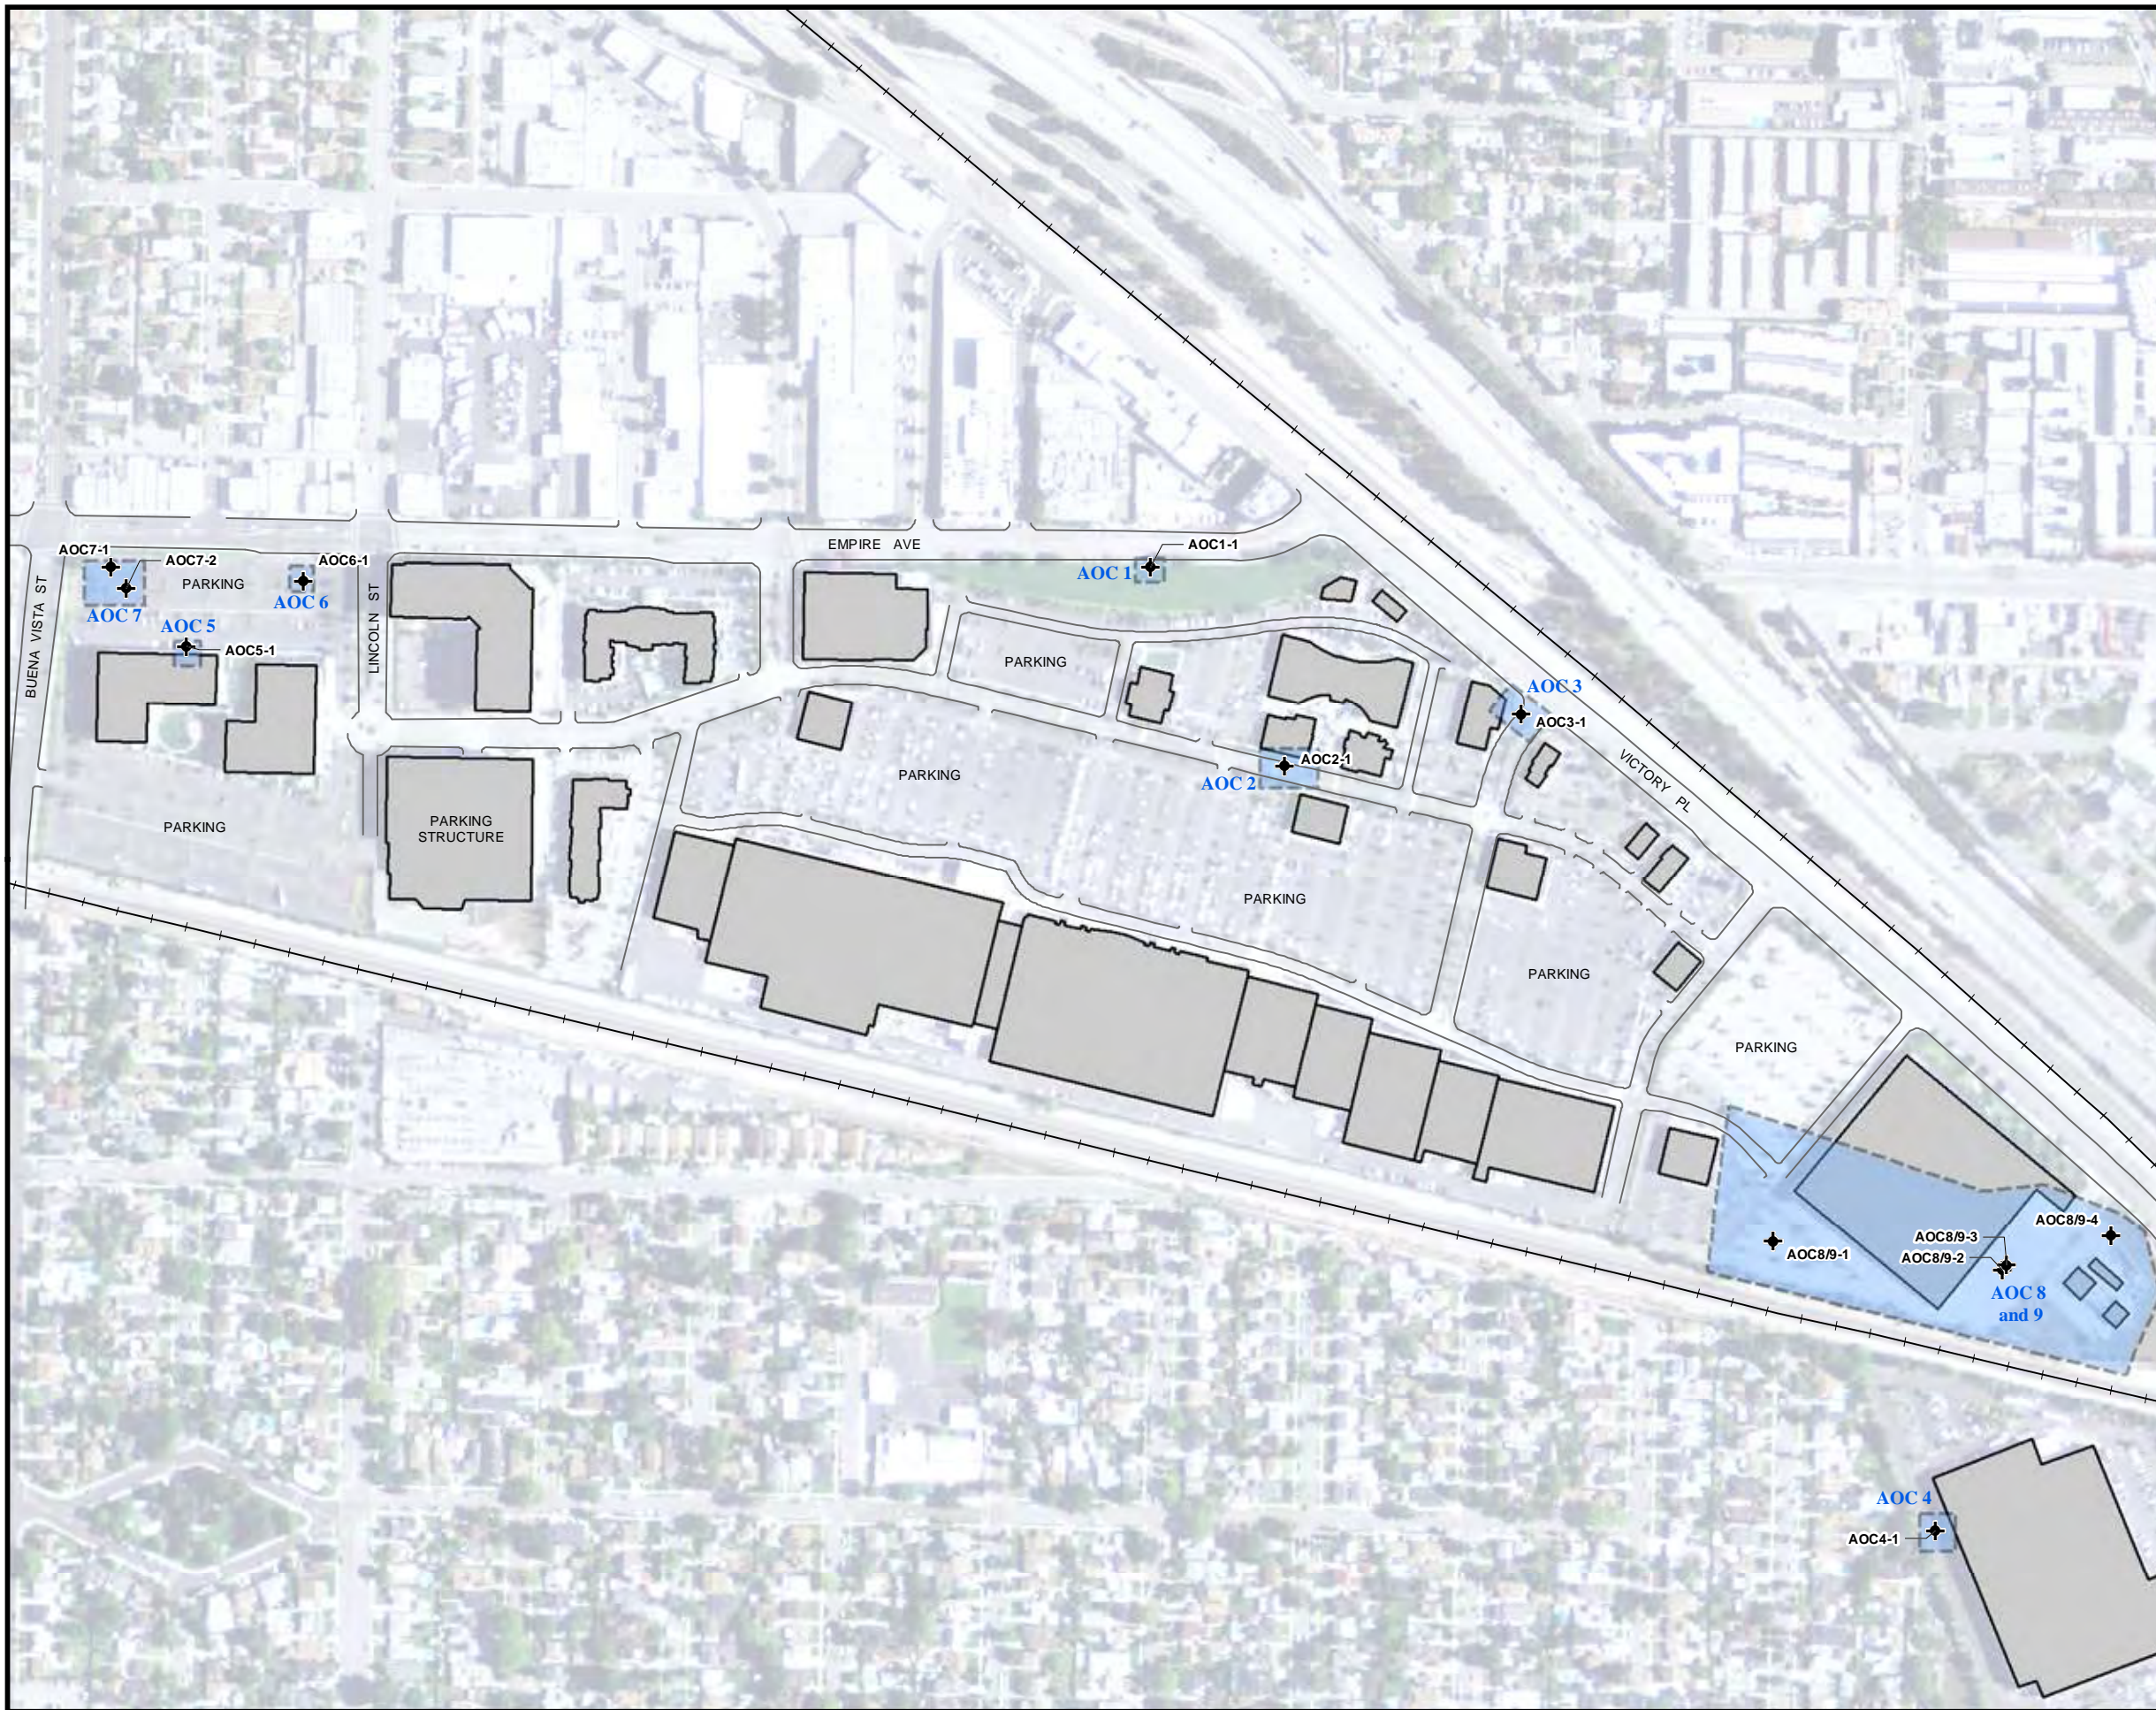

Wastes generated during the field investigation included used personal protective equipment; disposable sampling equipment; and construction debris such as concrete cores, soil cuttings, and water used for equipment decontamination. These wastes were disposed as municipal waste.

Soil cuttings were temporarily stored on-site in roll-off bins. These wastes were then sampled, profiled, and disposed at a Lockheed Martin-approved facility licensed to accept the waste, in accordance with the Lockheed Martin-approved *Waste Management Plan* developed for the project (Tetra Tech, 2014g). Copies of the waste manifests are provided in Appendix E (one of the five soil bins is still on site pending disposal).

Water used for decontamination was temporarily stored on site in labeled Department of Transportation-approved 55-gallon drums. The drum contents were sampled and profiled, and the analytical results for the waste and water volumes were provided to the nearby Burbank Operable Unit (BOU) water treatment plant (WTP) operators. The drum contents were decanted to remove suspended solids, pumped into a water trailer, and transported to the BOU WTP in accordance with

the Lockheed Martin-approved Waste Management Plan. The water was pumped to the storm water runoff treatment system (Tank 600) for treatment, with concurrence from WTP operators. Residual solids remaining in the drums were consolidated into a single drum, sampled, profiled, and is currently on site pending disposal at a Lockheed Martin-approved facility licensed to accept the waste.

Section 4

ANALYTICAL RESULTS

This section provides the results of the soil investigation performed at the former Lockheed Martin Corporation (Lockheed Martin) Burbank facilities.

4.1 RESULTS

Analytical results for soil are summarized in Tables 1 through 5. Copies of the laboratory analytical reports are provided in Appendix F (chemical, geochemical, leachability, and available hexavalent chromium analyses) and Appendix G (geotechnical analyses).

4.1.1 Environmental Analyses

Analytical results for environmental analyses of soil (total chromium and hexavalent chromium) are summarized in Table 1. Copies of the laboratory analytical reports are provided in Appendix F.

4.1.1.1 Volatile Organic Compounds

Per the approved work plan eight of the 20 areas of concern (AOCs) were to be investigated for volatile organic compounds (VOCs), including AOCs 2, 4 through 9, and 11. The approved work plan indicated that soil samples would be collected for VOC testing and soil-gas probes would be installed based on field screening. However, no soil samples exhibited photo-ionization detector (PID) headspace readings greater than the field screening criteria of 50 parts per million (ppm), so no soil samples were analyzed for VOCs and no soil-gas probes were installed. The PID measurements ranged from 0.0 to 31.2 ppm.

4.1.1.2 Total Chromium

A total of 340 samples (plus 43 duplicate samples) were analyzed for total chromium using United States Environmental Protection Agency (USEPA) Method SW3050B/6020A. Total chromium was detected in all analyzed samples at concentrations ranging from 1.60 to 461 milligrams per kilogram (mg/kg). All results were reported on a dry-weight basis (moisture contents were determined by American Society for Testing and Materials [ASTM] D2216.)

4.1.1.3 Hexavalent Chromium

A total of 340 samples (plus 43 duplicate samples) were analyzed for hexavalent chromium using USEPA Method SW3060A/7199. Hexavalent chromium was detected in 43 of the 340 primary samples (12% of the samples), and the detections were limited to AOC 2 (3 detections), AOC 7 (14 detections), AOC 8/9 (16 detections), AOC 11 (7 detections), and AOC 13 (3 detections). Hexavalent chromium detections ranged from 0.217 to 32.0 mg/kg. All results were reported on a dry-weight basis (moisture contents were determined by ASTM D2216).

4.1.1.4 Trivalent Chromium

The total chromium values include both trivalent chromium and hexavalent chromium, and the trivalent chromium concentration can be calculated by subtracting the hexavalent chromium concentration from the total chromium concentration. The calculated trivalent chromium values are presented on Table 1 (when hexavalent chromium was not detected, a hexavalent chromium concentration of ½ of the method detection limit, or 0.05 mg/kg, was used for the calculation). Total chromium was present in all samples, even in borings where no hexavalent chromium was detected in any samples. These data indicate that chromium is present as a background element in these soils. Therefore, the detection of total chromium in the soil samples does not necessarily indicate that a chromium release occurred at the location of the boring.

4.1.1.5 Background Chromium Concentrations

An evaluation was performed of the total chromium concentrations for samples at locations where it is unlikely that the total chromium value was affected by a release of chromium, in order to estimate the background concentration. To avoid including data from samples that may have been affected by a release of hexavalent chromium, samples were excluded if they included detectable hexavalent chromium. In addition, samples that were within 10 or 20 feet of a sample with detectable hexavalent chromium were excluded from this dataset. The intent of this classification effort was to identify those samples which would be very unlikely to have been affected, and thus could be used to estimate the attenuation characteristics of the deeper soils. Of the 340 chromium detections, 265 were determined to be unaffected by hexavalent chromium releases, and 75 were determined to be affected or potentially affected (Table 1). For this release-unaffected dataset, the minimum and maximum total chromium concentrations were 1.6 and 111 mg/kg. The higher values (above approximately 25 mg/kg) in this dataset are from borings that did not have any nearby hexavalent

chromium detections, and thus are still considered to be representative of background concentrations. The dataset appears to be log-normally distributed, with a geometric mean value of 5.5 mg/kg and arithmetic mean of 7.2 mg/kg.

There may be low levels of naturally occurring hexavalent chromium present in some soils. Hexavalent chromium has been found in groundwater in arid areas (Izbicki and others, 2012; Ball and Izbicki, 2004; Ball and others, 2008) at concentrations exceeding 50 micrograms per liter ($\mu\text{g/L}$) in some areas. However, for the purposes of this evaluation, it is assumed that the presence of hexavalent chromium is the result of a release.

4.1.2 Geochemical Analyses

Analytical results for geochemical analyses are summarized in Table 2. Copies of the laboratory analytical reports are provided in Appendix F.

4.1.2.1 Sulfide

A total of 12 samples were analyzed for sulfide using USEPA Method E376.2. Sulfide was detected in all analyzed samples, at concentrations ranging from 0.500 to 5.54 mg/kg. Concentrations of sulfide generally increased in finer-grain soils, with average concentrations of 1.82 mg/kg, 3.51 mg/kg, and 5.18 mg/kg, for sand, silty sand, and silt samples, respectively.

4.1.2.2 Iron

A total of 12 samples were analyzed for iron using USEPA Method SW3050B/6020A. Iron was detected in all analyzed samples, at concentrations ranging from 5,300 to 35,300 mg/kg. The iron could be contained in minerals and/or dissolved in the pore water. With these concentrations, nearly all of the iron is contained in the minerals. Concentrations of iron generally increased in finer-grain soils. Iron concentrations were highest in the silt sample (35,000 mg/kg), and lowest in the sand samples (average, 8,900 mg/kg). The three silty sand samples had an intermediate average concentration of 12,700 mg/kg.

4.1.2.3 Manganese

A total of 12 samples were analyzed for manganese using USEPA Method SW3050B/6020A. Manganese was detected in all analyzed samples, at concentrations ranging from 96.6 to 666 mg/kg, nearly two orders of magnitude lower than the concentrations of iron. Similar to the iron and sulfide

results, there is an apparent relationship between the concentrations of manganese and grain size, with average concentrations of 206 mg/kg, 243 mg/kg, and 666 mg/kg, for sand, silty sand, and silt samples, respectively.

4.1.2.4 pH

A total of 26 samples were analyzed for pH using USEPA Method SW9045. The pH measurements ranged from 7.62 to 9.70. These values, with some exceptions, are in the range of pH measurements that would be expected in the western United States if acid-producing reactions, such as pyrite oxidation or leaching of organic acids, are not occurring. Evaporation during infiltration causes precipitation of calcium calcite, making soils alkaline. The higher pH measurements (9.7 and perhaps 8.8) may be higher than the background values.

The holding time for soil pH measurements is not specified by the method but the method indicates the pH should be measured as soon as possible. Because of the data-collection design, in which the samples for the geochemical measurements, including pH, were to be selected based on the detected hexavalent chromium concentrations, the soil samples for pH testing were not analyzed until approximately one month had elapsed. While it was unlikely that the pH would change significantly during the holding period, a set of pH measurements was made on soil samples from one boring (AOC4-1) within one day to provide information on whether the pH measurements were likely to change during the one month period before the other measurements were made. The measurements completed within one day ranged from 7.66 to 8.92. Figure 10 shows the histograms of these two data sets. Their histograms are similar, but suggest that the pH measurement of 9.7 from the earlier measurements may be an outlier. The similarity between the two histograms suggests that the delayed testing did not appreciably affect the pH measurements. Further, the soil samples from boring AOC4-1 were retested one month after they were collected to provide a comparison for samples collected from the other borings. The results showed a slight increase on the later samples. The percentage change in pH values in the later samples ranged from -0.11 to +6.26%, with an average change of +2.78%. As originally assumed the change was not significant.

4.1.2.5 Total Organic Carbon

A total of 12 samples were analyzed for total organic carbon using USEPA Method SW9060. Total organic carbon was detected in three analyzed samples, at concentrations ranging from 500 to 4,200 mg/kg.

4.1.3 Geotechnical Analyses

Twelve representative soil samples were selected for geotechnical analyses, including grain size analysis (sieve and hydrometer), dry bulk density, specific gravity, porosity, and moisture content. Analytical results for the geotechnical analyses are summarized in Table 3. Copies of the laboratory analytical reports are provided in Appendix G.

4.1.4 Available Hexavalent Chromium Attenuation Capacity Analyses

Available hexavalent chromium attenuation capacity (AHCAC) testing was performed on selected soil samples to determine the AHCAC using a variant of the “available chromium reducing capacity” test referenced in *Natural Attenuation of Hexavalent Chromium in Groundwater and Soils* (USEPA, 1994) and described in (Bartlett and James, 1988). The AHCAC analyses indicated that some site soils have the capacity to cause the chemical reduction of hexavalent chromium to trivalent chromium, resulting in its attenuation in the vadose zone. A description of the analysis is provided in Appendix C and analytical results for the AHCAC analyses are summarized in Table 4. Copies of the laboratory analytical reports are provided in Appendix F.

4.1.5 Leachability Analyses

Select soil samples were tested using a modified Synthetic Precipitation Leaching Procedure (SPLP) to determine the mobility of chromium present in the soil. The SPLP test is used to evaluate the fraction of the total and hexavalent chromium which is dissolved or easily dissolvable. A description of the SPLP analyses performed is provided in Appendix C.

The resulting leachates were then analyzed for total chromium (USEPA SW6020A), hexavalent chromium (USEPA SW7199), iron (USEPA SW6020A), and pH (USEPA SW9040B). Analytical results for the leachability analyses are summarized in Table 5. Copies of the laboratory analytical reports are provided in Appendix F.

4.2 DATA QUALITY ASSESSMENT

A total of 383 soil samples were collected and analyzed for total chromium and hexavalent chromium by USEPA Methods SW3050B/6020A and SW3060A/7199, respectively. Level II data validation was performed to assess the usability of the data. Data validation included evaluation of sample holding times, method and field blank sample results, laboratory control sample results,

matrix spike/matrix spike duplicate, field duplicate results, calibration compliance, compound identification, and method compliance. A total of 6.8% of the metals data were qualified as estimated (and assigned a “J” qualifier) due to the quality control exceedances. However, the data were found usable for the intended purpose. All of the qualified and unqualified data results may be used as stated and are of known and acceptable precision and accuracy. A copy of the data validation memorandum prepared by the project chemist is provided in Appendix H.

The geochemical and the attenuation evaluation data were not validated. All testing equipment was operated in accordance with method specified criteria.

As mentioned in Section 3.2.1, equipment blank samples were collected daily to confirm proper decontamination between samples and determine if cross contamination of the environmental samples occurred during sampling. The equipment blanks were analyzed as specified in Section 3.2.2.1 and the results show no environmental data were qualified because of field blank contamination. All equipment blank results were non-detect (ND).

As mentioned in Section 3.2.1, field duplicate samples were collected at a minimum frequency of 10% to assess sampling and analytical precision. Precision is established by calculating the relative percent difference (RPD) between the primary samples and the corresponding field duplicates. The RPD values indicate that 24 of the 86 field duplicate analyses were outside of control limits.

Notes: mg/kg = milligrams per kilogram
 ND<# = analyte not detected; method detection limit concentration is shown
 J = the analyte was positively identified, but the analyte concentration is an estimated value
 f = the duplicate samples' Relative Percent Difference (RPD) was outside the control limit
 c = the matrix spike (MS) and/or matrix spike duplicate (MSD) recoveries were outside control limits

* Trivalent chromium value shown is the difference between the total chromium and hexavalent chromium, and not based directly on laboratory results; in the case of hexavalent chromium=ND, 1/2 of the method detection limit (i.e., 0.05) was used as the hexavalent chromium value

** "Yes" indicates the sample is considered affected or potentially by a historical hexavalent chromium release as described in Section 4.1.1.5

Section 5

HEXAVALENT CHROMIUM EVALUATION

Dissolved hexavalent chromium in the vadose zone can undergo attenuation processes and understanding the degree to which the conditions for this exist is an important component of the investigation of a release of this chemical. Under certain conditions, hexavalent chromium can be reduced to the less toxic trivalent chromium in soils. Understanding the attenuation capacity of a site requires that the following be determined 1) that there are natural reductants present, 2) the amount of hexavalent chromium and other reactive constituents do not exceed the capacity to reduce them, 3) the trivalent chromium will remain immobile, and 4) there is no net oxidation of trivalent chromium to hexavalent chromium. This section of the document describes an overview of the hexavalent chromium evaluation performed for the site. A more detailed description of the presence and mobility of chromium is provided in Appendix C.

5.1 GEOCHEMICAL PARAMETERS

The data from the geochemical analyses (Section 4.1.2) indicate that iron- and sulfide-bearing minerals are present. These minerals may react to cause reduction and precipitation of hexavalent chromium if chemical conditions are appropriate.

Organic carbon was detected in three of the analyzed samples, and its presence appears to be associated with higher trivalent chromium concentrations. Manganese was also present in the samples at concentrations much lower than the iron concentrations. While manganese has been found to cause oxidation of trivalent chromium to hexavalent chromium, it is unlikely that this manganese is present in a form and at concentrations that would cause this to occur, and there were no observed relationships between manganese concentrations and trivalent or hexavalent chromium concentrations.

Finally, the pH data indicate that the soils are alkaline, with all pH measurements higher than 7.6.

5.2 AVAILABLE HEXAVALENT CHROMIUM ATTENUATION CAPACITY

Selected soil samples were analyzed to evaluate the attenuation capacity using an available hexavalent chromium attenuation capacity (AHCAC) analysis. The analysis is a variant of the “available chromium reducing capacity” test referenced in Natural Attenuation of Hexavalent Chromium in Groundwater and Soils (United States Environmental Protection Agency [USEPA], 1994) and described in Bartlett and James (1988).

As described in Section 4.1.1.5, the term “unaffected” is used to represent the samples which are unlikely to have been affected by hexavalent chromium releases. The majority of these samples are from borings that did not contain any detectable hexavalent chromium. The term “affected” is used, for ease of reference, to indicate the remaining samples, which are affected or potentially affected by releases.

For the purposes of predicting the potential for future hexavalent chromium movement to the water table, the value for AHCAC that will be used for unaffected soils will be the average for the unaffected samples less the average for those samples with detectable hexavalent chromium, or 5.38 mg/kg (7.26 mg/kg minus 1.88 mg/kg).

5.3 SYNTHETIC PRECIPITATION LEACHING PROCEDURE

The modified synthetic precipitation leaching procedure (SPLP) tests were performed on the same 12 soil samples selected for the geochemical analyses (Table 5), providing soil pH data for comparison with the leachate pH data from the SPLP tests. These included 2 samples deemed to be unaffected and 10 samples deemed to be affected. The leachates for the 2 samples in the unaffected grouping (AOC7-1-145 and AOC11-1R-100) did not contain detectable chromium, even though both soil samples contained trivalent chromium. The leachates from affected soil samples contained both hexavalent chromium and trivalent chromium, and the trivalent chromium concentrations were consistently higher than those of hexavalent chromium. The trivalent chromium could have been present in the pore water, which is unlikely given its low solubility at neutral to slightly alkaline pH; could have been released by dissolution of trivalent chromium-bearing hydroxide or oxyhydroxide solids; or could have been produced by reduction of hexavalent chromium in the pore water. The measured iron concentrations are typical of iron concentrations in equilibrium with iron hydroxide [Fe(OH)₃] or iron oxyhydroxide (FeOOH), but are much higher than would be in equilibrium with

chromium-iron hydroxide [$\text{Cr}_x\text{Fe}_{1-x}(\text{OH})_3$] or oxyhydroxide compounds. Thus, it is unlikely that the trivalent chromium was released by dissolution of chromium-iron hydroxide or oxyhydroxide compounds.

The presence of the trivalent chromium is best explained by reduction of hexavalent chromium, consistent with the presence of measurable AHCAC in the soils. While no geochemical speciation modeling was performed, it is likely that at the pH values of the samples, the Eh of the water will be controlled by the solubility of the iron hydroxide or iron oxyhydroxide at a value where trivalent chromium would be the prevalent chromium oxidation state.

Calculations of the mass of chromium in the leachate from the SPLP tests indicate that the mass of chromium (total chromium, hexavalent chromium + trivalent chromium) in the leachate is less than 10% of the mass of hexavalent chromium contained in the soil samples. For individual samples, the percentage ranges from 2% to nearly 60% of the mass of hexavalent chromium in the soil sample; the higher values occur with the samples that had low hexavalent chromium concentrations in the soil samples. The low mass in the leachate would suggest either the hexavalent chromium value in the soil sample represents both aqueous and solid-bound hexavalent chromium, or that it represents only aqueous hexavalent chromium, with only a portion of the aqueous hexavalent chromium being removed in the SPLP test.

The SPLP testing provided two important pieces of information:

1. The interaction between the soil and the leaching solutions released iron, hexavalent chromium, and trivalent chromium from the soils.
2. The total mass of chromium released in the SPLP tests was less than 10% of the mass of hexavalent chromium present in the soils, indicating either that some of the hexavalent chromium is present in a low-solubility form, or that it is removed from the leachate by precipitation. This percentage is consistent with the presence of AHCAC remaining in the sample. Additional leaching steps would release additional hexavalent chromium, but not more than the original mass of hexavalent chromium in the sample.

5.4 HEXAVALENT CHROMIUM ATTENUATION ASSESSMENT

This initial assessment of the likelihood that hexavalent chromium present in the vadose zone at the locations of the borings was conducted in the manner outlined by USEPA (1994). The USEPA document recommends determining whether the following criteria are met.

1. There are natural reductants present.
2. The amount of hexavalent chromium and other reactive constituents do not exceed the capacity to reduce them.
3. The rate of hexavalent chromium reduction is greater than the rate of transport of the aqueous hexavalent chromium.
4. The trivalent chromium remains immobile.
5. There is no net oxidation of trivalent chromium to hexavalent chromium.

Item 3 is not considered in this initial evaluation. Determining the kinetics of hexavalent chromium reduction in the soil column is difficult. Therefore, evaluating Item 3 has been postponed until it has been determined that it is necessary. However, it is known that the land use and operational practices at the various areas of concern (AOCs) have changed in ways that would tend to reduce infiltration rates and thus slow the movement of water and dissolved hexavalent chromium.

5.4.1 Presence of Natural Reductants

Natural reductants have been demonstrated to be present in the soils. The most direct evidence for their presence is provided by the AHCAC testing. The AHCAC testing shows that the soils are capable of reducing and removing hexavalent chromium from the test solutions. As expected, there is variability in the AHCAC values. The maximum AHCAC for the unaffected samples was about 20 mg/kg, and the average was approximately 7 mg/kg. The soils that were deemed to be affected by releases also have AHCAC. Nearly all samples that contained hexavalent chromium still had AHCAC remaining.

5.4.2 Comparison of the Mass of Hexavalent Chromium and the AHCAC

In order for the AHCAC of the soil to reduce the hexavalent chromium in the soil column and prevent it from reaching the water table, there must be sufficient AHCAC available in the soil column below the hexavalent chromium. The simplest way to evaluate this would be to estimate the

mass of hexavalent chromium available for further transport, and compare that mass to the total AHCAC between the greatest depth of detected hexavalent chromium and the water table.

Table 6 provides the estimates of the mass of hexavalent chromium at the location of the indicated boring from the land surface down to the depth of the last sample that indicated the presence of hexavalent chromium, and the integrated AHCAC from that depth down to the water table. The comparison is presented as a ratio; if the ratio is less than 1, then it is likely that there is sufficient AHCAC below the depth of greatest observed migration to attenuate the hexavalent chromium. The comparison assumes that 100% of the mass of hexavalent chromium is available for transport. In other words, all of the hexavalent chromium is leachable and no attenuation will occur at depths shallower than the maximum depth of detected hexavalent chromium (a conservative estimate). Also shown are results which assume that only 10% of the observed hexavalent chromium concentration is mobile.

The mass of hexavalent chromium is much less than the AHCAC in AOC2-1, AOC11-1R, AOC11-2, and AOC13-1, even assuming that 100% the hexavalent chromium is mobile. In these locations, the future migration of hexavalent chromium to the water table is unlikely. However, if all of the hexavalent chromium is mobile in borings AOC7-2 and AOC8/9-1, the hexavalent chromium mass that is present appears to exceed the AHCAC below the bottom of the borings.

Appendix C provides a detailed description of the evaluation. In summary, the evaluation revealed:

1. The AHCAC below the depth of greatest observed migration greatly exceeds the mass of hexavalent chromium in borings AOC2-1, AOC11-1R, AOC11-2, and AOC13-1, even if 100% of the hexavalent chromium is mobile.
2. The extent of the present hexavalent chromium migration was not determined in boring AOC7-2, and the observed depth of migration is within 35 feet of the water table. It is possible that migration to the water table has already occurred.
3. The borings in AOCs 8 and 9 only extend to depths of 55 or 60 feet and the depth to water is approximately 145 feet. Thus, the extent of hexavalent chromium migration below 60 feet is unknown. The known hexavalent chromium mass in boring AOC8/9-1 exceeds the deeper AHCAC if all of the hexavalent chromium is mobile. However, if only 10% is mobile, then the depth to where the AHCAC becomes less than the mobile mass is above but close to the water table. The presently known hexavalent chromium mass is less for the other borings in

AOC8/9. However, it is still possible that migration to the water table could occur if only 10% of the mass is mobile.

4. It is unlikely that future migration would reach the water table at AOC13-2. The mass of hexavalent chromium observed in the boring is likely to be too low to exceed the AHCAC below the depth of the boring.

5.4.3 Stability of Trivalent Chromium

The range of soil pH observed is within the range consistent with the stability of trivalent chromium. The pH is unlikely to shift to values outside the range of observed soil pH measurements, and the chromium hydroxide and chromium-iron hydroxide precipitates are stable over a larger pH range than observed. Unless the trivalent chromium is oxidized to hexavalent chromium, the trivalent chromium should remain stable, as explained in Appendix C.

5.4.4 No Net Oxidation of Trivalent Chromium to Hexavalent Chromium

The attenuation of hexavalent chromium is achieved by reduction to trivalent chromium followed by precipitation of a low-solubility compound. If the trivalent chromium-bearing solid is oxidized, then the resulting hexavalent chromium will be mobile. Trivalent chromium can be oxidized by reduction of manganese and by decreasing the pH to low levels. If the AHCAC is exhausted, then oxidation by manganese can be a concern.

No laboratory tests were performed to evaluate the stability of the trivalent chromium. However, indirect evidence indicates that this is unlikely. First, during logging of the borings, the geologists were instructed to note any manganese coatings, which would be formed if manganese were being reduced to Mn(II) by oxidation of trivalent chromium, because of re-oxidation by atmospheric oxygen. None were observed. Second, the ratio of total iron to total manganese in the samples ranges from 19 to 67, with an average of 53, so that if oxidation of trivalent chromium by manganese occurs, the hexavalent chromium will likely be re-reduced by the iron. Thus, release of hexavalent chromium by the manganese present in the soils is not expected to occur.

5.5 SUMMARY

The evaluation of the data from the borings indicates:

-
- Only the borings from AOCs 2, 7, 8, 9, 11, and 13 contained samples that had hexavalent chromium detected in the soil.
 - The chemistry of the soil can promote the reduction of hexavalent chromium to trivalent chromium which would be followed by precipitation of the trivalent chromium to a low-solubility solid phase, resulting in natural attenuation of the hexavalent chromium.
 - The attenuation capacity for limiting the further migration of hexavalent chromium appears to be sufficient at AOCs 2, 11, and 13 to prevent the detected hexavalent chromium from migrating to the water table.
 - At AOCs 7, 8, and 9, the attenuation capacity may be insufficient to prevent the migration to the water table.

The rate of water migration downward through the vadose zone has not been evaluated. The change in use of the properties and resulting changes in water-use practices has likely decreased the rate of water movement, and thus would have reduced the potential of any continued migration of hexavalent chromium vertically toward the water table.

Notes: mg = milligrams
AHCAC = available hexavalent chromium attenuation capacity

Section 6

CONCEPTUAL SITE MODELS

This section provides updates to the Conceptual Site Models (CSMs) for the specified features at each area of concern (AOC) that was investigated. Each CSM update describes the local geologic and hydrogeologic conditions, the results from this investigation, a determination of the adequacy of delineation, and an assessment of the potential for the use of the feature to impact groundwater. Detailed descriptions of the historical use of the AOCs, and the previous investigation and remedial history of the AOCs were provided in the *Revised Additional Site Investigation Work Plan, Former Burbank Plants A-1 North, B-1, B-6, and C-1, Burbank, California* (Tetra Tech, 2014a), and have been included in Appendix I of this report.

Between one and five features located within 19 AOCs were investigated. The AOCs are located within three of Lockheed Martin Corporation's (Lockheed Martin's) former plants B-1, B-6, and C-1. For ease of reference, each AOC has been assigned a number corresponding to the sequence in which they were presented in the Order; the locations of these numbered areas are shown on Figures 8 and 9. As discussed earlier in Section 1 of the document, AOC 10 was held in abeyance by the Regional Water Quality Control Board, Los Angeles (Regional Board) and was not investigated. Therefore, an update to the CSM for AOC 10 will not be provided.

6.1 AOC 1 – PLANT B-1 SEEPAGE PIT DW-1

Seepage Pit DW-1 was located north of the current Hometown Buffet restaurant building within the Burbank Empire Center shopping district, south of Empire Avenue. The location of the feature is currently overlain by a landscaped area. The location will be developed in 2015 as part of the Empire Avenue Underpass project.

6.1.1 Geology and Hydrogeology within AOC 1

Based on the results of the current investigation and review of boring logs from nearby borings, AOC 1 is underlain by sand from approximately 0 to 43 feet below ground surface (bgs), silty sand to sand with silt from 43 to 67 feet bgs, sand with gravel and cobbles from 67 to 95 feet bgs, and interbedded sand and silty sand from 95 to at least 150 feet bgs, as presented on Figure 11. In April

2014, the depth to groundwater beneath AOC 1 was approximately 155 feet, as mapped by Tetra Tech (2014b) and shown on Figure 3. This AOC is in the northern portion of the former Plant B-1 within the 1 microgram per liter ($\mu\text{g/L}$) hexavalent chromium groundwater plume contour, as mapped by Tetra Tech (2014b) and shown on Figure 7.

6.1.2 Results of the Current Investigation

One boring, AOC1-1, was advanced in the vicinity of the former feature to a depth of 150 feet bgs. The location of the boring is shown on Figures 8 and 11. Soil samples were collected at 5-foot intervals to total depth for logging soil lithology. Total chromium and hexavalent chromium analyses were performed at a rate of one per 10 feet. Total chromium was detected at concentrations ranging from 1.81 to 21.1 mg/kg. Hexavalent chromium was not detected in the samples (less than 0.10 mg/kg).

6.1.3 Adequacy of Delineation

Hexavalent chromium was not detected in any of the samples submitted for testing as part of this investigation. Therefore, there do not appear to be hexavalent chromium impacts that require additional delineation at this AOC.

6.1.4 Potential for Impact to Groundwater

Based on site data, there is no evidence that activities associated with seepage pit DW-1 represent a potential ongoing or future source of hexavalent chromium in soil or to groundwater.

6.2 AOC 2 – PLANT B-1 DRY WELLS DW-2 AND DW-2A

Dry Wells DW-2 and DW-2A were located immediately south of the current Outback Steakhouse restaurant within the Burbank Empire Center shopping district. The locations of the former dry wells are currently overlain by an asphalt-paved private road within the parking lot for the Empire Center.

6.2.1 Geology and Hydrogeology within AOC 2

Based on the results of the current investigation and review of boring logs from nearby borings, AOC 2 is underlain by fill from approximately 0 to 12 feet bgs, sand from 11 to 40 feet bgs (with some silty sand present locally at 15 feet bgs), silty sand and sandy silt from 40 to 48 feet bgs, sand from 48 to 55 feet bgs, silty sand and sandy silt from 55 to 60 feet bgs, sand with gravel and cobbles

from 60 to 120 feet bgs, silty sand from 120 to 124 feet bgs, sand from 124 to 136 feet bgs, interbedded sand, silt, and clay from 136 to 145 feet bgs, and sand from 142 to at least 150 feet bgs, as presented on Figure 12. In April 2014, the depth to groundwater beneath AOC 2 was approximately 155 feet, as mapped by Tetra Tech (2014b) and shown on Figure 3. This AOC is located in the northern portion of former Plant B-1 within the 100- $\mu\text{g/L}$ tetrachloroethene (PCE), 5- $\mu\text{g/L}$ trichloroethene (TCE), and 1- $\mu\text{g/L}$ (hexavalent chromium) groundwater plume contours, as mapped by Tetra Tech (2014b) and shown on Figures 4, 5, and 7, respectively.

6.2.2 Results of the Current Investigation

One boring, AOC2-1, was advanced between the former features to a depth of 150 feet bgs. The location of the boring is shown on Figures 8 and 12. Soil samples were collected at 5-foot intervals to total depth for logging soil lithology. Total chromium and hexavalent chromium analyses were performed at a rate of one per 10 feet. Total chromium was detected at concentrations ranging from 2.87 to 20.3 mg/kg. Hexavalent chromium was detected in three samples collected at 40 feet bgs, 45 feet bgs, and 70 feet bgs at concentrations ranging from 0.217 to 0.918 mg/kg. Hexavalent chromium was not detected in the remaining samples (less than 0.10 mg/kg).

All soil samples were screened with a photo-ionization detector (PID). The PID readings ranged from 0.0 to 5.2 parts per million (ppm). In accordance with the approved work plan, no samples were submitted for VOC analyses and soil-gas probes were not installed since none of the PID readings exceeded the 50-ppm field screening criteria.

6.2.3 Adequacy of Delineation

The dry wells and the adjacent soil were previously removed and the historical borings delineated the horizontal and vertical extent of hexavalent chromium in soil.

The supplemental boring installed as part of this investigation generally confirmed the earlier findings. The boring was advanced in a location between the two former dry wells and delineated the depth of hexavalent chromium in soil in that location. The deepest hexavalent chromium detection was at a depth of 70 feet, and the deepest sample tested was from 150 feet.

PID readings were below the screening criteria of 50 ppm. Therefore, there do not appear to be VOC impacts that require additional delineation.

6.2.4 Potential for Impact to Groundwater

The mass of hexavalent chromium detected in boring AOC2-1 is low, and the available hexavalent chromium attenuation capacity (AHCAC) below the depth of greatest observed migration greatly exceeds the mass of hexavalent chromium, even if 100% of the hexavalent chromium were mobile. The potential for this hexavalent chromium to impact the groundwater is low.

Based on the previous investigations and removals conducted at AOC 2 and the data collected and analyzed as part of this investigation, neither Dry Well DW-2 or DW-2A appear to represent a significant potential ongoing or future source of hexavalent chromium or VOCs in soil or to groundwater.

6.3 AOC 3 – PLANT B-1 SEEPAGE PIT DW-3

Former seepage pit DW-3 is in the area of the commercial buildings consisting of Catherine's Plus Sizes, a dental office, and Payless Shoes within the Burbank Empire Center shopping district, and is currently overlain by concrete sidewalk.

6.3.1 Geology and Hydrogeology within AOC 3

Based on the current investigation and review of boring logs from nearby borings, AOC 3 is underlain by silty sand from approximately 0 to 7 feet bgs, sand from 7 to 28 feet bgs, silty sand and sand with silt from 28 to 48 feet bgs, sand from 48 to 52 feet bgs, silty sand and sandy silt from 52 to 67 feet bgs, sand with gravel to sandy gravel from 66 to 102 feet bgs, sand from 102 to 112 feet bgs, silty sand and sand with silt from 112 to 117 feet bgs, silty sand from 117 to 120 feet bgs, sand from 120 to 147 feet bgs, and silty sand from 147 to at least 150 feet bgs, as presented on Figure 13. In April 2014, the depth to groundwater beneath AOC 3 was approximately 155 feet, as mapped by Tetra Tech (2014b) and shown on Figure 3. This AOC is in the northern portion of the former Plant B-1 within the 1- $\mu\text{g}/\text{L}$ hexavalent chromium groundwater plume contour, as mapped by Tetra Tech (2014b) and shown on Figure 7.

6.3.2 Results of the Current Investigation

One boring, AOC3-1, was advanced in the vicinity of the former feature to a depth of 150 feet bgs. The location of the boring is shown on Figures 8 and 13. Soil samples were collected at 5-foot intervals to total depth for logging soil lithology. Total chromium and hexavalent chromium

analyses were performed at a rate of one per 10 feet. Total chromium was detected at concentrations ranging from 2.42 to 27.9 mg/kg. Hexavalent chromium was not detected in the samples tested (less than 0.10 mg/kg).

6.3.3 Adequacy of Delineation

Hexavalent chromium was not detected in the samples tested from boring AOC3-1. Therefore, there do not appear to be hexavalent chromium impacts that require additional delineation.

6.3.4 Potential for Impact to Groundwater

Based on site data, there is no evidence that activities associated with seepage pit DW-3 represent a potential ongoing or future source of hexavalent chromium in soil or to groundwater.

6.4 AOC 4 – PLANT B-1 SEEPAGE PIT DW-4

Seepage Pit DW-4 is located west of the current Costco building, immediately east of residential houses. The location of the feature is overlain by an asphalt parking lot.

6.4.1 Geology and Hydrogeology within AOC 4

Based on the results of the current investigation and review of boring logs from nearby borings, AOC 4 is underlain by silty sand from approximately 0 to 7 feet bgs, sand from 7 to 25 feet bgs, sandy silt from 25 to 27 feet bgs, sand from 27 to 37 feet bgs, silty sand and sandy silt from 37 to 52 feet bgs, sand from 52 to 57 feet bgs, sand with gravel to sandy gravel from 57 to 88 feet bgs, sandy silt from 88 to 92 feet bgs, sand from 92 to 121 feet bgs, and silty sand to sandy silt from 121 to at least 137 feet bgs, as presented on Figure 14. In April 2014, the depth to groundwater beneath AOC 4 was approximately 135 feet, as mapped by Tetra Tech (2014b) and shown on Figure 3. This AOC is located in the southern portion of former Plant B-1 within the 50- μ g/L PCE, 50- μ g/L TCE, and 1- μ g/L hexavalent chromium groundwater plume contours, as mapped by Tetra Tech (2014b) and shown on Figures 4, 5, and 7.

6.4.2 Results of the Current Investigation

One boring, AOC4-1, was advanced in the vicinity of the former feature to a depth of 137 feet bgs. The location of the boring is shown on Figures 8 and 14. Soil samples were collected at 5-foot intervals to total depth for logging soil lithology. Total chromium and hexavalent chromium

analyses were performed at a rate of one per 10 feet. Total chromium was detected at concentrations ranging from 3.13 to 25.8 mg/kg. Hexavalent chromium was not detected in the samples (less than 0.10 mg/kg).

All soil samples were screened with a PID. The PID readings ranged from 0.0 to 5.5 ppm. In accordance with the approved work plan, no samples were submitted for VOC analyses and soil-gas probes were not installed since none of the PID readings exceeded the 50-ppm field screening criteria.

6.4.3 Adequacy of Delineation

Hexavalent chromium was not detected in the samples tested from boring AOC4-1, and PID readings were below the screening criteria of 50 ppm. Therefore, there do not appear to be hexavalent chromium or VOC impacts that require additional delineation.

6.4.4 Potential for Impact to Groundwater

Based on site data, there is no evidence that activities associated with seepage pit DW-4 represent a potential ongoing or future source of hexavalent chromium or VOCs in soil or to groundwater.

6.5 AOC 5 – PLANT B-1 SEEPAGE PIT DW-5

Seepage pit DW-5 is located under the northern portion of the Deluxe Digital Studios office building.

6.5.1 Geology and Hydrogeology within AOC 5

Based on the results of the current investigation and review of boring logs from nearby borings, AOC 5 is underlain by sand from approximately 0 to 22 feet bgs, silty sand from 22 to 27 feet bgs, sand from 27 to 57 feet bgs, silty sand from 57 to 62 feet bgs, sand from 62 to 67 feet bgs, sand with gravel and cobbles from 67 to 122 feet bgs (with a silty sand interbed at 100 feet bgs), and sand with varying amounts of gravel from 122 to at least 150 feet bgs, as presented on Figure 15. In April 2014, the depth to groundwater beneath AOC 5 was approximately 170 feet, as mapped by Tetra Tech (2014b) and shown on Figure 3. AOC 5 is located in the northwestern portion of former Plant B-1 within the 500- μ g/L PCE and 50- μ g/L TCE groundwater plume contours, and outside of the 1- μ g/L hexavalent chromium groundwater plume contour, as mapped by Tetra Tech (2014b) and shown on Figures 4, 5, and 7.

6.5.2 Results of the Current Investigation

One boring, AOC5-1, was advanced in the vicinity of the former feature to a depth of 150 feet bgs. The location of the boring is shown on Figures 8 and 15. Soil samples were collected at 5-foot intervals to total depth for logging soil lithology. Total chromium and hexavalent chromium analyses were performed at a rate of one per 10 feet. Total chromium was detected at concentrations ranging from 2.34 to 17.0 mg/kg. Hexavalent chromium was not detected in the samples (less than 0.10 mg/kg).

All soil samples were screened with a PID. The PID readings ranged from 0.0 to 2.5 ppm. In accordance with the approved work plan and subsequent Regional Board correspondence, no samples were submitted for VOC analyses and soil-gas probes were not installed since none of the photo ionization detector readings exceeded the 50-ppm field screening criteria.

6.5.3 Adequacy of Delineation

Hexavalent chromium was not detected in the samples tested from boring AOC5-1 and PID readings were below the screening criteria of 50 ppm. Therefore, there do not appear to be hexavalent chromium or VOC impacts that require additional delineation.

6.5.4 Potential for Impact to Groundwater

Based on site data, there is no evidence that activities associated with seepage pit DW-5 represent a potential ongoing or future source of hexavalent chromium or VOCs in soil or to groundwater.

6.6 AOC 6 – PLANT B-1 SEEPAGE PIT DW-6

Seepage pit DW-6 is located north of the Deluxe Digital Studios office building. The location of the former features is overlain by an asphalt-paved parking lot.

6.6.1 Geology and Hydrogeology within AOC 6

Based on the results of the current investigation and review of boring logs from nearby borings, AOC 6 is underlain by sand from approximately 0 to 26 feet bgs, silty sand from 26 to 32 feet bgs, sand from 32 to 52 feet bgs, silty sand from 52 to 58 feet bgs, sand from 58 to 62 feet bgs, sand with gravel and cobbles from 60 to 112 feet bgs, sand from 112 to 127 feet bgs, silty sand from 127 to 132 feet bgs, and sand with varying amount of gravel from 132 to at least 150 feet bgs, as presented

on Figure 16. In April 2014, the depth to groundwater beneath AOC 6 was approximately 170 feet, as mapped by Tetra Tech (2014b) and shown on Figure 3. AOC 5 is located in the northwestern portion of former Plant B-1 within the 500- $\mu\text{g}/\text{L}$ PCE and 25- $\mu\text{g}/\text{L}$ TCE groundwater plume contours, and outside of the 1- $\mu\text{g}/\text{L}$ hexavalent chromium groundwater plume contour, as mapped by Tetra Tech (2014b) and shown on Figures 4, 5, and 7.

6.6.2 Results of the Current Investigation

One boring, AOC6-1, was advanced in the vicinity of the former feature to a depth of 150 feet bgs. The location of the boring is shown on Figures 8 and 16. Soil samples were collected at 5-foot intervals to total depth for logging soil lithology. Total chromium and hexavalent chromium analyses were performed at a rate of one per 10 feet. Total chromium was detected at concentrations ranging from 2.98 to 13.7 mg/kg. Hexavalent chromium was not detected in the samples (less than 0.10 mg/kg).

All soil samples were screened with a PID. The PID readings ranged from 2.4 to 36.6 ppm. In accordance with the approved work plan and subsequent Regional Board correspondence, no samples were submitted for VOC analyses and soil-gas probes were not installed since none of the photo ionization detector readings exceeded the 50-ppm field screening criteria.

6.6.3 Adequacy of Delineation

Hexavalent chromium was not detected in boring AOC6-1 and PID readings were below the screening criteria of 50 ppm. Therefore, there do not appear to be hexavalent chromium or VOC impacts that require additional delineation.

6.6.4 Potential for Impact to Groundwater

Based on site data, there is no evidence that activities associated with seepage pit DW-6 represent a potential ongoing or future source of hexavalent chromium or VOCs in soil or to groundwater.

6.7 AOC 7 – PLANT B-1 BUILDING 175 VAPOR DEGREASER AND CLARIFIER

The former location Building 175 degreaser and clarifiers are located north of an office building (Deluxe Digital Studios), and southeast of the intersection of West Empire Avenue and North Buena Vista Street. The location of the former features is overlain by an asphalt-paved parking lot.

6.7.1 Geology and Hydrogeology within AOC 7

Based on the results of the current investigation and review of boring logs from nearby borings, AOC 7 is underlain by sand from approximately 0 to 17 feet bgs, silty sand from 17 to 27 feet bgs, sand from 27 to 62 feet bgs (with silty sand locally present at 55 feet bgs), sand with gravel and cobbles from 62 to 103 feet bgs, interbedded sand, sand with gravel, and silty sand from 103 to sand from 103 to 122 feet bgs, sandy silt from 122 to 128 feet bgs, and sand with varying amounts of gravel from 132 to at least 150 feet bgs, as presented on Figure 17. In April 2014, the depth to groundwater beneath AOC 7 was approximately 170 feet, as mapped by Tetra Tech (2014b) and shown on Figure 3. AOC 7 is located in the northwestern portion of former Plant B-1 within the 500- $\mu\text{g/L}$ PCE and 50- $\mu\text{g/L}$ TCE groundwater plume contours, and outside of the 1- $\mu\text{g/L}$ hexavalent chromium groundwater plume contour, as mapped by Tetra Tech (2014b) and shown on Figures 4, 5, and 7.

6.7.2 Results of the Current Investigation

One boring, AOC7-1, was advanced in the vicinity of former Clarifier B-1-ZC to a depth of 150 feet bgs, and one boring, AOC7-2, was advanced in the vicinity of the former degreaser to a depth of 135 feet bgs. The locations of the borings are shown on Figures 8 and 17. Soil samples were collected at 5-foot intervals to total depth for logging soil lithology. Total chromium and hexavalent chromium analyses were performed at a rate of one per 10 feet. Total chromium was detected at concentrations ranging from 2.65 to 21.2 mg/kg in boring AOC7-1, and from 4.10 to 65.0 mg/kg in boring AOC7-2. Hexavalent chromium was not detected in the samples collected from boring AOC7-1 (less than 0.10 mg/kg). Hexavalent chromium was detected in all soil samples collected from boring AOC7-2, at concentrations ranging from 0.627 to 10.5 mg/kg.

All soil samples were screened with a PID. The PID readings ranged from 0.0 to 26.5 ppm in boring AOC7-1, and from 1.2 to 23.5 ppm in boring AOC7-2. In accordance with the approved work plan and subsequent Regional Board correspondence, no samples were submitted for VOC analyses and soil-gas probes were not installed since none of the PID readings exceeded 50-ppm field screening criteria.

6.7.3 Adequacy of Delineation

The vertical extent of hexavalent chromium migration has not been determined deeper than 135 feet bgs in the boring AOC7-2 within AOC 7. Additionally, the horizontal extent of hexavalent chromium in soil has not been determined.

The PID readings from both borings in AOC 7 were below the screening criteria of 50 ppm. Therefore, there do not appear to be ongoing VOC impacts that require additional delineation.

6.7.4 Potential for Impact to Groundwater

Based on data collected as part of this investigation, it does not appear that activities associated with former Clarifier B-1-ZC represent a potential ongoing or future source of hexavalent chromium in soil or to groundwater. There is potential for hexavalent chromium impact to groundwater at the location of the former degreaser characterized by boring AOC7-2. Hexavalent chromium was detected at a depth of 135 feet, approximately 35 feet above the water table (based on April 2014 groundwater levels [Tetra Tech, 2014b]), and the mass of hexavalent chromium is estimated to exceed the AHCAC. However, the area overlying the footprint of the former degreaser is paved with asphalt-concrete, reducing the chance of rainwater infiltration, and thereby reducing the potential for hexavalent chromium to be mobilized.

Based on site data, it does not appear that activities associated with former Clarifier B-1-ZC nor the former degreaser represent a significant potential ongoing or future source of VOCs in soil or to groundwater.

6.8 AOC 8 AND AOC 9 – PLANT B-1 FORMER BURIED WASTE AREA

The Abandoned Waste Disposal Site (AWDS) was located in the southeast corner of the former Plant B-1 facility. Portions of the AWDS encompassed the area south and east of former Building 149 and former Buildings 194, 195, and 196. This area was believed to have been used as a disposal site for paint sludge, solvents, construction debris, and general manufacturing waste generated at the plant in the 1940s. Currently, portions of the AWDS (including former Buildings 194 and 195) are overlain by an unoccupied commercial building and the soil-vapor extraction (SVE) system treatment plant. The remaining areas are covered by the associated asphalt-paved parking lot.

6.8.1 Geology and Hydrogeology within AOC 8 and AOC 9

Based on the results of the current investigation and review of boring logs from nearby borings, AOC 8 and AOC 9 are underlain by interbedded silty sand, sand, sand with gravel and cobbles, and sandy silt to depths of at least 60 feet bgs, as presented on Figure 18. In April 2014, the depth to groundwater beneath AOC 8 and AOC 9 was approximately 130 to 145 feet as mapped by Tetra Tech (2014b) and shown on Figure 3. These areas of concern are located in the southeastern portion of former Plant B-1 within the 5- μ g/L PCE, 5- to 50- μ g/L TCE, and 1- μ g/L hexavalent chromium groundwater plume contours, as mapped by Tetra Tech (2014b) and shown on Figures 4, 5, and 7.

6.8.2 Results of the Current Investigation

Four borings were advanced within the AWDS to depths of 60 feet bgs. The locations of the borings are shown on Figures 8 and 18. Soil samples were collected at 5-foot intervals to total depth for logging soil lithology. Total chromium and hexavalent chromium analyses were performed at a rate of one per 10 feet. Samples from the finest-grained unit encountered in each 10-foot interval were selected for analysis. Total chromium was detected at concentrations ranging from 3.71 to 461 mg/kg. Hexavalent chromium was detected in 16 of 27 soil samples at concentrations ranging from 0.338 to 32.0 mg/kg. Hexavalent chromium was not detected in the remaining samples (less than 0.10 mg/kg).

All soil samples were screened with a PID. The PID readings ranged from 0.0 to 2.1 ppm. In accordance with the approved work plan, no samples were submitted for VOC analyses and soil-gas probes were not installed since none of the photo ionization detector readings exceeded the 50-ppm field screening criteria.

6.8.3 Adequacy of Delineation

The vertical extent of hexavalent chromium migration has not been determined deeper than 60 feet bgs in the four borings within AOC 8 or AOC 9. Additionally, the horizontal extent of hexavalent chromium in soil has not been determined.

The PID readings from all borings in AOC 8 and AOC 9 were below the screening criteria of 50 ppm. Therefore, there do not appear to be ongoing VOC impacts that require additional delineation in the locations tested as part of this investigation.

6.8.4 Potential for Impact to Groundwater

There is potential for hexavalent chromium impacts to groundwater at boring AOC8/9-1. The vertical extent of hexavalent chromium migration has not been investigated below 60 feet bgs, which is estimated to be more than 100 feet above the water table based on April 2014 groundwater levels (Tetra Tech, 2014b).

There is potential for hexavalent chromium impacts to groundwater at borings AOC8/9-2 and AOC8/9-3. The vertical extent has not been investigated below 60 feet at either location. The estimated masses of hexavalent chromium at depths less than 60 feet are less than in AOC8/9-1, but they are greater than observed in AOC7-2, which had hexavalent chromium detections down to 135 feet bgs.

There is potential for hexavalent chromium impacts to groundwater at boring AOC8/9-4. The vertical extent has not been investigated below 60 feet. The observed mass of hexavalent chromium in boring AOC8/9-4 is less than the other borings in AOC8/9, and less than observed in AOC7-2 above 60 feet bgs.

Although there is potential for hexavalent chromium impacts based on the AHCAC study, the majority of the former AWS is paved with asphalt-concrete and/or Portland-cement concrete. This reduces the chance of rainwater infiltration, and thereby reducing the potential for hexavalent chromium to be mobilized.

Based on data collected as part of this investigation, it does not appear that activities associated with the former buried waste area represent a significant potential ongoing or future source of VOCs in soil or to groundwater.

6.9 AOC 11 – PLANT B-6 BUILDING 371 FORMER CHROMIUM PASSIVATION AREA

The former plating line and dip tank line (CPL-1) and former Zyglo Processing System are located immediately east of the current Starz building. The locations of the former features are currently overlain by an asphalt-paved parking lot.

6.9.1 Geology and Hydrogeology within AOC 11

Based on the results of the current investigation and review of boring logs from nearby borings, AOC 11 is underlain by sand from approximately 0 to 22 feet bgs, sand with gravel from 22 to 27 feet bgs, sand from 27 to 53 feet bgs, sand with gravel and cobbles from 53 to 62 feet bgs, sand from 62 to 75 feet bgs, sand with gravel and cobbles from 75 to 87 feet bgs, sand from 87 to 92 feet bgs, and sand with gravel and cobbles from 92 to at least 100 feet bgs, as presented on Figure 19. In April 2014, the depth to groundwater beneath AOC 11 was approximately 220 feet, as mapped by Tetra Tech (2014b) and shown on Figure 3. This AOC is located in the eastern portion of former Plant B-6 within the 5- μ g/L PCE, 5- μ g/L TCE groundwater plume contours, and outside of the 1- μ g/L hexavalent chromium groundwater plume contour, as mapped by Tetra Tech (2014b) and shown on Figures 4, 5, and 7.

6.9.2 Results of the Current Investigation

One boring, AOC11-1R, was advanced in the vicinity of the former plating line to a depth of 100 feet bgs, and one boring, AOC11-2, was advanced in the vicinity of the removal area associated with the Zyglo system in the location of the highest historical hexavalent chromium detection. Both borings were advanced to a depth of 100 feet bgs. The locations of the borings are shown on Figures 9 and 19. Soil samples were collected at 5-foot intervals to total depth for logging soil lithology. Total chromium and hexavalent chromium analyses were performed at a rate of one per 10 feet. Total chromium was detected at concentrations ranging from 2.47 to 18.4 mg/kg in boring AOC11-1R, and from 2.88 to 11.7 mg/kg in boring AOC7-2. Hexavalent chromium was detected in five soil samples collected from boring AOC11-1R, at concentrations ranging from 0.426 to 1.83 mg/kg. Hexavalent chromium was detected in two soil samples collected from boring AOC11-2, at concentrations of 0.646 and 0.871 mg/kg, collected at 30 feet and 35 feet bgs, respectively. Hexavalent chromium was not detected in the remaining samples (less than 0.10 mg/kg).

All soil samples were screened with a PID. The PID readings ranged from 0.8 to 31.2 ppm in boring AOC11-1R, and from 0.1 to 6.2 ppm in boring AOC11-2. In accordance with the approved work plan and subsequent Regional Board correspondence, no samples were submitted for VOC analyses and soil-gas probes were not installed since none of the PID readings exceeded the 50-ppm field screening criteria.

6.9.3 Adequacy of Delineation

The borings advanced as part of this investigation appear to have adequately delineated the depth of hexavalent chromium in soil at the specific features included in the investigation. In addition, the historical borings appear to have adequately delineated the horizontal extent of hexavalent chromium in soil as well.

PID readings in both borings were below the screening criteria of 50 ppm. Therefore, based on the data collected as part of this investigation, there does not appear to be the need for additional delineation of VOC impacts at the specific features investigated as part of this investigation.

6.9.4 Potential for Impact to Groundwater

The potential for hexavalent chromium impacts to groundwater near borings AOC11-1R and AOC11-2 are low. The mass of hexavalent chromium detected in boring AOC11-1 and AOC11-2 are low, and the available hexavalent chromium attenuation capacity (AHCAC) below the depth of greatest observed migration greatly exceeds the mass of hexavalent chromium, even if 100% of the hexavalent chromium were mobile. The potential for this hexavalent chromium to impact the groundwater is low.

Based on the data reviewed as part of this investigation, it appears the activities associated with the former Building 371 chromium passivation area and the Zyglo system removal area do not represent a significant potential ongoing or future source of VOCs in soil or to groundwater.

6.10 AOC 12 – PLANT B-6 BUILDING 357 SEEPAGE PITS

The former Building 357 seepage pits (DW-1 and DW-2) are located in a lot currently used for storage of trucks. The locations of the former seepage pits are currently overlain by an asphalt-paved parking lot.

6.10.1 Geology and Hydrogeology within AOC 12

Based on the results of the current investigation and review of boring logs from nearby borings, AOC 12 is underlain by sand from 0 to 42 feet bgs, sand with gravel and cobbles from 42 to 57 feet bgs, sand from 57 to 82 feet bgs, and interbedded sand and sand with gravel from 82 to at least 100 feet bgs, as presented on Figure 20. There may be more scattered, thin, fine-grained interbeds within the sand, but the boring logs indicate that fine-grained units are not extensive or continuous. In April

2014, the depth to groundwater beneath AOC 12 was approximately 250 feet, as mapped by Tetra Tech (2014b) and shown on Figure 3. This AOC is located in the northwest portion of former Plant B-6 outside of the 1- μ g/L hexavalent chromium groundwater plume contour, as mapped by Tetra Tech (2014b) and shown on Figure 7.

6.10.2 Results of the Current Investigation

One boring, AOC12-1, was advanced in the vicinity of the former features to a depth of 100 feet bgs. The location of the boring is shown on Figures 9 and 20. Soil samples were collected at 5-foot intervals to total depth for logging soil lithology. Total chromium and hexavalent chromium analyses were performed at a rate of one per 10 feet. Total chromium was detected at concentrations ranging from 2.49 to 11.0 mg/kg. Hexavalent chromium was not detected in the samples (less than 0.10 mg/kg).

6.10.3 Adequacy of Delineation

Hexavalent chromium was not detected in the samples tested from boring AOC12-1. Therefore, there do not appear to be hexavalent chromium impacts that require additional delineation.

6.10.4 Potential for Impact to Groundwater

Based on site data, there is no evidence that activities associated with the Building 357 seepage pits represent a potential ongoing or future source of hexavalent chromium in soil or to groundwater.

6.11 AOC 13 – PLANT B-6 BUILDING 353 DRY WELLS AND CLARIFIER B-6-F

The former Building 353 dry wells (DW-3 through DW-5) and clarifier B-6-F are located in a lot just south of Hertz Entertainment Services on Bob Hope Airport property. The location of the former dry well is overlain by dirt with sparse native vegetation.

6.11.1 Geology and Hydrogeology within AOC 13

Based on the results of the current investigation and review of boring logs from nearby borings, AOC 13 is underlain by sand with varying amounts of gravel from 0 to 90 feet bgs (with local silty sand interbeds from 52 to 57 feet and 67 to 77 feet bgs) and silty sand from 90 to at least 100 feet bgs, as presented on Figure 21. There may be more scattered, thin, fine-grained interbeds within the sand, but the boring logs indicate that fine-grained units are not extensive or continuous.

In April 2013, the depth to groundwater beneath AOC 13 was approximately 240 feet, as mapped by Tetra Tech (2014b) and shown on Figure 3. This AOC is located in the northern portion of former Plant B-6 outside of the 1- $\mu\text{g/L}$ hexavalent chromium groundwater plume contour, as mapped by Tetra Tech (2014b) and shown on Figure 7.

6.11.2 Results of the Current Investigation

One boring, AOC13-1, was advanced in the vicinity of former dry wells DW-4 and DW-5 to a depth of 100 feet bgs, and one boring, AOC13-2, was advanced in the vicinity of former dry well DW-3 to a depth of 100 feet bgs. The locations of the borings are shown on Figures 9 and 21. Soil samples were collected at 5-foot intervals to total depth for logging soil lithology. Total chromium and hexavalent chromium analyses were performed at a rate of one per 10 feet. Total chromium was detected at concentrations ranging from 2.85 to 28.1 mg/kg in boring AOC13-1, and from 2.30 to 8.09 mg/kg in boring AOC13-2. Hexavalent chromium was detected in two soil samples collected from boring AOC13-1, at concentrations of 0.645 and 0.530 mg/kg, collected at 20 feet and 25 feet bgs, respectively. Hexavalent chromium was detected in one soil sample collected from boring AOC13-2, at a concentration of 0.396 mg/kg, collected at 85 feet bgs. Hexavalent chromium was not detected in the remaining samples (less than 0.10 mg/kg).

6.11.3 Adequacy of Delineation

The vertical extent of hexavalent chromium migration appears to have been adequately determined at AOC 13, and the relatively low levels of hexavalent chromium detected do not require additional horizontal delineation.

6.11.4 Potential for Impact to Groundwater

The potential for future hexavalent chromium impacts to groundwater at the locations of AOC13-1 and AOC13-2 are low. The deepest detection of hexavalent chromium in boring AOC13-1 was at 25 feet bgs and the single detection (0.396 mg/kg) of hexavalent chromium in boring AOC13-2 was at 85 feet bgs. The depth to water is estimated to be approximately 240 feet bgs based on April 2014 groundwater levels (Tetra Tech, 2014b).

The mass of hexavalent chromium detected in boring AOC13-1 is low, and the available hexavalent chromium attenuation capacity (AHCAC) below the depth of greatest observed migration greatly

exceeds the mass of hexavalent chromium, even if 100% of the hexavalent chromium were mobile. The potential for this hexavalent chromium to impact the groundwater is low.

It is unlikely that future migration would reach the water table at AOC13-2. Although the data from the boring did not conclusively determine the vertical extent of contamination, the mass of hexavalent chromium observed in the boring is likely to be too low to exceed the AHCAC below the depth of the boring.

6.12 AOC 14 – PLANT B-6 BUILDING 340 DRY WELL

The former Building 340 dry well (DW-8) is located west of Hollywood Way on Bob Hope Airport property. The location of the former dry well is overlain by dirt with sparse native vegetation.

6.12.1 Geology and Hydrogeology within AOC 14

Based on the results of the current investigation and review of boring logs from nearby borings, AOC 14 is underlain by sand from 0 to 67 feet bgs, sand with gravel and cobbles from 67 to 97 feet bgs, and sand from 97 to at least 100 feet bgs, as presented on Figure 22. There may be scattered, thin, fine-grained interbeds within the sand, but the boring logs indicate that fine-grained units are not extensive or continuous. In April 2014, the depth to groundwater beneath AOC 14 was approximately 230 feet, as mapped by Tetra Tech (2014b) and shown on Figure 3. This AOC is located in the central portion of former Plant B-6 outside of the 1- μ g/L hexavalent chromium groundwater plume contour, as mapped by Tetra Tech (2014b) and shown on Figure 7.

6.12.2 Results of the Current Investigation

One boring, AOC14-1, was advanced in the vicinity of the former features to a depth of 100 feet bgs. The location of the boring is shown on Figures 9 and 22. Soil samples were collected at 5-foot intervals to total depth for logging soil lithology. Total chromium and hexavalent chromium analyses were performed at a rate of one per 10 feet. Total chromium was detected at concentrations ranging from 2.49 to 41.1 mg/kg. Hexavalent chromium was not detected in the samples (less than 0.10 mg/kg).

6.12.3 Adequacy of Delineation

Hexavalent chromium was not detected in the samples tested from borehole AOC14-1. Therefore, there do not appear to be hexavalent chromium impacts that require additional delineation.

6.12.4 Potential for Impact to Groundwater

Based on site data, there is no evidence that activities associated with the Building 340 dry well represent a potential ongoing or future source of hexavalent chromium in soil or to groundwater.

6.13 AOC 15 – PLANT B-6 BUILDINGS 332-333 SEEPAGE PITS

The former Buildings 332-333 seepage pits are located west of Hollywood Way on Bob Hope Airport property. The locations of the former seepage pits are overlain by an asphalt-paved empty lot.

6.13.1 Geology and Hydrogeology within AOC 15

Based on the results of the current investigation and review of boring logs from nearby borings, AOC 15 is underlain by sand from 0 to 17 feet bgs, silty sand from 17 to 22 feet bgs, sand from 22 to 57 feet bgs, interbedded sand and sand with gravel and cobbles from 57 to 92 feet bgs, and silty sand from 92 to at least 1000 feet bgs, as presented on Figure 23. There may be more scattered, thin, fine-grained interbeds within the sand, but the boring logs indicate that fine-grained units are not extensive or continuous. In April 2014, the depth to groundwater beneath AOC 15 was approximately 225 feet, as mapped by Tetra Tech (2014b) and shown on Figure 3. This AOC is located in the northern portion of former Plant B-6 outside of the 1- μ g/L hexavalent chromium groundwater plume contour, as mapped by Tetra Tech (2014b) and shown on Figure 7.

6.13.2 Results of the Current Investigation

One boring, AOC15-1, was advanced in the vicinity of the former features to a depth of 100 feet bgs. The location of the boring is shown on Figures 9 and 23. Soil samples were collected at 5-foot intervals to total depth for logging soil lithology. Total chromium and hexavalent chromium analyses were performed at a rate of one per 10 feet. Total chromium was detected at concentrations ranging from 1.60 to 22.1 mg/kg. Hexavalent chromium was not detected in the samples (less than 0.10 mg/kg).

6.13.3 Adequacy of Delineation

Hexavalent chromium was not detected in the samples tested from borehole AOC15-1. Therefore, there do not appear to be hexavalent chromium impacts that require additional delineation.

6.13.4 Potential for Impact to Groundwater

Based on site data, there is no evidence that activities associated with the Building 332-333 seepage pits represent a potential ongoing or future source of hexavalent chromium in soil or to groundwater.

6.14 AOC 16 – PLANT B-6 BUILDING 310 METAL FINISHING LINES, SUMP, AND SAND TRAPS

The Building 310 metal finishing lines, sump, and sand traps are located west of Hollywood Way on Bob Hope Airport property. The locations of the former features are overlain by dirt with sparse native vegetation.

6.14.1 Geology and Hydrogeology within AOC 16

Based on the results of the current investigation and review of boring logs from nearby borings, AOC 16 is underlain by interbedded sand and sand with gravel and cobbles, as presented on Figure 24. There are scattered, thin, fine-grained interbeds of silty sand within the coarser-grained units, but the boring logs indicate that fine-grained units are not extensive or continuous. In April 2014, the depth to groundwater beneath AOC 16 was approximately 220 feet, as mapped by Tetra Tech (2014b) and shown on Figure 3. This AOC is located in the southern portion of former Plant B-6 outside of the 1- $\mu\text{g/L}$ hexavalent chromium groundwater plume contour, as mapped by Tetra Tech (2014b) and shown on Figure 7.

6.14.2 Results of the Current Investigation

One boring, AOC16-1, was advanced in the vicinity of former metal finishing line CPL-3 and Sand Trap 4 to a depth of 100 feet bgs, and one boring, AOC16-2, was advanced in the vicinity of the former metal finishing line CPL-4 and Sand Trap 5 to a depth of 100 feet bgs. The locations of the boring are shown on Figures 9 and 24. Soil samples were collected at 5-foot intervals to total depth for logging soil lithology. Total chromium and hexavalent chromium analyses were performed at a rate of one per 10 feet. Total chromium was detected at concentrations ranging from 2.92 to 23.9 mg/kg in boring AOC16-1, and from 3.01 to 11.06 mg/kg in boring AOC16-2. Hexavalent chromium was not detected in any of the samples (less than 0.10 mg/kg).

6.14.3 Adequacy of Delineation

Hexavalent chromium was not detected in any historic or contemporary borings. Therefore, there do not appear to be hexavalent chromium impacts that require additional delineation.

6.14.4 Potential for Impact to Groundwater

Based on site data, there is no evidence that activities associated with the Building 310 metal finishing lines and sand traps represent a potential ongoing or future source of hexavalent chromium in soil or to groundwater.

6.15 AOC 17 – PLANT B-6 BUILDING 88 SEEPAGE PITS

The former Building 88 seepage pits (DW-6 and DW-7) are located in a lot currently used for storage of trucks. The location of the former dry wells is currently overlain by an asphalt-paved parking lot.

6.15.1 Geology and Hydrogeology within AOC 17

Based on the results of the current investigation and review of boring logs from nearby borings, AOC 17 is underlain by interbedded sand and sand with gravel and cobbles from 0 to 97 feet bgs, and silty sand from 97 to at least 100 feet bgs, as presented on Figure 25. There are scattered, thin, fine-grained interbeds of silty sand within the coarser-grained units, but the boring logs indicate that fine-grained units are not extensive or continuous. In April 2014, the depth to groundwater beneath AOC 17 was approximately 240 feet, as mapped by Tetra Tech (2014b) and shown on Figure 3. This AOC is located in the northern portion of former Plant B-6 outside of the 1- μ g/L hexavalent chromium groundwater plume contour, as mapped by Tetra Tech (2014b) and shown on Figure 7.

6.15.2 Results of the Current Investigation

One boring, AOC17-1, was advanced in the vicinity of former seepage pit DW-6 to a depth of 100 feet bgs, and one boring, AOC17-2, was advanced in the vicinity of former seepage pit DW-7 to a depth of 100 feet bgs. The locations of the boring are shown on Figures 9 and 25. Soil samples were collected at 5-foot intervals to total depth for logging soil lithology. Total chromium and hexavalent chromium analyses were performed at a rate of one per 10 feet. Total chromium was detected at concentrations ranging from 3.35 to 9.67 mg/kg in boring AOC17-1, and from 2.89 to 30.3 mg/kg in boring AOC17-2. Hexavalent chromium was not detected in any of the samples (less than 0.10 mg/kg).

6.15.3 Adequacy of Delineation

Hexavalent chromium was not detected in the samples tested from boreholes AOC17-1 or AOC17-2. Therefore, there do not appear to be hexavalent chromium impacts that require additional delineation.

6.15.4 Potential for Impact to Groundwater

Based on site data, there is no evidence that activities associated with the Building 88 seepage pits represent a potential ongoing or future source of hexavalent chromium in soil or to groundwater.

6.16 AOC 18 – PLANT B-6 BUILDING 83 CLARIFIER, SUMPS, AND SAND TRAPS

The former Building 83 clarifier is located in an asphalt-paved lot currently used for storage of trucks. The former Building 83 sumps and sand traps are located on Bob Hope Airport property to the south, and are overlain by dirt with sparse native vegetation.

6.16.1 Geology and Hydrogeology within AOC 18

Based on the results of the current investigation and review of boring logs from nearby borings, AOC 18 is underlain by silty sand from 0 to 10 feet bgs, and interbedded sand and sand with gravel and cobbles from 10 to at least 100 feet bgs, as presented on Figure 26. There are scattered, thin, fine-grained silty sand interbeds within the sand, but the boring logs indicate that fine-grained units are not extensive or continuous. In April 2014, the depth to groundwater beneath AOC 18 was approximately 230 feet, as mapped by Tetra Tech (2014b) and shown on Figure 3. This AOC is located in the central portion of former Plant B-6 outside of the 1- μ g/L hexavalent chromium groundwater plume contour, as mapped by Tetra Tech (2014b) and shown on Figure 7.

6.16.2 Results of the Current Investigation

One boring, AOC18-1, was advanced in the vicinity of the clarifier, one boring, AOC18-2, was advanced in the vicinity of the sump and Sand Trap 2, and one boring, AOC18-3, was advanced in the vicinity of the former sump and Sand Trap 3. All borings were advanced to a depth of 100 feet bgs. The locations of the borings are shown on Figures 9 and 26. Soil samples were collected at 5-foot intervals to total depth for logging soil lithology. Total chromium and hexavalent chromium analyses were performed at a rate of one per 10 feet. Total chromium was detected at concentrations

ranging from 2.10 to 11.2 mg/kg in boring AOC18-1, from 2.14 to 12.7 mg/kg in boring AOC18-2, and from 2.57 to 10.1 mg/kg in boring AOC18-3. Hexavalent chromium was not detected in any of the samples (less than 0.10 mg/kg).

6.16.3 Adequacy of Delineation

Hexavalent chromium was not detected in any historic or contemporary borings. Therefore, there do not appear to be hexavalent chromium impacts that require additional delineation.

6.16.4 Potential for Impact to Groundwater

Based on site data, there is no evidence that activities associated with the Building 83 clarifier, sumps, and sand traps represent a potential ongoing or future source of hexavalent chromium in soil or to groundwater.

6.17 AOC 19 – PLANT B-6 BUILDING 82 METAL FINISHING PROCESS LINE, SUMP, SAND TRAP, AND PITS

The former Building 82 metal finishing process line area is located in a lot currently used for storage of trucks. The location of the former features (which include a former metal processing line, a sand trap, a sump, and pits) is currently overlain by an asphalt-paved parking lot.

6.17.1 Geology and Hydrogeology within AOC 19

Based on the results of the current investigation and review of boring logs from nearby borings, AOC 19 is underlain interbedded sand and sand with gravel and cobbles to at least 100 feet bgs, as presented on Figure 27. There are scattered, thin, fine-grained silty sand interbeds within the sand, but the boring logs indicate that fine-grained units are not extensive or continuous. In April 2014, the depth to groundwater beneath AOC 19 was approximately 235 feet, as mapped by Tetra Tech (Tetra Tech, 2014b) and shown on Figure 3. This AOC is located in the central portion of former Plant B-6 outside of the 1- μ g/L hexavalent chromium groundwater plume contour, as mapped by Tetra Tech (2014b) and shown on Figure 7.

6.17.2 Results of the Current Investigation

One boring, AOC19-1, was advanced in the vicinity of former Sand Trap 1 to a depth of 100 feet bgs, and one boring, AOC19-2, was advanced in the vicinity of the former sump and the metal finishing line/Pit 2 to a depth of 100 feet bgs. The locations of the borings are shown on

Figures 9 and 27. Soil samples were collected at 5-foot intervals to total depth for logging soil lithology. Total chromium and hexavalent chromium analyses were performed at a rate of one per 10 feet. Total chromium was detected at concentrations ranging from 2.06 to 8.94 mg/kg in boring AOC19-1, and from 3.13 to 111 mg/kg in boring AOC19-2. Hexavalent chromium was not detected in any of the samples (less than 0.10 mg/kg).

6.17.3 Adequacy of Delineation

Hexavalent chromium was not detected in the samples tested from boreholes AOC19-1 or AOC19-2. Therefore, there do not appear to be hexavalent chromium impacts that require additional delineation.

6.17.4 Potential for Impact to Groundwater

Based on site data, there is no evidence that activities associated with the Building 82 metal finishing process line, sump, sand trap, and pits represent a potential ongoing or future source of hexavalent chromium in soil or to groundwater.

6.18 AOC 20 – PLANT C-1 LEACH FIELDS AND BUILDING 50 DRY WELL

The Building 50 dry well are located immediately west of the current Atlantic Aviation building. The two former leach fields are located immediately west and southwest of the current Atlantic Aviation building. The locations of the former features are overlain by a vacant dirt-covered lot and/or concrete within Bob Hope Airport property.

6.18.1 Geology and Hydrogeology within AOC 20

Based on the results of the current investigation and review of boring logs from nearby borings, AOC 20 is underlain by silty sand from 0 to 8 feet bgs and sand from 8 to at least 100 feet bgs, as presented on Figure 28. There are scattered, thin, fine-grained interbeds of silty sand within the sand, but the boring logs indicate that fine-grained units are not extensive or continuous. In April 2014, the depth to groundwater beneath AOC 20 was approximately 240 feet, as mapped by Tetra Tech (2014b) and shown on Figure 3. This AOC is outside of the 1- μ g/L hexavalent chromium groundwater plume contour, as mapped by Tetra Tech (2014b) and shown on Figure 7.

6.18.2 Results of the Current Investigation

One boring, AOC20-1, was advanced in the vicinity of the Building 50 dry well to a depth of 100 feet bgs, and one boring, AOC20-2, was advanced in the vicinity of the former leach field to the southeast of Building 43 to a depth of 100 feet bgs. The locations of the borings are shown on Figures 9 and 28. Soil samples were collected at 5-foot intervals to total depth for logging soil lithology. Total chromium and hexavalent chromium analyses were performed at a rate of one per 10 feet. Total chromium was detected at concentrations ranging from 2.37 to 7.30 mg/kg in boring AOC20-1, and from 2.99 to 10.5 mg/kg in boring AOC20-2. Hexavalent chromium was not detected in any of the samples (less than 0.10 mg/kg).

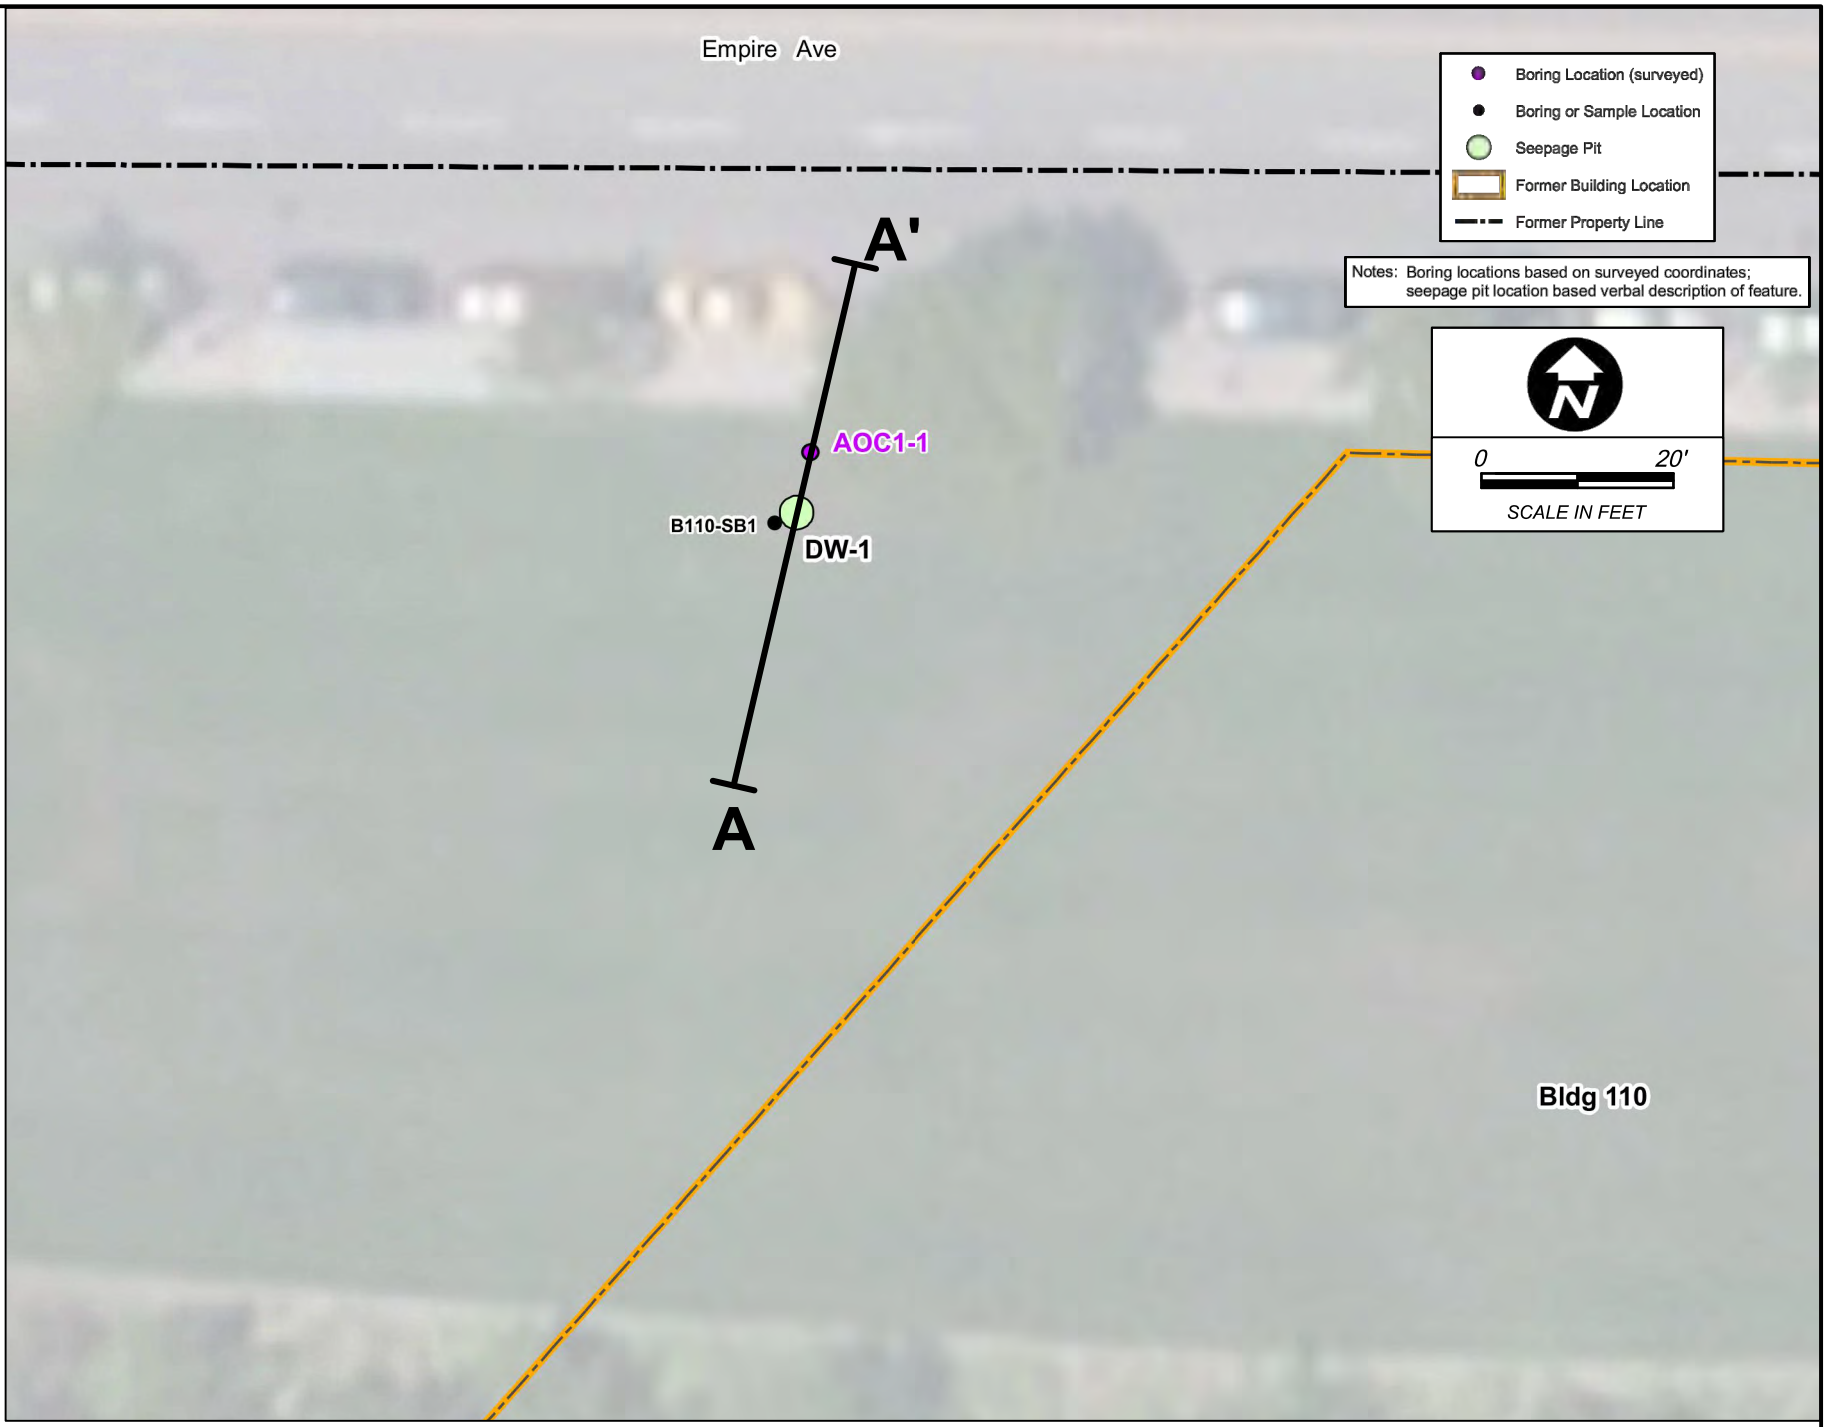

6.18.3 Adequacy of Delineation

Hexavalent chromium was not detected in any historic or contemporary borings. Therefore, there do not appear to be hexavalent chromium impacts that require additional delineation.

6.18.4 Potential for Impact to Groundwater

Based on site data, there is no evidence that activities associated with the Building 50 dry well and the former leach field represent a potential ongoing or future source of hexavalent chromium in soil or to groundwater.

Section 7

CONCLUSIONS AND RECOMMENDATIONS

In compliance with the California Water Code Section 13267 Order No. R4-2013-0063 (the Order) and in accordance with a Regional Water Quality Control Board, Los Angeles (Regional Board)-approved work plan, 30 soil borings were drilled and sampled at 19 areas of concern (AOCs) to delineate the extent of volatile organic compounds (VOCs) and hexavalent chromium in the subsurface soil that may have originated from the former Lockheed Martin Corporation (Lockheed Martin) facilities specified in the Order. The work plan outlined the investigation of former features at 19 areas of concern (AOCs) at former Plants B-1, B-6, and C-1 be investigated for hexavalent chromium and eight of the AOCs be investigated for VOCs.

The Order required the investigation of VOCs at AOCs 2, 4 through 9, and AOC 11. Both the need for soil analyses for VOCs and the installation of soil gas probes were to be determined in the field by screening criteria established in the approved work plan. None of the samples screened in the field exceeded the established criteria. Therefore, no soil samples were tested for VOCs and no soil gas probes were installed. Based on the data collected and analyzed as part of this investigation, none of the features within the eight AOCs specified for VOC investigation appear to represent a significant potential source of VOCs in soil or to groundwater.

Total chromium was detected in all the samples tested from all 30 borings completed at the 19 AOCs. Hexavalent chromium was detected in 10 of the 30 borings that were completed within 6 of the 19 AOCs investigated. The potential for attenuation of hexavalent chromium was evaluated at various locations across the three former Lockheed plants sampled as part of this investigation. Locations both with and without hexavalent chromium impacts were included in the attenuation testing. The testing included geotechnical, geochemical, synthetic precipitation leaching procedure (SPLP), and available hexavalent chromium attenuation capacity (AHCAC) testing. The evaluation of the data from the borings indicates the following:

- Only soil samples from borings located in AOCs 2, 7, 8/9, 11, and 13 contained samples that had detected hexavalent chromium.

-
- The soils have the capacity to cause the chemical reduction of hexavalent chromium to trivalent chromium which would be followed by precipitation of the trivalent chromium to a low-solubility solid phase, resulting in attenuation of the hexavalent chromium.
 - The low concentrations of hexavalent chromium in soils combined with the attenuation capacity for limiting the further migration of hexavalent chromium appears to be sufficient at AOCs 2, 11, and 13 to prevent the detected hexavalent chromium from migrating to the water table.
 - The delineation of AOCs 7, 8, and 9 does not appear to be complete and the attenuation capacity may be insufficient to prevent the migration of the detected hexavalent chromium to the water table.

Based on the data collected and the analysis performed the specified features formerly located within each of the following 16 AOCs have been adequately delineated and do not represent a significant potential ongoing or future source of VOCs and/or hexavalent chromium in soil or to groundwater:

- | | | |
|----------|------------|------------|
| 1. AOC 1 | 7. AOC 11 | 13. AOC 17 |
| 2. AOC 2 | 8. AOC 12 | 14. AOC 18 |
| 3. AOC 3 | 9. AOC 13 | 15. AOC 19 |
| 4. AOC 4 | 10. AOC 14 | 16. AOC 20 |
| 5. AOC 5 | 11. AOC 15 | |
| 6. AOC 6 | 12. AOC 16 | |

However, there is potential for hexavalent chromium impacts to groundwater in AOCs 7, 8, and 9 based upon the analyses provided in this report. The rate of water migration downward through the vadose zone has not been evaluated but the change in use of the properties and resulting changes in water-use practices has likely decreased the rate of water movement, and thus has reduced the potential for migration of hexavalent chromium, where present, vertically toward the water table. If any impacts to groundwater were to occur from these AOCs, immediately adjacent extraction wells (VO-1, VO-4, and VO-5) would capture the hexavalent chromium before further migration could take place (containment is verified in the annual and semiannual groundwater monitoring reports for the Burbank Operable Unit [BOU]; Tetra Tech, 2014b). Despite this fact, Lockheed Martin will discuss the need for additional soil and/or groundwater delineation efforts following the Regional Board assessment of the data and findings presented in this report. Future site characterization activities will then be described in work planning documents prepared for Regional Board review.

SUBJECT: COMMENTS RESPONSE LETTER FOR THE REPORT ENTITLED ADDITIONAL SITE INVESTIGATION REPORT PURSUANT TO CALIFORNIA WATER CODE SECTION 13267 ORDER R4-2013-0063

SITE: FORMER LOCKHEED MARTIN CORPORATION PLANTS A-1 NORTH LOCATED AT 2555 NORTH HOLLYWOOD WAY, BURBANK, CALIFORNIA (FILE NO. 104.5152); B-1 LOCATED AT 1705 VICTORY PLACE, BURBANK, CALIFORNIA (FILE NO. 104.0676); B-6 LOCATED AT 2801 NORTH HOLLYWOOD WAY, BURBANK, CALIFORNIA (FILE NO. 104.0674); AND C-1 LOCATED AT 10720 SHERMAN WAY, BURBANK, CALIFORNIA (FILE NO. 104.1343)

Dear Ms. Rosenstein:

On April 18, 2013 the California Regional Water Quality Control Board, Los Angeles (Regional Board) directed Lockheed Martin Corporation (LMC), in Order No. R4-2013-0063, to submit a technical report (Report). On December 29, 2014 the Regional Board received the Report entitled "*Additional Site Investigation Report Former Lockheed Martin Plants A-1 North, B-1, B-6, and C-1, Burbank, California,*" (Tetra Tech, December 2014).

SUMMARY OF REPORT

The scope of work (SOW) objectives of the investigation were to delineate the extent of certain waste constituents originating from the "Areas of Concern (AOCs)" identified in the 13267 Order (Order) and determine if the waste constituents posed a threat to groundwater quality. The technical approach used to achieve these objectives includes the following:

1. The completion of 30 soil borings to depths of 60 to 150 feet below ground surface (bgs) as specified in the Order;
2. The collection of soil samples for the analysis of total chromium (Cr) and hexavalent chromium (CrVI);

3. The collection of soil samples for analysis of volatile organic compounds (VOCs) if the VOCs field screening criteria established in the work plan were exceeded; and
4. Performed CrVI and VOC attenuation assessments to determine the probability of existing CrVI or VOCs migrating to the groundwater table.
5. Soil vapors were screened for VOCs using a hand-held, field photo ionization detector (PID).

The additional data obtained during the investigation, together with existing data and information was used to evaluate the potential groundwater well locations and characterize the potential for groundwater impacts originating from the features identified in the Order and work plan.

The major findings of the Report are:

The Report outlined the investigation of former features at 20 AOCs at former Plants B-1, B-6, and C-1 be investigated for CrVI and eight of the AOCs be investigated for VOCs. Specifically, the work plan presented the steps to investigate VOCs at AOCs 2, and 4 through 9, and AOC 11. Soil samples were to be collected and analyzed for VOCs and based on those results an evaluation would be made to determine the need for the installation of soil gas probes. Moreover, the need for the soil gas probes would be determined in the field by screening criteria established in the approved work plan. None of the samples screened in the field exceeded the established criteria in the approved work plan. Therefore, no soil samples were tested for VOCs and no soil gas probes were installed. Based on the data collected and analyzed as part of this investigation, one of the features within the eight AOCs specified for the VOC investigation appear to represent a significant potential source of VOCs in soil or to groundwater.

Total Cr was detected in soil samples collected from all 30 borings completed at the 20 AOCs, whereas CrVI was detected in 10 of the 30 borings that were completed of the 20 AOCs. The potential for attenuation of CrVI was evaluated at various locations across the three former Lockheed plants sampled as part of this investigation. Locations both with and without CrVI impacts were included in the attenuation testing. The testing included geotechnical, geochemical, synthetic precipitation leaching procedure (SPLP), and available CrVI attenuation capacity testing. The evaluation by LMC of the data from the borings indicates the following:

1. Only soil samples from borings located in AOCs 2, 7, 8, 9, 11, and 13 contained samples that have detectable concentrations of CrVI.
2. The soils have the capacity to cause the chemical reduction of CrVI to trivalent chromium which would be followed by precipitation of the trivalent chromium to a low-solubility solid phase, resulting in attenuation of the CrVI.
3. The low concentrations of CrVI in soils combined with the attenuation capacity for limiting the further migration of CrVI appears to be sufficient at AOCs 11, and 13 to prevent the detected CrVI from migrating to the water table.
4. The delineation of AOCs 7, 8, and 9 does not appear to be complete and the attenuation capacity may be insufficient to prevent the migration of the detected CrVI to the water table.

Based on the data collected and the analysis performed the specified features formerly located within each of the following 16 AOCs have been adequately delineated and do not represent a significant potential ongoing or future source of VOCs and/or CrVI in soil or to groundwater: AOC 1, -3, -5, -6, -9, -11, -12, -13, -14, -15, -16, -17, -18, -19, and -20.

However, there is potential for CrVI impacts to groundwater in AOCs-2, -4, -7, and -8 based upon the analyses provided in the Report. The rate of water migration downward through the vadose zone has not been evaluated but the change in use of the properties and resulting changes in water-use practices has likely decreased the rate of water movement, and thus has reduced the potential for migration of CrVI, where present, vertically toward the water table.

The Report proposes that LMC will discuss the need for additional soil and/or groundwater delineation efforts following the Regional Board's assessment of the data and findings presented in this report. Future site characterization activities will then be described in work planning documents prepared for Regional Board review.

REGIONAL BOARD COMMENTS AND ADDITIONS

The Regional Board considers the Report incomplete. The Report presents findings for each of the 20 AOCs. The Regional Board concurs that the site assessment activities for the soil, soil vapor, and groundwater have been completed for each of the AOCs except for AOC-2, 4, 7, and 8. You shall now complete the Report by submitting a work plan (work plan) to complete the additional site investigation by **October 15, 2015**.

To complete the required work plan, you shall respond to the following comments and additions:

1. The criteria used to determine whether VOCs in soils and soil vapor are misleading. Although a hand-held, field PID was used, the field instrument can produce erroneous results. A PID is typically used to qualitatively detect the presence of certain classes of VOCs such as aromatics (i.e., benzene, ethylbenzene, toluene, and xylenes, et. al.). The instrument is not very reliable for detecting chlorinated hydrocarbons such as trichloroethylene (TCE), perchloroethylene (PCE), et. al. unless the PID has been equipped with a long-life ionization lamp (11.7 or higher). Since it is not clear what type of lamp was used by LMC during the investigation, the conclusion that VOCs were not detected may be misleading. Additionally, during installation of soil borings, the soil cuttings brought to the surface were steaming (i.e., water vapor) due to the friction caused by the soil compaction and the drill being employed. The heat may have caused any VOCs in the soil samples to become volatilize and lost. Therefore, the conclusion that no soil samples needed to be collected and no soil vapor probes were needed to be installed is in error. LMC must present in a Technical Memorandum information regarding the type of PID used during the investigation. Moreover, LMC is required to provide a section in the work plan for the installation of the required soil vapor probes and the collection of soil vapor samples at AOCs 4, 5, 6, 7, and 8.
2. Provide the protocols to be used to construct the required groundwater monitoring wells. In addition you shall present the protocols for groundwater sample collection and analysis. Groundwater samples will be collected and analyzed for metals, CrVI, emerging chemicals, and

VOCs on a quarterly basis. This frequency will be conducted for one year at which time the groundwater data will be reviewed to determine the future sampling frequency and analytic list. The matrix table, which is provided as an attachment to this letter, will be used to determine which AOCs will be targeted for the construction of the groundwater monitoring wells.

3. The detection limit presented in the Executive Summary is not reported as micrograms per liter (ug/l) as stated in EPA Method 7199. It does not state whether the samples were prepared (i.e., extracted) prior to analysis. EPA Method 7199 is typically used for aqueous sample matrices and not for soil matrix samples. EPA Method 7196 is typically referenced to be used for soil samples analyses. LMC needs to discuss this methodology with the analytical laboratory and provide a written explanation to the Regional Board with the Technical Memorandum.
4. Executive Summary – The proposed use of SPLP does not seem appropriate for calculating the mobility of CrVI. The method states that prior to the filtration step for metals, the filter needs to be acid washed. When dealing with CrVI analyses, samples are not to be filtered prior to analysis nor are they preserved with acid as they are for other metals analysis. LMC is required to conduct additional research on the use of this method to determine the CrVI mobility and whether the use of acid washing is appropriate for this compound. This research needs to include examples where this method has proven to be acceptable for calculating CrVI mobility in various soil classifications. LMC needs to discuss this methodology with the analytical laboratory and provide a written explanation to the Regional Board with the Technical Memorandum.
5. Executive Summary – LMC is required to complete the groundwater assessment at AOC-2, -7 and -8. For the AOCs -9, -10 and -11, LMC needs to provide groundwater quality information based on data associated with the nearest groundwater monitoring wells to each of these AOCs. LMC needs to provide the information to the Regional Board with the Technical Memorandum.
6. Provide a transparent overlay of building footprints to be used to overlay each AOC for CrVI, VOCs, and emerging chemicals. The overlay for each AOC shall present the locations of the groundwater monitoring wells either located within or nearby and which ones are routinely sampled for CrVI, VOCs, and other emerging chemicals. The overlays can be provided in the Technical Memorandum.
7. The figures depicting chemical concentrations for each LMC facility (B-1, A-1, B-6, et. al.) shall be revised for CrVI, TCE, PCE, and Cr to depict the concentrations as bubble graphs or bubble charts. In addition, LMC is required to select at least one groundwater monitoring well representing each AOC and shall develop a stiff diagram for each well. If certain anions/cations are not available, then LMC will collect groundwater samples and analyze them for these constituents so the stiff diagrams can be developed. The information shall be provided in the Technical Memorandum.

8. Each contaminant plume map depicted in the figures section shall be revised so the plume is further outlined (thicker border lines). Each map shall be delineated downward to a depth of at least 250 bgs or to the depth of when the regional groundwater is encountered. The lowest concentration for each map shall be a regulatory standard such as the maximum contaminant level (MCL), public health goal (PHG), notification level (NL), etc. that is used to evaluate the contaminant's concentration. At a minimum a plume map shall be developed for TCE, PCE, CrVI, and Cr. The information shall be provided in the Technical Memorandum.
9. The plume maps for Cr and CrVI are not well defined; indicating not enough data has been collected and/or not enough wells are routinely sampled for CrVI and Cr. To determine whether data gaps exist, LMC shall develop an overlay of each plume and place the overlay over each of the 19 AOCs to compare each plume as it relates to each AOC. The information shall be provided in the Technical Memorandum.
10. LMC is required to provide a potential explanation as to the cause for the saturation zone at boring location AOC4-1 which was encountered approximately 136 to 137-feet bgs. The target depth for the boring was 150-feet. Groundwater levels have fallen significantly in Southern California due to the drought, and during the completion of the additional site investigation, the groundwater level at every other boring other than AOC4-1 was not encountered at the 136 to 137-feet bgs. The information shall be provided in the Technical Memorandum.
11. The United States Environmental Protection Agency (USEPA) regional screening level (RSL) for CrVI is 0.00067 milligram per kilogram (mg/kg). The use of ½ the analytical detection limit of 0.05 mg/kg limit to calculate the concentrations of CrIII vs. CrVI is confusing. The detection limit and ½ of the detection limit for CrVI is higher than the RSL, therefore the last sentence in the section is misleading. Based on a background study of actual CrVI soil sample results from sites located in the San Fernando Valley, the CrVI background concentration is non-detect (ND). Based on this study, the conclusion stated in the last sentence of the section shall be revised as appropriate. The information shall be provided in the Technical Memorandum.
12. Page 4 of the 13267 Order dated April 13, 2013 requires all reports submitted to the Regional Board shall have a perjury statement included as part of the report. The perjury statement must be signed by a senior authorized Lockheed representative. The perjury statement information shall be provided in the Technical Memorandum.
13. LMC shall provide information regarding the leachate concentration criterion to be used to evaluate and compare leachate contaminate results with the soil samples? Furthermore, LMC shall provide an explanation of why the SPLP methodology was not presented in the approved work plan. The information shall be provided in the Technical Memorandum.

As was previously stated, LMC shall now complete the Report by submitting a Technical Memorandum as an addendum to the Report and a work plan (work plan) to complete the additional site investigation by **November 13, 2015**.

The above requirement for submittal of a Report constitutes an amendment to the requirements of the California Water Code section 13267 Order originally dated April 18, 2013. All other aspects of the Order originally dated April 18, 2013, and the amendments thereto, remain in full force and effect. The required Report is necessary to investigate the characteristics of and extend of the discharges of waste at the site and to evaluate cleanup alternatives. Therefore, the burden, including costs, of the Report bear a reasonable relationship to the need for the Report and benefits to be obtained. Pursuant to section 13268 of the California Water Code, failure to submit the required Report by the specified due date may result in civil liability administratively imposed by the Regional Board in an amount up to one thousand dollars (\$1000) for each day each Report is not received.

If you have any questions, please contact Mr. Larry Moore via telephone at (213) 576-6730 or via email at lawrence.moore@waterboards.ca.gov.

Sincerely,

Samuel Unger, P.E.

1 INTRODUCTION

A geophysical investigation was conducted between June 11 and August 25, 1998 at the Burbank Airport/Lockheed B-6 facility, Burbank, California. The purpose of the investigation was to screen the accessible portions of the site for metallic pipes and utility cables, large underground storage tanks (USTs), and other large buried metallic objects.

The geophysical survey was conducted in an approximate 85-acre area at the site as shown in Figure 1. Geophysical equipment used during this investigation included a Geonics EM-31 terrain conductivity meter (EM-31) and a Geonics EM-61 digital metal detector (EM-61). Both instruments were used during this investigation because they have complimentary strengths and limitations. For example, the EM-31 can locate utility cables such as electrical lines that cannot typically be located the EM-61 due to the absence of significant amounts of metal. On the other hand the EM-61 can locate segmented metallic pipes, metallic pipes with insulated joints, and reinforced concrete pipes which often cannot be located with the EM-31. Unfortunately, neither instrument can locate nonmetallic pipes. The EM-31 is also not sensitive to very small metallic objects or debris, which can be an advantage at a site where there is a significant amount of scattered debris resulting from demolition activities. Both instruments respond strongly to buried metallic tanks.

The surface conditions at the site consisted of either asphalt or soil with occasional small concrete pads. Most of the soil-covered areas were the former locations of demolished structures or concrete pads and there was often scattered debris on the surface. The terrain in some of the soil-covered areas was quite rough with open excavations and debris piles, limiting access with the geophysical instruments. Demolition activities were being conducted during much of the geophysical survey and geophysical data was acquired around this activity as much as possible.

Geophysical techniques used during the investigation are discussed in Section 2. Field procedures are described in Section 3. Data processing and interpretation are discussed in Section 4. Conclusions derived from the geophysical survey are presented in Section 5, and our professional certification is presented in Section 6.

2 GEOPHYSICAL TECHNIQUES

This section presents background information on the geophysical methods used during this investigation.

2.1 Geonics EM-31 Terrain Conductivity Meter

The EM-31 is a frequency-domain EM induction instrument that operates at a frequency of 9.8 kHz. A photograph of the EM-31 can be found in the Technical Note on Geophysical Techniques for Shallow Environmental Investigations included as Appendix A. The EM-31 has a separate transmitter and receiver coil mounted at each end of a 12-foot long rigid boom. An alternating current is applied to the transmitter coil, causing the coil to radiate a primary EM field. This primary EM field generates eddy currents in subsurface materials, which give rise to a secondary EM field. The receiver coil measures the components of the secondary EM field both in-phase and 90-degrees out-of-phase (quadrature) with the primary field. The quadrature component is converted to units of apparent conductivity in millisiemens per meter (mS/m) and the in-phase component is recorded as parts per thousand of the primary field.

A negative EM-31 response with positive shoulders is generally observed over shallow, buried metallic objects such as pipes and tanks. When the instrument boom is orientated parallel to a long, linear conductor such as a pipe either a positive or negative response centered over the conductor is typically observed. The EM-31 can locate both ferrous and nonferrous metallic objects and can locate a 1000-gallon tank to a maximum depth of about 6-8 feet. Typically the EM-31 must pass directly over or immediately adjacent to a buried metallic object to detect it. Because the EM-31 measures conductivity it can also locate nonmetallic features with different electrical properties than native soils such as mud pits, backfilled excavations, etc.

Applications of EM induction methods include:

- Locating buried tanks and pipes
- Locating pits and trenches containing metallic and/or nonmetallic debris
- Delineating landfill boundaries
- Delineating oil production sumps and mud pits
- Mapping conductive soil and groundwater contamination
- Mapping soil salinity in agricultural areas
- Characterizing shallow subsurface geology
- Mapping buried channel deposits
- Locating sand and gravel deposits
- Mapping conductive fault and fracture zones
- Mapping lateral variation in subsurface soil type

Strengths of EM induction methods include:

- Rapid – data can be acquired at a slow walking pace
- Locate both metallic and some nonmetallic targets
- Not as sensitive to very small metallic objects and debris as other methods

- Can locate wire cables (i.e. electric and telephone lines) which cannot often be located by other methods
- Anomalies of buried objects have simple shape facilitating identification and positioning of the source

Limitations of EM Induction Methods include:

- Metallic structures such as buildings, fences, reinforced concrete, and light posts interfere with the measurements
- High voltage powerlines can often strongly interfere with the measurements
- Depth of investigation not as great as magnetometers for buried ferrous metallic objects
- Variable soil conductivity can complicate quadrature component interpretation

2.2 Geonics EM-61 Digital Metal Detector

The EM-61 is a high-resolution, deep sensing, time domain EM metal detector. A photograph of the Em-61 can be found in Appendix A. The EM-61 has a single transmitter and two receiver coils. The bottom coil is the transmitter during the current on-time and receiver during current off-time. The top-coil, mounted 40-cm above the bottom coil, is a receiver coil only. The transmitter and receiver electronics controls are mounted in a backpack and a hand-held data logger is used to store field measurements. During operation a half-duty cycle waveform is applied to the transmitter coil. During the off-time the receiver coils measure the decay of eddy currents, in millivolts (mV), produced in subsurface metallic objects by the pulsed primary EM field. The top coil is gained in such a manner that the instrument response to a metallic object lying on the surface will be approximately equal at both the top and bottom coils. The affects of surface debris can, therefore, be suppressed by calculating the differential response (subtraction of the top coil from bottom coil response). Positive EM-61 anomalies centered over the source are typically observed over buried metallic objects. Above ground metallic objects will often give rise to a negative differential response, as the top coil response is larger than the bottom coil response.

The EM-61 can locate both ferrous and nonferrous metallic objects, and can locate a 1000-gallon tank to a maximum depth of about 8-10 feet. Typical applications of the EM-61 include:

- Locating pits and trenches containing metallic debris
- Locating buried drums, tanks and pipes
- Delineating landfill boundaries
- Detecting unexploded ordnance

Some advantages of EM-61 surveys are:

- Rapid – the EM-61 can acquire data at a slow walking pace
- Responds only to buried metal and measurements not strongly influenced by geology
- Better lateral resolution than magnetometers or frequency domain EM-systems
- Anomalies of buried objects have simple shape facilitating identification and positioning of the source

- Able to acquire meaningful data closer to metallic surface structures than most other methods

Some limitations of EM-61 surveys are:

- Depth of exploration not as great as that of a magnetometer
- Metallic structures such as buildings, fences, reinforced concrete, and light posts interfere with the measurements
- High voltage powerlines can strongly interfere with the measurements
- Cannot typically located utility cables (i.e. electric, telephone and communication cables)

3 FIELD PROCEDURES

This section describes the field procedures used during the investigation, including site preparation, EM-31 and EM-61 survey procedures.

3.1 Site Preparation

Before conducting the geophysical investigation a 300- by 300-foot base grid was established using a Nikon DTM-720 total station and staked. The southeast corner of this grid (geophysical survey coordinate 2100E, 0N) was established 5-feet north and 3-feet west of the fences along the southern and eastern property boundary. The grid was surveyed parallel and perpendicular to south-north (S-N) trending section of Hollywood Way. We recommend that ENSR survey the corners of this base grid to tie the geophysical survey to the State Plane Coordinate System. Using a 300-foot tape measure and the base grid as reference a 20- by 20-foot grid was marked on the ground with surveyor paint. The maximum error in the geophysical survey grid is estimated to be less than 5 feet.

Large surface cultural features that could potentially affect the geophysical data (i.e. metallic fences, light posts, buildings, concrete pads, and other surface metallic objects) were identified in the field and approximately plotted onto a scaled, hand-drawn site map. Most of the infrastructure associated with subsurface utilities such as vaults, manholes, valve boxes, light posts, fire hydrants, and fire/sprinkler control valves were also approximately mapped. Obvious utility trenches visible in asphalted areas were also mapped because of the possibility of using these trench locations to map nonmetallic pipes. Differentiation was also made between paved and soil covered areas because there is no way of identifying nonmetallic pipes in soil areas. A site map showing the boundary of the geophysical survey area, geophysical survey coordinate system, and surficial features is presented as Figure 1.

3.2 Geonics EM-31 Survey

The EM-31 survey was conducted between June 23 and August 5, 1998. At the beginning of each field day, the EM-31 was assembled and battery levels checked. The in-phase component was then set to zero (nulled) in a portion of the site with no buried metallic objects and the instrument phase checked. The EM-31 digital data logger was programmed with the appropriate file name, line number, start station, station increment, and direction. Changes in these parameters were made as necessary throughout the survey. EM-31 measurements of conductivity and in-phase component were made at 5-foot intervals along S-N survey lines spaced 10 feet apart using the 20-foot grid points for spatial control. The EM-31 data were stored in the digital data logger along with line and station number. If an error was made acquiring a line, a note was made in the field log and the line repeated.

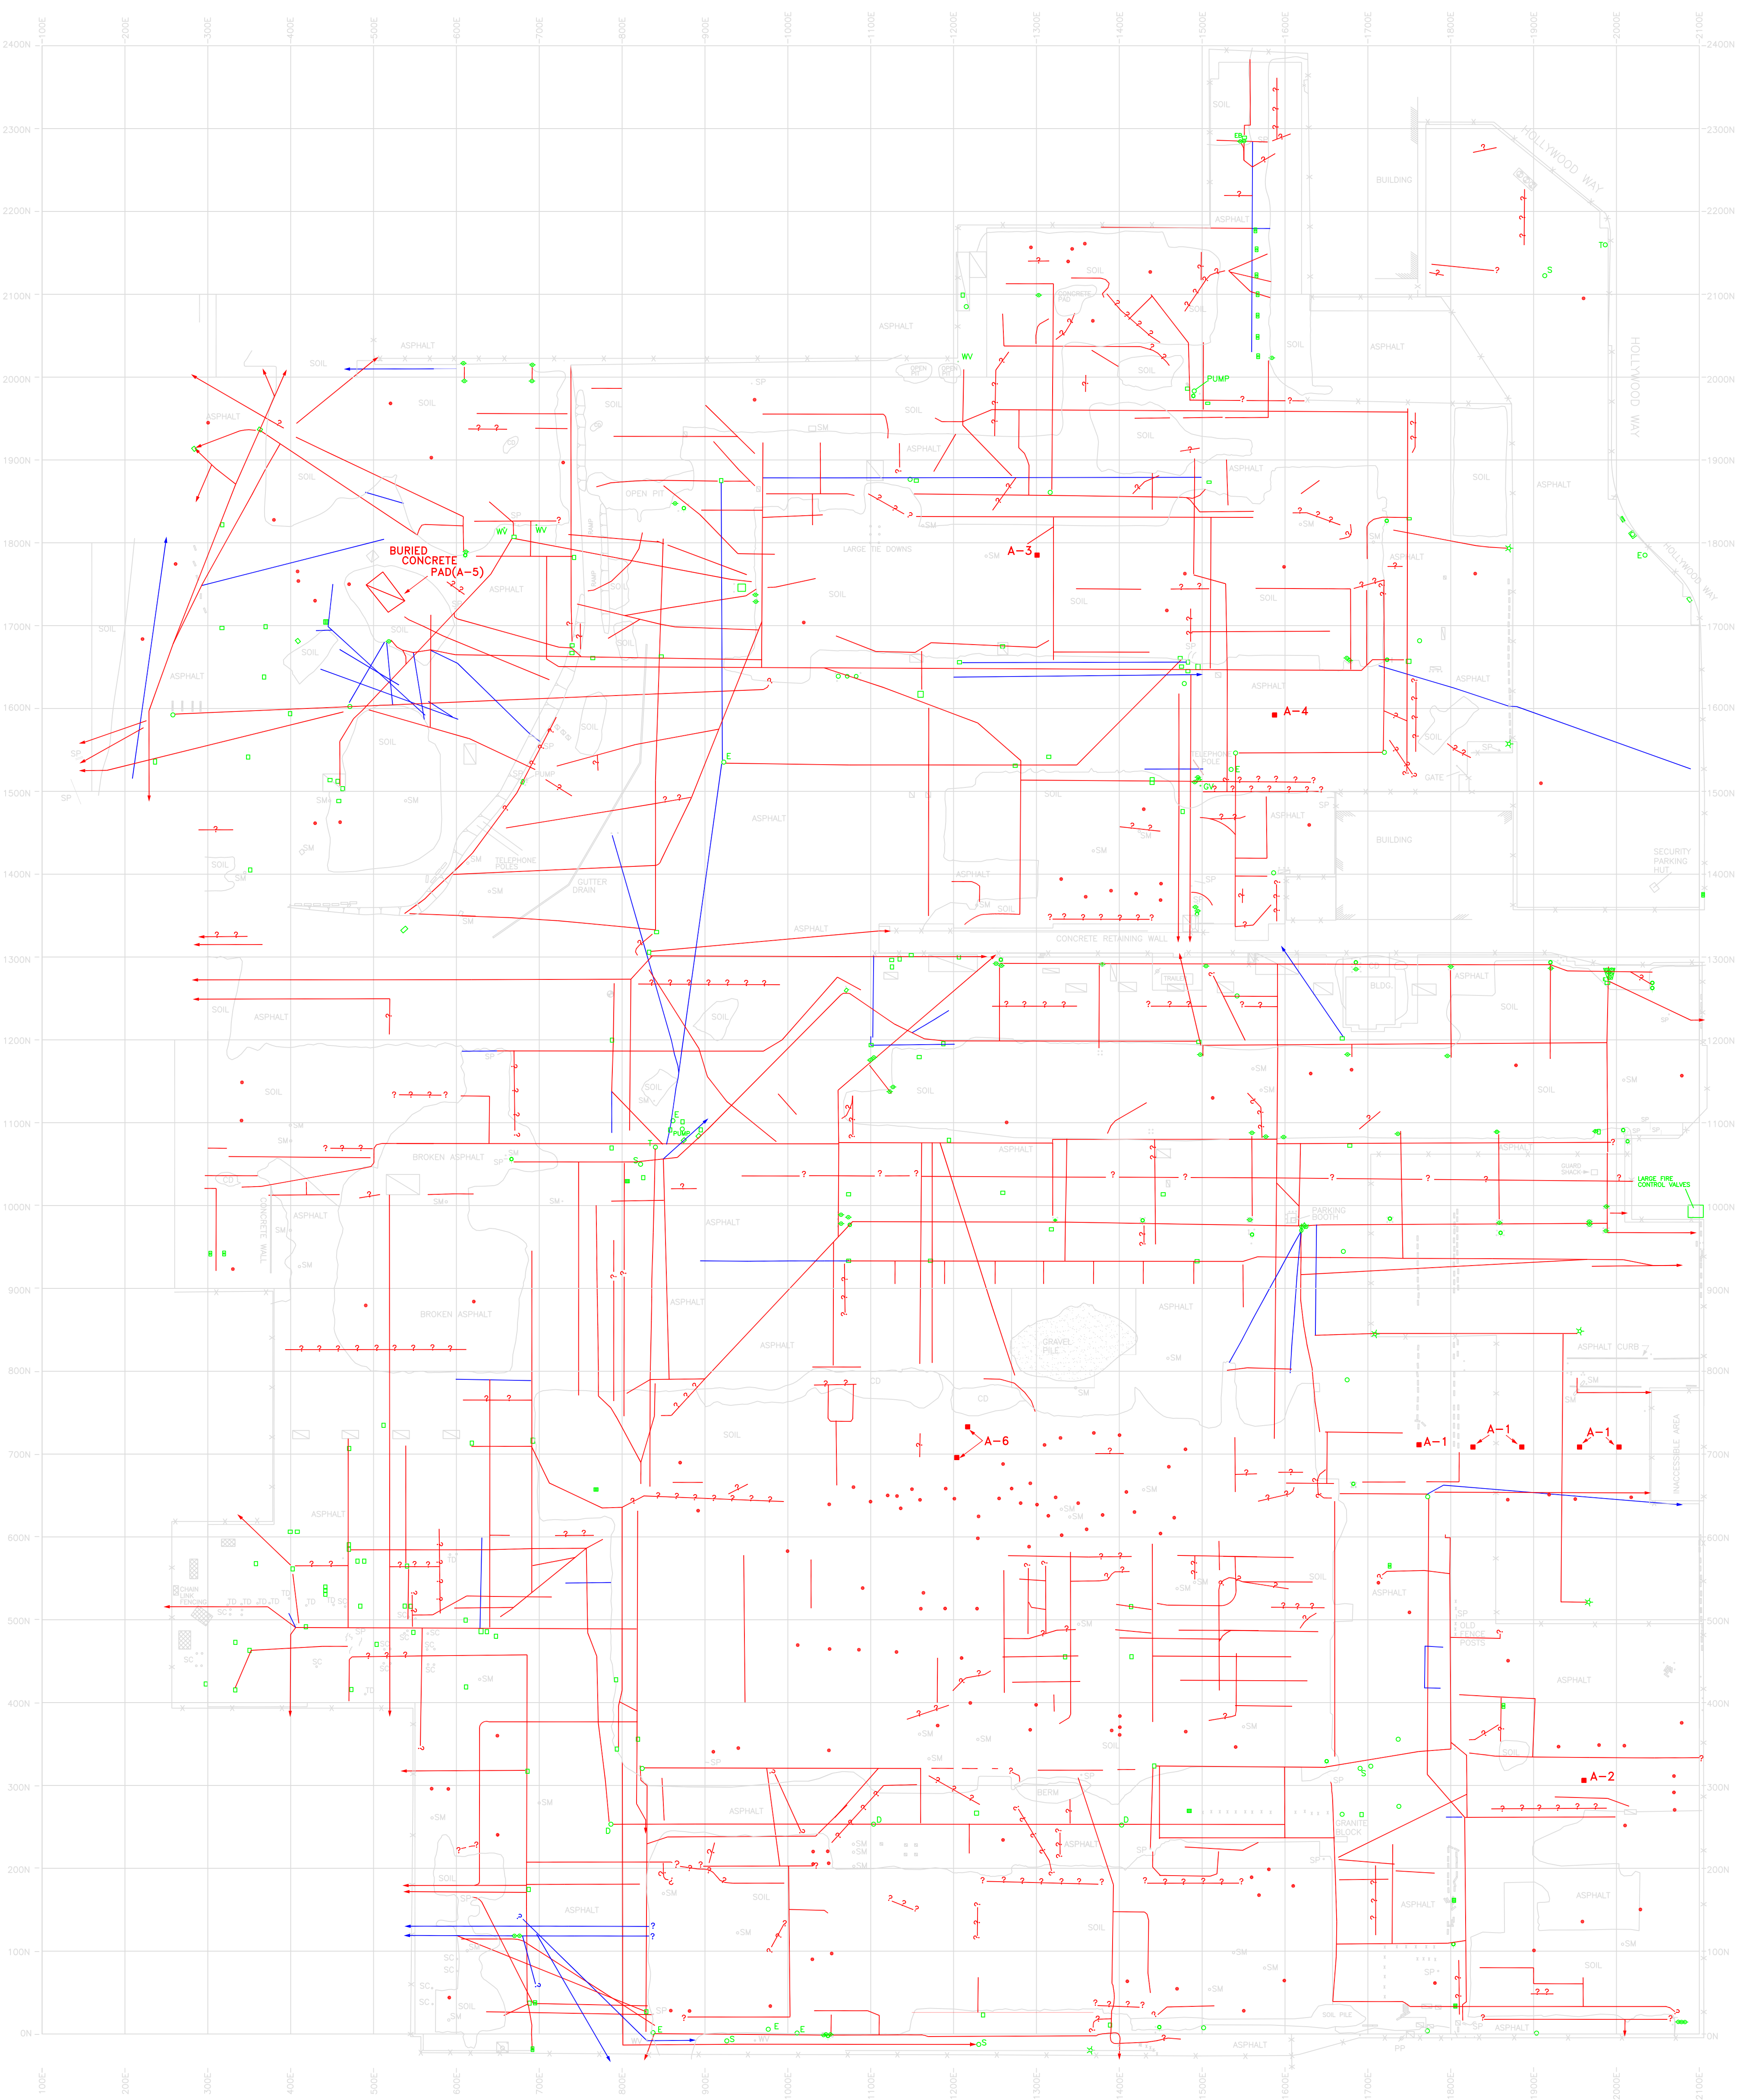

EM-31 data were downloaded to a laptop computer at the end of each field day. Field data files contain line and station number, and conductivity and in-phase component response. Field

operator comments, assigned file names, and possible data logger programming errors were recorded in field notes.

3.3 Geonics EM-61 Survey

The EM-61 survey was conducted between June 19 and July 23, 1998. At the beginning of each field day the EM-61 was assembled and battery levels checked. The EM-61 digital data logger was then programmed with the appropriate file name, line number, start station, station increment, and direction. Changes in these parameters were made as necessary throughout the survey. EM-61 measurements were made at 2.5-foot intervals along S-N survey lines spaced 10 feet apart using the 20-foot grid points for spatial control. The EM-61 data were stored in a digital data logger along with line and station number. If an error was made acquiring a line, a note was made in the field log and the line repeated.

EM-61 data were downloaded to a laptop computer at the end of each field day. Field data files contain line number, station number, and top and bottom coil response. Field operator comments, assigned file names, and possible data logger programming errors were recorded in field notes.

4 DATA PROCESSING AND INTERPRETATION

This section presents the data processing procedures and interpretation of the geophysical data.

4.1 Data Processing

Color-enhanced contour maps of EM-31 and EM-61 data were generated using the GEOSOFT® geophysical mapping system. Prior to contour map generation, a number of preprocessing steps were completed and included:

- Backup of all original field data files to floppy disk
- Correcting of all data acquisition errors (typically only deleting the first portion of a reacquired line, renaming lines incorrectly labeled, deleting additional readings outside the grid, etc.)
- Reformatting field data files to free format XYZ files containing line number, station number, and field measurements
- Applying small adjustments to EM-31 and EM-61 station locations to compensate for data being recorded while the operator was walking
- Merging of multiple data files into a single file and sorting, if necessary
- Sorting of merged data files

The output of the data preprocessing was a data file containing line and station number and conductivity and in-phase component (EM-31 survey) or top coil, bottom coil, and differential response (EM-61 survey). These data files were imported into the GEOSOFT® mapping system and the following data processing steps applied:

- Reformatting of data files to GEOSOFT® format
- Generating final map scale
- Gridding data using a 2.5-foot cell size and down- and cross-line Akima splines
- Masking grid in areas where data not acquired, if necessary
- Applying a single pass Hanning filter to smooth the data
- Generating color zone file describing color for different data ranges
- Contouring the data
- Generating map surrounds (title block, legend, scale, color bar, north arrow, etc.)
- Annotating anomalies
- Merging various plot files and plotting final map

The names of the files generated and the processing parameters used were recorded on data processing forms. All completed data processing forms are retained in project files. All files generated during the processing sequence were archived on 8-mm digital tape.

4.2 Interpretation

Color-enhanced contour maps of EM-31 conductivity response and EM-61 differential response are presented as Figures 2 and 3, respectively. The coordinates shown in these figures reference the relative geophysical coordinate system shown in Figure 1. The color bar indicates the amplitude of the measured quantity with magenta and cyan indicating high- and low-amplitudes, respectively. Light orange, yellow and light green indicate average "background" values of the measured quantity. Contour maps were also generated for EM-31 in-phase component and EM-61 bottom coil response. These data are not presented, as they did not generally provide additional information but are, however, retained in project files. Most of the EM-61 interpretation was made using differential response data as it was not as affected by surface debris as the bottom coil response data. Both conductivity and in-phase component response were used for interpretation of the EM-31 data. At this site, the EM-31 conductivity response generally responded much stronger to buried pipes than the in-phase response.

No attempt was made to label all anomalies on the contour maps due to the map scale and large number of anomalies. The potential sources of all anomalies were, however, interpreted. Numerous anomalies caused by surface features such as buildings, concrete pads, vaults, manholes, surface debris, etc. are evident on the contour maps of EM-31 and EM-61 data (Figures 2 and 3). Many of these types of anomalies are labeled as "SM" on the contour maps. All negative EM-61 differential response anomalies are caused by above ground metallic objects. Anomalies caused by the numerous fences on and around the perimeter of the site are labeled as "F". Typical linear EM-31 and EM-61 anomalies interpreted as being caused by buried pipes or utility cables are labeled as "P". The locations of underground metallic pipes are generally better resolved in EM-61 data, primarily because the EM-61 has a coincident 3-foot square transmitter and receiver coil while the EM-31 has separate transmitter and receiver coils separated by 12 feet. The EM-61 also detected many more pipes than the EM-31. There were however many pipes, primarily utility cables, detected by the EM-31 but not by the EM-61. Any pipe with a strong EM-31 response but no or weak EM-61 response is most likely a utility cable. Neither method was able to locate nonmetallic pipes, but there was at least one case where the EM-61 detected a probable reinforced concrete drain line.

The geophysical survey line spacing of 10-feet is sufficient to locate tanks or other large metallic objects with dimensions greater than or equal to those of a 1,000 gallon tank. Metallic objects of this size are expected to yield high-amplitude EM-31 and EM-61 anomalies with dimensions of at least 15- by 15-feet.

There are numerous very small anomalies on the EM-31 and EM-61 contour maps (Figure 2 and 3) exhibiting a positive EM-61 differential response and occasionally a weak EM-31 response. The size of these anomalies indicates that the sources are very small metallic objects or debris. Most of these anomalies were not field checked as they are too small to be caused by a UST. These anomalies are labeled as "B" on the contour maps of EM-31 and EM-61 data and are interpreted as small pieces of metallic debris such as rebar, pipe segments, steel posts cut to grade, etc. located beneath the surface or on the surface between survey lines.

Only six large anomalies that do not appear to be related to underground pipes or surface features are present on the contour maps of EM-31 and EM-61 data. Each of these anomalies was field

checked to confirm it did not have a surface source. The anomalies are labeled as A-1 to A-6 on Figures 2 and 3 and are discussed below. Anomaly A-1 identifies 5 small positive EM-31 anomalies orientated in an east-west direction on about 60-foot centers between survey coordinates 1760E, 710N and 2000E, 710N. There is an EM-61 bottom coil response associated with these anomalies but no or very weak differential response indicating that the source is located immediately beneath the asphalt. These anomalies are not caused by USTs, but rather are probably associated with a small former surface feature now covered by asphalt.

Anomalies A-2, A-3 and A-4 identify small negative EM-31 and positive EM-61 anomalies located near geophysical survey coordinates 1960E, 305N; 1300E, 1785N and 1590E, 1595N, respectively. These anomalies appear to be too small to be caused by a 1,000 gallon, or larger, UST. Most likely the anomalies are caused by small buried metallic objects such as pipe segments, rebar, reinforced concrete, or other construction debris.

Anomaly A-5 identifies a large EM-31 and EM-61 anomaly centered at geophysical survey coordinates 515E, 1740N. This anomaly was excavated by ENSR and found to be caused by a buried concrete pad.

Anomaly A-6 identifies two, adjacent EM-61 anomalies located near survey coordinates 1205E, 695N and 1220E, 730N. The absence of associated EM-31 anomalies indicates that these anomalies are probably not caused by USTs. The anomalies are located in a soil-covered area where a building was demolished and are most likely caused by small accumulations of construction rubble. Numerous other very small anomalies most likely caused by small pieces of debris also exist in the area.

There appear to be no geophysical anomalies in portions of the survey area not significantly impacted by subsurface pipes or surface structures that are potentially associated with 1,000 gallon, or larger, USTs.

5 RESULTS

Geonics EM-31 and EM-61 surveys were conducted at the Burbank Airport/Lockheed B-6 facility to locate buried metallic pipes and utility cables, underground storage tanks, and other large buried metallic objects.

Interpretation of the geophysical data collected at this site is summarized in Figure 1. The interpreted locations of metallic pipes and utility cables are shown as red lines. Most of pipes trending perpendicular or at a high angle to the survey lines were interpreted directly from the data and have an estimated accuracy of about 2.5 feet. These pipes are shown as solid red lines on Figure 1. The locations of south-north trending pipes (parallel to survey lines) could not be interpreted to as high a precision due to the 10-foot survey line spacing. Many of these pipes were traced with a Metrotech 9890 EM utility locator and others had visible trench outlines in the asphalt. These pipes are also shown as a solid red line and have map accuracy of about 2.5 feet. Some south-north trending pipes were not traced or could not be traced with the utility locator due to short length. These pipes are shown as dashed red lines and probably have a maximum error of 5 feet. Other metallic pipes that are only approximately located are also shown as dashed red lines. Interpreted pipes that are uncertain, either in regards to location or presence, are dashed and queried on Figure 1. It should be noted that multiple pipes in a single trench might be associated with some of the interpreted pipes on Figure 1.

Numerous possible utility trench outlines in asphalted portions of the site were mapped. Where not associated with EM-31 or EM-61 anomalies these trenches were interpreted as the locations of potential nonmetallic pipes such as water and sewer lines. These are shown as blue lines on Figure 1 and are obviously only present in asphalted portions of the site. Much of the surface infrastructure associated with subsurface utilities (i.e. manholes, vaults, fire hydrants, fire control valves, drains, light posts) was also mapped. It should be assumed that nonmetallic pipes are present where these features were mapped but no pipes interpreted.

Numerous small EM-61 and occasional EM-31 anomalies interpreted as being caused by small pieces of metallic debris were interpreted and are shown as red dots on Figure 1. None of these anomalies appear large enough to be of any concern. Additionally, six larger anomalous zones requiring further discussion were identified and labeled as A-1 to A-6. These anomalies were discussed in the previous section and none appear to have the size or characteristics of a 1,000 gallon or larger UST.

This geophysical survey was designed to locate all buried metallic objects with dimensions greater than those of a 1000-gallon tank. It is our opinion that the geophysical survey located all such metallic objects at depths less than about 8 feet; except possibly in portions of the survey area where data were adversely affected by surface or subsurface features, such as metallic debris, fences, reinforced concrete pads, utility corridors, and buildings.

6 CERTIFICATION

All geophysical data, analysis, interpretations, conclusions, and recommendations in this document have been prepared under the supervision of and reviewed by a **GEOVision** California Registered Geophysicist.

Antony J. Martin

Date

California Registered Geophysicist GP989

GEOVision Geophysical Services

- * This geophysical investigation was conducted under the supervision of a California Registered Geophysicist using industry standard methods and equipment. A high degree of professionalism was maintained during all aspects of the project from the field investigation and data acquisition, through data processing interpretation and reporting. All original field data files, field notes and observations, and other pertinent information are maintained in the project files and are available for the client to review for a period of at least one year.

A registered geophysicist's certification of interpreted geophysical conditions comprises a declaration of his/her professional judgment. It does not constitute a warranty or guarantee, expressed or implied, nor does it relieve any other party of its responsibility to abide by contract documents, applicable codes, standards, regulations or ordinances.

No Further Requirements, Area #3, Subsurface Soil Investigation, Building 353 - Dry Wells and Reservoir Sump, Lockheed Plant B-6 (File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed the "Area #3 Subsurface Soil Investigation, Building 353 - Dry Wells and Reservoir Sump" report dated September 27, 1996, prepared by your consultant, Tetra Tech Inc. This report documents results of soil assessment intended to determine the extent of petroleum hydrocarbon impact beneath the subject area. Upon review, we have the following comments with respect to the Well Investigation Program:

1. During the subject phase of assessment, a total of 48 soil samples were collected from 3 boreholes drilled to a maximum depth of 90' bgs in the subject area.
2. Maximum concentrations of TRPH (total recoverable petroleum hydrocarbons) and TEH (total extractable hydrocarbons) were detected at 10' bgs at concentrations of 210 mg/kg and 270 mg/kg, respectively. TRPH and TEH concentrations were either non-detectable or less than 21 mg/kg at depths greater than 10' bgs. Previous assessment detected maximum concentrations of 709 mg/kg TRPH at 10' bgs adjacent at the reservoir sump and up to 255 mg/kg TRPH at 60' bgs in the vicinity of the dry wells.
3. The subject report and previous assessment demonstrate that petroleum-hydrocarbon impacted soil is limited to areas adjacent to the former dry wells and reservoir sump. Ground water is at approximately 260' bgs in this area.

Based on the subject submittal and other information in our files, we have no further requirements with respect to the Well Investigation Program. Soil contamination detected in this area is not a threat to ground water quality and therefore cleanup is not necessary.

2550 North Hollywood Way, Suite 305
Burbank, California 91505-0256No Further Requirements, Area #4, Subsurface Soil Investigation,
Building 353 - Process Lines, Lockheed Plant B-6
(File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed the "Plant B-6: Area #4 Subsurface Soil Investigation, Building 353 - Process Lines" report dated September 12, 1996, prepared by your consultant, Tetra Tech Inc. This report documents results of soil assessment to determine metals impact in the process line area located within Building 353 at the Plant B-6 site. Upon review, we have the following comments with respect to the Well Investigation Program:

1. During the subject phase of assessment, a total of 72 soil matrix samples were collected from 8 boreholes drilled to a maximum depth of 50' bgs in the subject area.
2. The concentrations of metals detected in soil matrix samples were below TLC and less than 10 times the STLC concentrations. The highest concentration of lead was 16 mg/kg collected at 10' bgs. Lead was previously detected at 358 mg/kg, which is above 10 times the STLC (50 mg/kg), in a sample collected at 2' bgs in the subject area.
3. Ground water is at approximately 260' bgs in this area.

Based on the subject submittal and other information in our files, we have no further requirements with respect to the Well Investigation Program. Soil contamination detected in this area is not a threat to ground water quality and therefore cleanup is not necessary.

The jurisdictional requirements of other agencies, such as the U.S. Environmental Protection Agency, are not affected by this Board's "no further requirements" decision. Such agencies may choose to make their own determinations regarding the site.

No Further Requirements, Area #5 - Building 353 - Former TCA Degreaser, Lockheed Plant B-6 (File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed Lockheed Martin's "Area #5 Subsurface Soil Investigation, Building 353 - Former TCA Degreaser" report dated October 25, 1996, prepared by your consultant, Tetra Tech Inc. This report documents the results of supplementary soil and soil gas investigations in the former TCA degreaser area located in former Building 353 within Lockheed Plant B-6. Upon review, we have the following comments with respect to the Well Investigation Program:

1. Prior to drilling and sampling, the 1,1,1-TCA degreaser containment pit and a previously undiscovered concrete pit below it were removed and the area excavated to a depth of 15' bgs.
2. Laboratory analysis of 46 soil matrix samples collected in the subject area to a maximum depth of 200' bgs detected only low concentrations (<48 ug/kg) of VOCs, primarily 1,1,1-TCA, and a maximum of 140 mg/kg TRPH (at 90' bgs). A tentatively identified compound (1,4-dioxane) was detected in samples taken from 20' to 50' bgs at concentrations between 0.04 and 3.3 mg/kg.
3. Laboratory analysis of 36 soil vapor samples from the subject site detected 1,1,1-TCA at concentrations ranging from 69 to 448 ug/L at depths of 30' to 60' bgs, and lesser concentrations of other contaminants. 1,1,1-TCA concentrations in soil vapor samples collected at depths from 60' to 200' bgs did not exceed 86 ug/L. Other VOCs were also detected in some samples at concentrations below 291 ug/L.
4. Previous investigations in this area detected TRPH to a depth of 10' bgs at a maximum concentration of 92 mg/kg (at 2' bgs). Ten tentatively identified VOCs were detected in soil matrix samples from 15' to 55' bgs at concentrations from 7 to 400 ug/kg.

104-01-47981

LEGIBILITY TEST: For quality of original documents being filmed.

LWL2 002280

Ron N. Helgerson
Lockheed Martin Corporation
Page 2

5. Multi-depth soil gas samples collected to a maximum depth of 61' bgs during previous investigations in this area contained 1,1,1-TCA at maximum concentration of 739 ug/L (at 6' bgs). Low concentrations (<107 ug/L) of 1,1-DCE, TCE, PCE and freon-113 were also detected.
6. Ground water is approximately 260' bgs in this area.

Based on the subject submittal and other information in our files, we have no further requirements with respect to the Well Investigation Program. Residual soil contamination detected in this area is not a threat to ground water quality and therefore additional cleanup is not warranted.

The jurisdictional requirements of other agencies, such as the U.S. Environmental Protection Agency, are not affected by this Board's "no further requirements" decision. Such agencies may choose to make their own determinations regarding the site.

If you have any questions, please contact Alex Carlos at (213) 266-7583.

Building 304 - Former UST F25, Lockheed Plant B-6
(File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed the "Plant B-6: Area #13 Subsurface Soil Investigation, Building 304 - Former UST F25" report dated October 25, 1996, prepared by your consultant, Tetra Tech Inc. This report presents results of assessment of petroleum hydrocarbon impact beneath the former 1,750 gallon diesel underground storage tank (UST) F25 (removed in 1989) located southwest of Building 304 within Lockheed Plant B-6. Upon review, we have the following comments with respect to the Well Investigation Program:

1. During the subject phase of assessment, a total of 110 soil samples were collected from 5 boreholes drilled to a maximum depth of 200' bgs in the subject UST area.
2. TRPH (total recoverable petroleum hydrocarbons) and TEH (total extractable hydrocarbons) characterized as diesel and motor oil were detected at maximum concentrations of 81 mg/kg (at 90' bgs) and 34 mg/kg (at 130' bgs), respectively. TRPH and TEH concentrations were either non-detectable or less than 50 mg/kg in all the other samples analyzed. Previous assessment detected maxima of 5,400 mg/kg TRPH (at 45' bgs) and 5,000 mg/kg (at 45' bgs) petroleum hydrocarbons in the diesel range in the subject UST area. No other contaminants were detected above trace levels in samples from the subject area.
3. Ground water is at approximately 210' bgs in this area.

Based on the subject submittal and other information in our files, we have no further requirements with respect to the Well Investigation Program. Soil contamination detected in this area is not a threat to ground water quality and therefore cleanup is not warranted.

Ron N. Helgerson
Lockheed Martin Corporation
2550 North Hollywood Way, Suite 305
Burbank, California 91505-0256No Further Requirements, Former UST F14, Building 309, Lockheed Plant B-6 (File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed the "Plant B-6: Supplemental Subsurface Soil Investigation, Building 309 - Former UST F14" report dated November 6, 1996, prepared by your consultant, Tetra Tech Inc. This report presents results of supplemental assessment of petroleum hydrocarbon impact beneath the former 3,000 gallon diesel underground storage tank F14 located near the northeast corner of Building 309 in Plant B-6. Upon review, we have the following comments with respect to the Well Investigation Program:

1. During the subject phase of assessment, a total of 19 soil samples were collected from 2 boreholes drilled to a maximum depth of 60' bgs in the subject UST area.
2. Total recoverable petroleum hydrocarbons (TRPH) and total extractable hydrocarbons (TEH) characterized as diesel were detected at maximum concentrations of 3,520 mg/kg (10' bgs) and 4,360 mg/kg (10' bgs), respectively. TRPH and TEH concentrations were either non-detectable or less than 32 mg/kg in all the remaining samples analyzed. Previous assessments detected a maximum of 7,200 mg/kg TEH compounds in the diesel range (2' below the base of the tank) in the subject UST area. No aromatic volatile organic compounds were detected in samples collected in the subject area.
3. Ground water is at approximately 200' bgs in this area.

Based on the subject submittal and other information in our files, we have no further requirements with respect to the Well Investigation Program. Petroleum hydrocarbons detected in soil in this area is not a threat to ground water quality and therefore cleanup is not warranted.

The jurisdictional requirements of other agencies, such as the U.S. Environmental Protection Agency, are not affected by this Board's "no further requirements" decision. Such agencies may choose to make their own determinations regarding the site.

We have reviewed the "Plant B-6: Area #11 Subsurface Soil Investigation, Building 310 - Former Closed In-Place UST F15" report dated October 11, 1996, prepared by your consultant, Tetra Tech Inc. This report presents results of assessment of petroleum hydrocarbon impact beneath the former 3,000 gallon diesel underground storage tank (F15) located outside the southwest corner of Building 310 within Plant B-6. Upon review, we have the following comments with respect to the Well Investigation Program:

1. During the subject phase of assessment, a total of 55 soil samples were collected from 4 boreholes drilled to a maximum depth of 147' bgs in the subject UST area.
2. TRPH (total recoverable petroleum hydrocarbons) and TEH (total extractable hydrocarbons) were detected at maximum concentrations of 160 mg/kg (42.5' bgs) and 220 mg/kg (147.5' bgs), respectively. TRPH and TEH concentrations were either non-detectable or less than 69 mg/kg in all the remaining samples analyzed. Previous assessments detected a maximum of 570 mg/kg (2' below the base of the tank) TEH compounds in the diesel range and lower TRPH concentrations in the subject UST area. No VOC, SVOC, PCB or metal compounds were detected in samples collected in the subject area.
3. Ground water is at approximately 260' bgs in this area.

Based on the subject submittal and other information in our files, we have no further requirements with respect to the Well Investigation Program. Soil contamination detected in this area is not a threat to ground water quality and therefore cleanup is not warranted.

The jurisdictional requirements of other agencies, such as the U.S. Environmental Protection Agency, are not affected by this Board's "no further requirements" decision. Such agencies may choose to make their own determinations regarding the site.

No Further Requirements, Area #10, Subsurface Soil Investigation, Building 310 - Former Closed In-Place UST F20, Lockheed Plant B-6 (File No. 104.0674) (Cleanup & Abatement Order No. 87-151)

We have reviewed the "Plant B-6: Area #10 Subsurface Soil Investigation, Building 310 - Former Closed In-Place UST F20" report dated October 11, 1996, prepared by your consultant, Tetra Tech Inc. This report presents results of assessment of petroleum hydrocarbon impact beneath the former 3,000 gallon diesel underground storage tank (F20) located outside the northeast corner of Building 310 within Plant B-6. Upon review, we have the following comments with respect to the Well Investigation Program:

1. During the subject phase of assessment, a total of 58 soil samples were collected from 4 boreholes drilled to a maximum depth of 150' bgs in the subject UST area. UST F20 was closed in-place in 1989 and removed in July 1996.
2. TRPH (total recoverable petroleum hydrocarbons) and TEH (total extractable hydrocarbons) were detected at maximum concentrations of 320 mg/kg (5' bgs) and 21 mg/kg (40' bgs), respectively. Lower concentrations were in samples collected during previous phases of assessment. No VOC, SVOC or PCB compounds were detected in the samples.
3. Ground water is at approximately 260' bgs in this area.

Based on the subject submittal and other information in our files, we have no further requirements with respect to the Well Investigation Program. Soil contamination detected in this area is not a threat to ground water quality and therefore cleanup is not warranted.

The jurisdictional requirements of other agencies, such as the U.S. Environmental Protection Agency, are not affected by this Board's "no further requirements" decision. Such agencies may choose to make their own determinations regarding the site.

DATE RECD. 12/4/96

WBS # 3A

COPIES TO: Louise, Gilbert,

Richard Helgeson, Ugo,

December 3, 1996

Ron N. Helgeson
Lockheed Martin Corporation
Burbank Program Office
2550 North Hollywood Way, Suite 305
Burbank, CA 91505-1055No Further Requirements, Parcel A, Lockheed Plant B-6 West
(File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed your November 8, 1996, letter requesting closure for Parcel A at Plant B-6 as notated on the map that accompanied the letter. Upon review of the subject proposal and other information in our files, we have the following comments with respect to the Well Investigation Program:

1. During multiple phases of assessment, approximately 663 soil matrix and 140 soil gas samples were collected at the subject parcel. Based on the results of these investigations, nine areas that required further assessment were identified:

Building 309/310
 Building 322 southeast corner (Site 19)
 Southeast Parking Lot #7 (Site 20)
 Building 310 former UST F17 (Site 21)
 Building 309 former UST F9/F17 (Site 22)
 Building 310 former closed in-place UST F20 (Area #10)
 Building 310 former closed in-place UST F15 (Area #11)
 Building 304 sump/sand trap (Area #12)
 Building 304 former UST F14

2. Additional soil gas investigation within Building 309/310 demonstrated that the relatively low VOC concentrations (<31 ug/L) were limited primarily to depths less than 20' bgs. Based on these results, Board staff required no further investigation in this area on August 8, 1995.
3. At Sites 19, 20, 21 and 22, further soil assessment was conducted to determine the extent of petroleum hydrocarbon and metal impact. Investigation results demonstrated that soil contamination is limited to relatively small areas and shallow depths (<25' bgs). Based on confirmation sampling results obtained during the limited excavation delineation in the subject sites, the Board approved backfilling in July 1996.

JDR 10 7 6 1

LEGIBILITY TEST: For quality of original documents being filmed.

LWL2 002273

4. Additional subsurface investigation was conducted in Area #10 to delineate the extent of petroleum hydrocarbon impact beneath the former 3,000 gallon diesel UST F20. Petroleum hydrocarbon concentrations detected were less than 320 mg/kg and limited to shallow depths (less than 40' bgs). On October 28, 1996, Board staff issued a "no further requirements" letter for this area.
5. Based on supplementary assessment at Area #11 (former diesel UST F15), we issued a "no further requirements" letter on October 24, 1996. Petroleum hydrocarbons were detected at maximum concentration of 570 mg/kg 2' below the base of the tank in the subject UST area.
6. Supplementary assessment was conducted in Area #12 to determine the extent of VOC impact. No VOCs and less than 310 mg/kg of petroleum hydrocarbons were detected during the investigation. On May 9, 1996, Board staff made a "no further assessment" determination for this area.
7. On November 19, 1996, Board staff issued a "no further requirements" letter for UST F14 based on the limited area and depth (approximately 90' bgs) of soil contamination, relatively low concentrations of petroleum hydrocarbons and depth to groundwater (approximately 210' bgs). Supplemental assessment in this area detected TRPH and TEH (characterized as diesel) at maximum concentrations of 3,520 mg/kg (10' bgs) and 4,360 mg/kg (10' bgs), respectively. No aromatic VOCs were detected in the subject area.

Based on our inspections and information submitted, we have no further requirements with respect to the Well Investigation Program for the subject parcel. Remaining soil contamination in this parcel is not a threat to ground water quality and therefore further cleanup is not warranted. This parcel is therefore excluded from requirements in our Cleanup and Abatement Order No. 87-161.

Ron N. Helgerson
Lockheed Martin Corporation
Burbank Program Office
2550 North Hollywood Way, Suite 305
Burbank, CA 91505-1055No Further Requirements, Parcel B, Lockheed Plant B-6 West
(File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed the July 26, 1996, letter requesting closure for Parcel B of Plant B-6 as notated on the map that accompanied the letter. Upon review of the subject proposal and other information in our files, we have the following comments with respect to the Well Investigation Program:

1. During multiple phases of assessment, a total of 193 soil matrix samples were collected from 20 boreholes in this parcel. Laboratory analysis of these samples detected maximum concentrations of 6,820 mg/kg TRPH at 2' bgs, 23 ug/kg acetone, 6 ug/kg TCE, 22 ug/kg 4-methyl-2-pentanone, 3.2 mg/kg bis(2-ethylhexyl)phthalate at 10' bgs, 580 ug/kg pyrene, 480 chrysene and 400 ug/kg benzoanthracene, 98 ug/kg aroclor-1254 (PCBs) at 2' bgs. Supplemental sampling demonstrated that the soil contamination is limited to small areas and shallow depths. Ground water is at approximately 200' bgs in this area.
3. A total of 126 soil gas samples were collected on the subject parcel to a maximum depth of 60' bgs. Only minor concentrations of PCE (maximum 3 ug/L), TCE (maximum 69 ug/L), carbon tetrachloride (maximum 14 ug/L), DCE (maximum 7 ug/L) and freon-113 (maximum 9 ug/L) were detected in these samples.

Based on our inspections and information submitted, we have no further requirements with respect to the Well Investigation Program for the subject parcel. The soil contamination detected in this parcel is not a threat to ground water quality and therefore cleanup is not necessary. This "no further requirements" determination for this parcel does not affect requirements for assessment and cleanup on the other adjacent parcels covered by our Cleanup and Abatement Order No. 87-161. We have no information concerning other conditions that would adversely impact the value or usage of this property. However, additional assessment or remediation may be needed depending on future use of this site.

Burbank, CA 91505-1055

No Further Requirements, Parcels B, C, I and L, Lockheed Plant B-6
West (File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

Recently, we issued no further requirements with respect to the
Well Investigation Program for the subject parcels. The soil
contamination detected in these parcels is not a threat to ground
water quality and therefore cleanup is not necessary. As a result,
the subject parcels are excluded from requirements set forth in
Cleanup and Abatement Order No. 87-161. This "no further
requirements" determination for these parcels does not affect
requirements for assessment and cleanup on the other adjacent
parcels covered by our Cleanup and Abatement Order No. 87-161.

If you have any questions, please contact Alex Carlos at (213) 266-
7583.

No Further Requirements, Parcel C, Lockheed Plant B-6 West
(File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed your July 26, 1996, letter requesting closure for Parcel C of Plant B-6 as notated on the map that accompanied the letter. Upon review of the subject proposal and other information in our files, we have the following comments with respect to the Well Investigation Program:

1. During multiple phases of assessment at the subject site, a total of 65 soil matrix samples were collected on this parcel. Laboratory analysis of these samples detected maximum concentrations of 6600 mg/kg TRPH at 15' bgs and 4100 mg/kg TPH-diesel at 2' bgs [near a former diesel/fuel oil UST (F32)], 120 ug/kg acetone, 12 ug/kg MEK, 340 ug/kg bis(2-ethylhexyl)phthalate, 350 ug/kg di-n-butylphthalate, 420 ug/kg anthracene, 5100 ug/kg pyrene, 1300 ug/kg benzopyrene, 4000 ug/kg benzoanthracene, 3200 ug/kg benzopyrene, 5000 ug/kg benzofluoranthene, 1300 ug/kg indenopyrene, 4600 ug/kg chrysene, 510 ug/kg dibenzanthracene, 4700 ug/kg fluoranthene, 1300 ug/kg phenanthrene and 49 ug/kg aroclar-1254. Supplemental sampling demonstrated that the identified soil contaminated is limited to relatively small areas and shallow depths. Ground water is at approximately 200' bgs in this area.
2. Additionally, a total of 21 shallow (6' bgs) soil gas samples were collected on the subject parcel. Only low concentrations of TCE (maximum 11 ug/L) were detected in these samples.

Based on our inspections and information submitted, we have no further requirements with respect to the Well Investigation Program for the subject parcel. The soil contamination detected on this parcel is not a threat to ground water quality and therefore cleanup is not necessary. This "no further requirements" determination for this parcel does not affect requirements for assessment and cleanup on the other adjacent parcels covered by our Cleanup and Abatement Order No. 87-161. We have no information concerning other conditions that would adversely impact the value

No Further Requirements, Parcel I, Lockheed Plant B-6 West.....
(File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed your July 26, 1996, letter requesting closure for Parcel I of Plant B-6 as notated on the map that accompanied the letter. Upon review of the subject proposal and other information in our files, we have the following comments with respect to the Well Investigation Program:

1. During initial assessment on this parcel, a total of 13 soil matrix samples were collected and analyzed. Laboratory analysis of these samples detected maximum concentrations of 4,881 mg/kg TRPH (2' bgs) and 11 ug/kg acetone. Supplemental sampling demonstrated that the TPH soil contamination is limited to small areas and shallow depths. Ground water is at approximately 210' bgs in this area.
2. Assessment on the subject parcel also included a total of 17 soil gas samples collected to a maximum depth of 60' bgs. Only relatively minor concentrations of 1,1,1-TCA (maximum 37 ug/L), 1,1-DCE (maximum 99 ug/L) and freon-113 (maximum 46 ug/L) were detected in these samples.

Based on our inspections and information submitted, we have no further requirements with respect to the Well Investigation Program for the subject parcel. Remaining soil contamination detected on this parcel is not a threat to ground water quality and therefore cleanup is not necessary. This "no further requirements" determination for this parcel does not affect requirements for assessment and cleanup on other adjacent parcels covered by our Cleanup and Abatement Order No. 87-161. We have no information concerning other conditions that would adversely impact the value or usage of this property. However, additional assessment or remediation may be needed depending on future use of this site.

The jurisdictional requirements of other agencies, such as the U.S. Environmental Protection Agency, are not affected by this Board's "no further requirements" decision. Such agencies may choose to make their own determinations regarding the site.

No Further Requirements, Parking Lot Northeast of Building 82, Lockheed Plant B-6 (File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have received (September 18, 1996) the report "Geophysical Survey, Parking Lot Northeast of Lockheed Building 82" dated 1996, prepared by your consultant, Tetra Tech, Inc. The report presents results of a geophysical survey and exploratory trenching conducted to identify subsurface anomalies which may be associated with VOCs previously detected in the subject area.

Although the geophysical survey detected anomalies, subsequent trenching in two anomalous areas did not detect subterranean structures or debris. Based on the information submitted and other information contained in our files, no further investigation related to the subject area is required with respect to the Well Investigation Program. As noted in our August 8, 1995, letter, soil vapor data from this area demonstrated low VOC concentrations and therefore no further soil gas investigation is needed.

The jurisdictional requirements of other agencies, such as the U.S. Environmental Protection Agency, are not affected by this Board's "no further requirements" decision. Such agencies may choose to make their own determinations regarding the site. If you have any questions, please contact Alex Carlos at (213) 266-7583.

No Further Requirements, Area #7, Subsurface Soil Investigation,
Building 88 - Former Fuel UST, Lockheed Plant B-6
(File No. 104.0574) (Cleanup & Abatement Order No. 87-161)

We have reviewed the "Area #7 Subsurface Soil Investigation, Building 88 - Former Fuel UST" report dated September 27, 1996, prepared by your consultant, Tetra Tech Inc. This report documents results of soil assessment of petroleum hydrocarbon impact at the former 5,000 gallon UST located north of Building 88 within Plant B-6. Upon review, we have the following comments with respect to the Well Investigation Program:

1. During the subject phase of assessment, a total of 61 soil samples were collected from 4 boreholes drilled to a maximum depth of 140' bgs in the subject UST area.
2. Maximum concentrations of TRPH (total recoverable petroleum hydrocarbons) and TEH (total extractable hydrocarbons) were detected in shallow soil matrix samples at concentrations of 980 mg/kg and 480 mg/kg, respectively. TRPH and TEH concentrations were either non-detectable or less than 130 mg/kg at depths greater than 10' bgs. Previous assessment detected lower concentrations in the subject UST area.
3. Ground water is at approximately 260' bgs in this area.

Based on the subject submittal and other information in our files, we have no further requirements with respect to the Well Investigation Program. Soil contamination detected in this area is not a threat to ground water quality and therefore cleanup is not warranted.

The jurisdictional requirements of other agencies, such as the U.S. Environmental Protection Agency, are not affected by this Board's "no further requirements" decision. Such agencies may choose to make their own determinations regarding the site.

No Further Requirements - Area #8, Subsurface Soil Investigation, Building 88-Former UST F28, Lockheed Plant B-6 (File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed the "Area #8 Subsurface Soil Investigation, Building 88-Former UST F28" report dated October 4, 1996, prepared by your consultant, Tetra Tech Inc. This report documents results of soil assessment to determine petroleum hydrocarbon impact in the area of former jet fuel underground storage tank (UST) F28 located south of Building 88 in the northeast part of Plant B-6. Upon review, we have the following comments with respect to the Well Investigation Program:

1. During the subject phase of assessment, a total of 91 soil samples were collected from 6 boreholes drilled to a maximum depth of 153' bgs in the subject UST area.
2. The highest concentrations of TRPH (total recoverable petroleum hydrocarbons) and TEH (total extractable hydrocarbons) characterized as diesel were detected in soil matrix samples from the 15' to 35' bgs depth interval at 2,100 to 8,100 mg/kg and 1,100 to 5,800 mg/kg, respectively. TRPH and TEH concentrations were either non-detectable or less than 380 mg/kg in deeper samples analyzed. Previous assessment detected lower TPH and TEH concentrations in the subject UST area.
3. Ground water is at approximately 260' bgs in this area.

Based on the subject submittal and other information in our files, we have no further requirements with respect to the Well Investigation Program. Soil contamination detected in this area is not a threat to ground water quality and therefore cleanup is not necessary.

The jurisdictional requirements of other agencies, such as the U.S. Environmental Protection Agency, are not affected by this Board's "no further requirements" decision. Such agencies may choose to make their own determinations regarding the site.

Ron N. Halgerson
Lockheed Martin Corporation
2550 North Hollywood Way, Suite 305
Burbank, California 91505-0256No Further Requirements, Area #6, Building 352 - Former Sewage Sump, Lockheed Plant B-6 (File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed the "Area #6 - Building 352, Former Sewage Sump Report of Results" dated November 21, 1996, prepared by your consultant, Tetra Tech Inc. The report summarizes the results of the remedial excavation for the removal of soil containing polychlorinated biphenyl compounds (PCBs) previously detected at soil boreholes C352-SB73 and C352-SB77 in the subject area. Upon review, we have the following comments with respect to the Well Investigation Program:

1. During this remedial action, approximately 1,000 cubic yards of soil impacted with PCBs exceeding the USEPA Preliminary Remediation Goals (340 ug/kg for PCB) were excavated to a depth of approximately 44' bgs in the subject area. A total of 7 confirmation soil samples from the excavation were collected and analyzed for PCBs, TRPH and extractable hydrocarbons (TEH). The excavated soils were reportedly transported off-site to an approved treatment and disposal facility.
2. PCB (Arocolor-1248) was detected in two confirmation samples at a maximum concentration of 240 ug/kg. No TRPH and TEH were detected in the confirmation samples.
3. Previous investigations in this area detected PCB at concentrations ranging from non-detectable to 1,001 mg/kg in the 5' to 35' bgs depth interval. Concentrations of PCB compounds collected at depths below 35' bgs were either non-detectable or less than 540 ug/kg. Other contaminants previously detected included TRPH (maximum 1,100 mg/kg at 60' bgs) and relatively low concentrations of VOCs (maximum 160 ug/kg PCE at 15'). TRPH concentrations were generally less than 100 mg/kg.
4. Ground water is approximately 260' bgs in this area.

No Further Requirements, Parcel J, Lockheed Plant B-6 West
(File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed your letter dated November 25, 1996, requesting closure for Parcel J at Plant B-6 as notated on the map that accompanied the letter. Upon review of the subject proposal and other information in our files, we have the following comments with respect to the Well Investigation Program:

1. During multiple phases of assessment, approximately 884 soil matrix and 403 soil gas samples were collected at the subject parcel. Based on the results of these investigations, fourteen areas that required further assessment were identified:

- Site No. 5 - Building 84 clarifier
- Site No. 7 - Building 88 - sump and pump lift station
- Site No. 9 - Building 88 - collection sump
- Site No. 10 - Building 352 machine pit #1
- Site No. 11 - Building 82 sand pit
- Site No. 12 - Building 352 machine pit #2
- Site No. 14 - Building 82 - former film tank
- Site No. 15 - Building 82 - northeast parking lot
- Area No. 4 - Building 353 - process line
- Area No. 5 - Building 353 - former TCA degreaser
- Area No. 6 - Building 352 - former sewage sump
- Area No. 7 - Building 88 - former fuel UST
- Area No. 8 - Building 88 - former UST F28
- Area No. 9 - Building 82 - northern parking lot

2. At Sites 5, 7, 9, 10, 11, 12, 14 and 15, further soil assessment was conducted to determine the extent of petroleum hydrocarbon, VOC, PCB and metal impact. Investigation results demonstrated that soil contamination is limited to relatively small areas and shallow depths (<25' bgs). Based on confirmation sampling results, Board staff approved backfilling in July 1996.

LWL2 002270

Ron N. Halgerson
Lockheed Martin Corporation
Page 2

3. Additional subsurface investigation was conducted in Area #4 to delineate the extent of metals impact in the process line within Building 353. Metal concentrations detected in soil samples were below Title 22 TTLC and less than 10 times STLC concentrations and U.S. Environmental Protection Agency (USEPA) Preliminary Remediation Goals (1995). The highest concentration of lead was 16 mg/kg (at 10' bgs). On October 15, 1996, Board staff issued a "no further requirements" letter for this area.
4. Based on supplementary assessment at Area #5 (Building 353 - former TCA degreaser), we issued a "no further requirements" letter on November 20, 1996. 1,1,1-TCA was the primary VOC detected at maximum concentrations of 48 ug/kg (soil matrix) at 15' bgs and 448 ug/L (soil gas) at 30' bgs. The 1,1,1-TCA degreaser containment pit was removed and the area excavated to a depth of 15' bgs.
5. In Area #6, approximately 1,000 cubic yards of soil containing PCBs exceeding the USEPA Preliminary Remediation Goals (340 ug/kg for PCB) were excavated to a depth of approximately 44' bgs. PCB (Arocolor-1248) was detected in two confirmation samples at a maximum concentration of 240 ug/kg. On November 26, 1996, Board staff made a "no further remediation" determination for this area.
6. On October 7 and 10, 1996, Board staff issued "no further requirements" letters for Area #7 and Area #8, respectively. Maximum concentrations of total recoverable petroleum hydrocarbons (TRPH) and total extractable hydrocarbons (TEH) were detected in shallow soils (<10' bgs) in Area #7 at concentrations of 980 mg/kg and 480 mg/kg, respectively. In Area #8, the highest concentrations of TRPH and TEH characterized as diesel were detected in soil samples between 15' and 35' bgs at 2,100 to 8,100 mg/kg and 1,100 to 5,800 mg/kg, respectively.
7. In Area #9, supplementary assessment was conducted to delineate the extent of VOCs. No VOCs were positively detected while maximum TRPH concentration was 310 mg/kg (5' and 10' bgs). Board staff made a "no further requirements" determination for this area on May 9, 1996.

Completion of assessment and cleanup in Parcel J fulfills requirements for closure of Plant B-6. Based on our inspections and information submitted, we have no further requirements with respect to the Well Investigation Program for Parcel J and the entire Plant B-6 facility. Residual soil contamination in this

Lockheed Martin Corporation
Page 3

parcel is not a threat to ground water quality, human health and the environment and therefore further cleanup is not warranted. This parcel and Plant B-6 are therefore excluded from requirements in our Cleanup and Abatement Order No. 87-161.

The jurisdiction requirements of other agencies, such as the U.S. Environmental Protection Agency (USEPA), are not affected by the Board's "no further requirements" determination. Such agencies may choose to make their own determination concerning the site.

If you have any questions, please contact Alex Carlos at (213) 266-7583.

No Further Requirements, Parcel L, Lockheed Plant B-6 West
(File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed your July 10, 1996, letter requesting closure for Parcel L of Plant B-6 as notated on the map that accompanied the letter. Upon review of the subject proposal and other information in our files, we have the following comments with respect to the Well Investigation Program:

1. During multiple phases of assessment on the subject parcel, a total of 11 soil matrix samples were collected and analyzed. Laboratory analysis of these samples detected maximum concentrations of 350 mg/kg TRPH (2' bgs), 45 ug/kg acetone, 10 ug/kg ethylbenzene, 13 ug/kg toluene and 46 ug/kg xylenes. Supplemental sampling demonstrated that the identified soil contamination is limited to shallow depths. Ground water is approximately 210' bgs in this area.
2. Only one shallow (6' bgs) soil gas sample was collected on this subject parcel. Relatively low concentrations of 1,1-DCE (maximum 1.9 ug/l) were detected in the sample.

Based on our inspections and information submitted, we have no further requirements with respect to the Well Investigation Program for the subject parcel. The soil contamination detected on this parcel is not a continuing threat to ground water quality and therefore cleanup is not necessary. This "no further requirements" determination for this parcel does not affect requirements for assessment and cleanup on the other adjacent parcels covered by our Cleanup and Abatement Order No. 87-161. We have no information concerning other conditions that would adversely impact the value or usage of this property. However, additional assessment or remediation may be needed depending on future use of this site.

The jurisdictional requirements of other agencies, such as the U.S. Environmental Protection Agency, are not affected by this Board's "no further requirements" decision. Such agencies may choose to make their own determinations regarding the site.

Ron N. Helgeson
Lockheed Martin Corporation
2550 North Hollywood Way, Suite 305
Burbank, California 91505-0256No Further Requirements, Clarifiers B-6-F, B-6-K and B-6-Z, Lockheed Plant B-6 (File No. 104.0674) (Cleanup & Abatement Order No. 87-161)

We have reviewed the "Closure Report Clarifiers B-6-F, B-6-K and B-6-Z, Lockheed Plant B-6" dated October 29, 1996, prepared by your consultant, Tetra Tech Inc. This report documents removal of the subject clarifiers located at Buildings 360, 353 and 345 within Lockheed Plant B-6. Upon review, we have the following comments with respect to the Well Investigation Program:

1. During this removal action, a total of 6 soil samples (two from each clarifier) were collected from the three clarifier excavations and analyzed for the chemicals contained in the clarifier waste water.
2. No metal concentrations were reported above the Title 22 TTLC or 10 times the STLC. Maximum concentrations of TRPH (total recoverable petroleum hydrocarbons) and TEM (total extractable hydrocarbons) in the diesel range were 180 mg/kg and 28 mg/kg, respectively. No discoloration, odor or other evidence of waste discharges were reported based on visual inspection of the excavations.
3. Ground water is approximately 260' bgs in this area.

Based on the subject submittal and other information in our files, we have no further requirements with respect to the Well Investigation Program. Soil contamination detected in the subject areas is not a threat to ground water quality and therefore cleanup is not warranted.

The jurisdictional requirements of other agencies, such as the U.S. Environmental Protection Agency, are not affected by this Board's "no further requirements" decision. Such agencies may choose to make their own determinations regarding the site.

PRELIMINARY REPORT

In response to the above referenced application for a policy of title insurance, this company hereby reports that it is prepared to issue, or cause to be issued, as of the date hereof, a Policy or Policies of Title Insurance describing the land and the estate or interest therein hereinafter set forth, insuring against loss which may be sustained by reason of any defect, lien or encumbrance not shown or referred to as an Exception below or not excluded from coverage pursuant to the printed Schedules, Conditions and Stipulations of said Policy forms.

The printed Exceptions and Exclusions from the coverage and Limitations on Covered Risks of said policy or policies are set forth in Exhibit A attached. *The policy to be issued may contain an arbitration clause. When the Amount of Insurance is less than that set forth in the arbitration clause, all arbitrable matters shall be arbitrated at the option of either the Company or the Insured as the exclusive remedy of the parties.* Limitations on Covered Risks applicable to the CLTA and ALTA Homeowner's Policies of Title Insurance which establish a Deductible Amount and a Maximum Dollar Limit of Liability for certain coverages are also set forth in Exhibit A. Copies of the policy forms should be read. They are available from the office which issued this report.

Please read the exceptions shown or referred to below and the exceptions and exclusions set forth in Exhibit A of this report carefully. The exceptions and exclusions are meant to provide you with notice of matters which are not covered under the terms of the title insurance policy and should be carefully considered.

It is important to note that this preliminary report is not a written representation as to the condition of title and may not list all liens, defects, and encumbrances affecting title to the land.

This report (and any supplements or amendments hereto) is issued solely for the purpose of facilitating the issuance of a policy of title insurance and no liability is assumed hereby. If it is desired that liability be assumed prior to the issuance of a policy of title insurance, a Binder or Commitment should be requested.

Dated as of October 20, 2015 at 7:30 A.M.

The form of Policy of title insurance contemplated by this report is:

- ALTA Extended Owner Policy
- ALTA Extended Loan Policy

A specific request should be made if another form or additional coverage is desired.

Title to said estate or interest at the date hereof is vested in:

The Bank of New York Trust Company, N.A., a national banking association, Trustee

The estate or interest in the land hereinafter described or referred to covered by this Report is:

Fee Simple

The Land referred to herein is described as follows:

(See attached Legal Description)

At the date hereof exceptions to coverage in addition to the printed Exceptions and Exclusions in said policy form would be as follows:

1. General and special taxes and assessments for the fiscal year 2016-2017, a lien not yet due or payable.
2. General and special taxes and assessments for the fiscal year 2015-2016 are exempt. If the exempt status is terminated an additional tax may be levied. APN(S): 2466-011-908, 2466-011-909, portion of 2466-011-910 and all of APNS: 2466-011-911; 2466-028-907 and 2466-028-908.
3. The lien of supplemental taxes, if any, assessed pursuant to Chapter 3.5 commencing with Section 75 of the California Revenue and Taxation Code.
4. Water rights, claims or title to water, whether or not shown by the public records.
5. Easement(s) for the purposes(s) shown below and rights incidental thereto as set forth in a document:

Purpose:	Pipe lines
Recording Date:	June 14, 1926
Recording No:	775 in Book 5697, Page 143 , of Official Records
Affects:	Portions of the Land, the exact location of which can be determined by examination of the above-mentioned instrument, which contains a complete legal description of the affected portions of said Land.

Reference is hereby made to said document for full particulars.

6. Easement(s) for the purposes(s) shown below and rights incidental thereto as set forth in a document:

Purpose: Pipe lines
Recording Date: March 11, 1929
Recording No: 925 in [Book 7425, Page 306](#), of Official Records
Affects: Portions of the Land, the exact location of which can be determined by examination of the above-mentioned instrument, which contains a complete legal description of the affected portions of said Land.

Reference is hereby made to said document for full particulars.

7. Easement(s) for the purposes(s) shown below and rights incidental thereto as set forth in a document:

Purpose: Pipe lines
Recording Date: March 11, 1929
Instrument No: 926 in [Book 7428, Page 249](#), of Official Records
Affects: Portions of the Land, the exact location of which can be determined by examination of the above-mentioned instrument, which contains a complete legal description of the affected portions of said Land.

Reference is hereby made to said document for full particulars.

8. Easement(s) for the purposes(s) shown below and rights incidental thereto as set forth in a document:

Purpose: Pipe lines
Recording Date: January 23, 1930
Recording No: in [Book 9602, Page 380](#), of Official Records
Affects: Portions of the Land, the exact location of which can be determined by examination of the above-mentioned instrument, which contains a complete legal description of the affected portions of said Land.

Reference is hereby made to said document for full particulars.

and Recording Date: January 23, 1930
and Recording No: 979 in [Book 9704, Page 139](#), of Official Records

9. An easement affecting that portion of said land included within the vacated portion of Winona Avenue extending from Westerly line of Hollywood Way, 100 feet wide, to the Southerly prolongation of the Westerly line of Maple Street, 30 feet wide, now vacated, for public utility purposes, as reserved by the City of Burbank, in Resolution of Intention No. 2031, adopted

October 23, 1941, accepted by Resolution No. 2058 on December 02, 1941, and as reserved by the City of Burbank, in Resolution of Intention No. 1932, adopted May 13, 1941, accepted by Resolution No. 1965 on June 24, 1991, certified copies thereof being recorded July 29, 1953 as Instrument No. 2298 in [Book 42336, Page 73](#), Official Records, and recorded March 29, 1954 as Instrument No. 3516 in [Book 44190, Page 277](#), Official Records.

10. Easement(s) for the purposes(s) shown below and rights incidental thereto as set forth in a document:

Purpose: Public utilities
 Recording Date: January 29, 1942
 Recording No: 1216 in [Book 19078, Page 140](#), of Official Records
 Affects: Portions of the Land, the exact location of which can be determined by examination of the above-mentioned instrument, which contains a complete legal description of the affected portions of said Land.

Reference is hereby made to said document for full particulars.

11. Easement(s) for the purpose(s) shown below and rights incidental thereto as delineated or as offered for dedication, on the map of said Tract No. 11663 recorded in [Book 257, Page 36](#) of Maps;

Purpose: Sanitary sewers and public utilities
 Affects: That portion of said land included within the Northerly 15, feet of Lot 1 of Tract No. 11663.

12. Easement(s) for the purposes(s) shown below and rights incidental thereto as set forth in a document:

Purpose: Public utilities
 Recording Date: February 26, 1942
 Recording No: 1495 in [Book 19107, Page 395](#), of Official Records
 Affects: That portion of said land included within the Northerly 15 feet of Lot 1 of Tract No. 11663.

Reference is hereby made to said document for full particulars.

The interest of the City of Burbank under and by virtue of said deed, insofar as said interest affects that portion of said land extending Easterly from Westerly line of Screenland Drive, as shown on said Tract No. 6949, as per map recorded in [Book 142, Page 57](#) of Maps, to a line parallel to and distant Westerly 3 feet measured at right angles from the center line of Pepper Street (60 feet wide), as shown on said Tract No. 6949, (now vacated by Resolution No. 2356, by Council of the City of Burbank), was quitclaimed to the then record owner, by a deed recorded May 15, 1945 as Instrument No. 1195 in [Book 21861, Page 382](#), Official Records.

13. Easement(s) for the purpose(s) shown below and rights incidental thereto as set forth in a document:

Purpose: Pipe lines
Recording Date: August 27, 1942
Instrument No: 861 in [Book 19498, Page 304](#), of Official Records
Affects: Portions of the Land, the exact location of which can be determined by examination of the above-mentioned instrument, which contains a complete legal description of the affected portions of said Land.

Reference is hereby made to said document for full particulars.

14. Easement(s) for the purpose(s) shown below and rights incidental thereto as set forth in a document:

Purpose: Aerial and underground telephone, telegraph and communication structures
Recording Date: March 28, 1944
Instrument No: 1068 in [Book 20800, Page 152](#), of Official Records
Affects: Said land.

Reference is hereby made to said document for full particulars.

Among other things, said document provides for:

That the location and arrangement of all telephone facilities placed thereon shall be approved by the communications engineer of Lockheed Aircraft Corporation.

15. Easement(s) for the purpose(s) shown below and rights incidental thereto as set forth in a document:

Purpose: Ingress and egress
Recording Date: November 29, 1946
Recording No: 1593 in [Book 24014, Page 73](#), of Official Records
Affects: Portions of the Land, the exact location of which can be determined by examination of the above-mentioned instrument, which contains a complete legal description of the affected portions of said Land.

Reference is hereby made to said document for full particulars.

and Recording Date: December 23, 1946
and Recording No: 636 in [Book 23928, Page 448](#), of Official Records.

16. Easement(s) for the purpose(s) shown below and rights incidental thereto as set forth in a document:

Purpose: Public utilities
Recording Date: May 01, 1947
Recording No: 1961 in [Book 24487, Page 272](#), of Official Records

Affects: Portions of the Land, the exact location of which can be determined by examination of the above-mentioned instrument, which contains a complete legal description of the affected portions of said Land.

Reference is hereby made to said document for full particulars.

17. Easement(s) for the purpose(s) shown below and rights incidental thereto as set forth in a document:

Purpose: Public utilities
Recording Date: May 01, 1947
Recording No: 1962 in [Book 24452, Page 156](#), of Official Records
Affects: Portions of the Land, the exact location of which can be determined by examination of the above-mentioned instrument, which contains a complete legal description of the affected portions of said Land.

Reference is hereby made to said document for full particulars.

Recorded on May 07, 1962 as Instrument No. 3299 in [Book M-1006, Page 624](#), Official Records, appears an application and a permit for an encroachment of that certain switchgear building 5 feet into the Easterly 20 feet of the Westerly 40 feet of the above described easement, upon the terms, covenants and conditions therein set forth.

18. Easement(s) for the purpose(s) shown below and rights incidental thereto as set forth in a document:

Purpose: Public utilities
Recording Date: May 01, 1947
Recording No: 1963 in [Book 24529, Page 125](#), of Official Records
Affects: That portion of said land included within Lot 1 of Tract No. 11663, as described therein.

Reference is hereby made to said document for full particulars.

19. Easement(s) for the purpose(s) shown below and rights incidental thereto as set forth in a document:

Purpose: Utilities
Recording Date: August 28, 1947
Recording No: in [Book 24983, Page 174](#), of Official Records
Affects: Portions of the Land, the exact location of which can be determined by examination of the above-mentioned instrument, which contains a complete legal description of the affected portions of said Land.

Reference is hereby made to said document for full particulars.

20. Easement(s) for the purpose(s) shown below and rights incidental thereto as set forth in a document:

Purpose: Public utilities
Recording Date: September 16, 1947
Recording No: 2978 in [Book 25140, Page 276](#), of Official Records
Affects: A parcel of land, 10.00 feet in width, as described therein.

Reference is hereby made to said document for full particulars.

21. Easement(s) for the purpose(s) shown below and rights incidental thereto as set forth in a document:

Purpose: Sewer
Recording Date: May 18, 1948
Recording No: 2550 in [Book 27229, Page 1](#), of Official Records
Affects: Portions of the Land, the exact location of which can be determined by examination of the above-mentioned instrument, which contains a complete legal description of the affected portions of said Land.

Reference is hereby made to said document for full particulars.

22. Easement(s) for the purpose(s) shown below and rights incidental thereto as set forth in a document:

Purpose: Sewers
Recording Date: June 28, 1948
Recording No: 2121 in [Book 27553, Page 268](#), of Official Records
Affects: Portions of the Land, the exact location of which can be determined by examination of the above-mentioned instrument, which contains a complete legal description of the affected portions of said Land.

Reference is hereby made to said document for full particulars.

INFORMATIONAL NOTES

1. According to the latest available equalized assessment roll in the office of the county tax assessor, there is located on the land a Airport and Parking Lot known as 2555 No. Hollywood Way; 3525 and 3615 No. San Fernando Boulevard, Burbank, California.
2. According to the public records, there has been no conveyance of the land within a period of twenty-four months prior to the date of this report, except as follows:

None
3. We find no open deeds of trust. Escrow please confirm before closing.
4. If this preliminary report/commitment was prepared based upon an application for a policy of title insurance that identified land by street address or assessor's parcel number only, it is the responsibility of the applicant to determine whether the land referred to herein is in fact the land that is to be described in the policy or policies to be issued.
5. Should this report be used to facilitate your transaction, we must be provided with the following prior to the issuance of the policy:
 - A. WITH RESPECT TO A CORPORATION:
 1. A certificate of good standing of recent date issued by the Secretary of State of the corporation's state of domicile.
 2. A certificate copy of a resolution of the Board of Directors authorizing the contemplated transaction and designating which corporate officers shall have the power to execute on behalf of the corporation.
 3. Requirements which the Company may impose following its review of the above material and other information which the Company may require.
 - B. WITH RESPECT TO A CALIFORNIA LIMITED PARTNERSHIP:
 1. A certified copy of the certificate of limited partnership (form LP-1) and any amendments thereto (form LP-2) to be recorded in the public records;
 2. A full copy of the partnership agreement and any amendments;
 3. Satisfactory evidence of the consent of a majority in interest of the limited partners to the contemplated transaction;
 4. Requirements which the Company may impose following its review of the above material and other information which the Company may require.
 - C. WITH RESPECT TO A FOREIGN LIMITED PARTNERSHIP:
 1. A certified copy of the application for registration, foreign limited partnership (form LP-5) and any amendments thereto (form LP-6) to be recorded in the public records;
 2. A full copy of the partnership agreement and any amendment;
 3. Satisfactory evidence of the consent of a majority in interest of the limited partners to the contemplated transaction;
 4. Requirements which the Company may impose following its review of the above material and other information which the Company may require.
 - D. WITH RESPECT TO A GENERAL PARTNERSHIP:

1. A certified copy of a statement of partnership authority pursuant to Section 16303 of the California Corporation Code (form GP-1), executed by at least two partners, and a certified copy of any amendments to such statement (form GP-7), to be recorded in the public records;
 2. A full copy of the partnership agreement and any amendments;
 3. Requirements which the Company may impose following its review of the above material required herein and other information which the Company may require.
- E. WITH RESPECT TO A LIMITED LIABILITY COMPANY:
1. A copy of its operating agreement and any amendments thereto;
 2. If it is a California limited liability company, a certified copy of its articles of organization (LLC-1) and any certificate of correction (LLC-11), certificate of amendment (LLC-2), or restatement of articles of organization (LLC-10) to be recorded in the public records;
 3. If it is a foreign limited liability company, a certified copy of its application for registration (LLC-5) to be recorded in the public records;
 4. With respect to any deed, deed of trust, lease, subordination agreement or other document or instrument executed by such limited liability company and presented for recordation by the Company or upon which the Company is asked to rely, such document or instrument must be executed in accordance with one of the following, as appropriate:
 - (i) If the limited liability company properly operates through officers appointed or elected pursuant to the terms of a written operating agreement, such documents must be executed by at least two duly elected or appointed officers, as follows: the chairman of the board, the president or any vice president, and any secretary, assistant secretary, the chief financial officer or any assistant treasurer;
 - (ii) If the limited liability company properly operates through a manager or managers identified in the articles of organization and/or duly elected pursuant to the terms of a written operating agreement, such document must be executed by at least two such managers or by one manager if the limited liability company properly operates with the existence of only one manager.
 5. Requirements which the Company may impose following its review of the above material and other information which the Company may require.
- F. WITH RESPECT TO A TRUST:
1. A certification pursuant to Section 18100.5 of the California Probate Code in a form satisfactory to the Company.
 2. Copies of those excerpts from the original trust documents and amendments thereto which designate the trustee and confer upon the trustee the power to act in the pending transaction.
 3. Other requirements which the Company may impose following its review of the material require herein and other information which the Company may require.
- G. WITH RESPECT TO INDIVIDUALS:
1. A statement of information.

The map attached, if any, may or may not be a survey of the land depicted hereon. First American Title Insurance Company expressly disclaims any liability for loss or damage which may result from reliance on this map except to the extent coverage for such loss or damage is expressly provided by the terms and provisions of the title insurance policy, if any, to which this map is attached.

The First American Corporation
First American Title Company
Privacy Policy

We Are Committed to Safeguarding Customer Information

In order to better serve your needs now and in the future, we may ask you to provide us with certain information. We understand that you may be concerned about what we will do with such information - particularly any personal or financial information. We agree that you have a right to know how we will utilize the personal information you provide to us. Therefore, together with our parent company, The First American Corporation, we have adopted this Privacy Policy to govern the use and handling of your personal information.

Applicability

This Privacy Policy governs our use of the information which you provide to us. It does not govern the manner in which we may use information we have obtained from any other source, such as information obtained from a public record or from another person or entity. First American has also adopted broader guidelines that govern our use of personal information regardless of its source. First American calls these guidelines its Fair Information Values, a copy of which can be found on our website at www.firstam.com.

Types of Information

Depending upon which of our services you are utilizing, the types of nonpublic personal information that we may collect include:

- Information we receive from you on applications, forms and in other communications to us, whether in writing, in person, by telephone or any other means;
- Information about your transactions with us, our affiliated companies, or others; and
- Information we receive from a consumer reporting agency.

Use of Information

We request information from you for our own legitimate business purposes and not for the benefit of any nonaffiliated party. Therefore, we will not release your information to nonaffiliated parties except: (1) as necessary for us to provide the product or service you have requested of us; or (2) as permitted by law. We may, however, store such information indefinitely, including the period after which any customer relationship has ceased. Such information may be used for any internal purpose, such as quality control efforts or customer analysis. We may also provide all of the types of nonpublic personal information listed above to one or more of our affiliated companies. Such affiliated companies include financial service providers, such as title insurers, property and casualty insurers, and trust and investment advisory companies, or companies involved in real estate services, such as appraisal companies, home warranty companies, and escrow companies. Furthermore, we may also provide all the information we collect, as described above, to companies that perform marketing services on our behalf, on behalf of our affiliated companies, or to other financial institutions with whom we or our affiliated companies have joint marketing agreements.

Former Customers

Even if you are no longer our customer, our Privacy Policy will continue to apply to you.

Confidentiality and Security

We will use our best efforts to ensure that no unauthorized parties have access to any of your information. We restrict access to nonpublic personal information about you to those individuals and entities who need to know that information to provide products or services to you. We will use our best efforts to train and oversee our employees and agents to ensure that your information will be handled responsibly and in accordance with this Privacy Policy and First American's Fair Information Values. We currently maintain physical, electronic, and procedural safeguards that comply with federal regulations to guard your nonpublic personal information.

**CLTA/ALTA HOMEOWNER'S POLICY OF TITLE INSURANCE (02-03-10)
EXCLUSIONS**

In addition to the Exceptions in Schedule B, You are not insured against loss, costs, attorneys' fees, and expenses resulting from:

- 1. Governmental police power, and the existence or violation of those portions of any law or government regulation concerning:
 - (a) building;
 - (b) zoning;
 - (c) land use;
 - (d) improvements on the Land;
 - (e) land division; and
 - (f) environmental protection.

This Exclusion does not limit the coverage described in Covered Risk 8.a., 14, 15, 16, 18, 19, 20, 23 or 27.

- 2. The failure of Your existing structures, or any part of them, to be constructed in accordance with applicable building codes. This Exclusion does not limit the coverage described in Covered Risk 14 or 15.
- 3. The right to take the Land by condemning it. This Exclusion does not limit the coverage described in Covered Risk 17.
- 4. Risks:
 - (a) that are created, allowed, or agreed to by You, whether or not they are recorded in the Public Records;
 - (b) that are Known to You at the Policy Date, but not to Us, unless they are recorded in the Public Records at the Policy Date;
 - (c) that result in no loss to You; or
 - (d) that first occur after the Policy Date - this does not limit the coverage described in Covered Risk 7, 8.e., 25, 26, 27 or 28.
- 5. Failure to pay value for Your Title.
- 6. Lack of a right:
 - (a) to any land outside the area specifically described and referred to in paragraph 3 of Schedule A; and
 - (b) in streets, alleys, or waterways that touch the Land.
 This Exclusion does not limit the coverage described in Covered Risk 11 or 21.
- 7. The transfer of the Title to You is invalid as a preferential transfer or as a fraudulent transfer or conveyance under federal bankruptcy, state insolvency, or similar creditors' rights laws.

LIMITATIONS ON COVERED RISKS

Your insurance for the following Covered Risks is limited on the Owner's Coverage Statement as follows: For Covered Risk 16, 18, 19, and 21 Your Deductible Amount and Our Maximum Dollar Limit of Liability shown in Schedule A.

<u>Your Deductible Amount</u>	<u>Our Maximum Dollar Limit of Liability</u>
Covered Risk 16: 1% of Policy Amount or \$2,500.00 (whichever is less)	\$10,000.00
Covered Risk 18: 1% of Policy Amount or \$5,000.00 (whichever is less)	\$25,000.00
Covered Risk 19: 1% of Policy Amount or \$5,000.00 (whichever is less)	\$25,000.00
Covered Risk 21: 1% of Policy Amount or \$2,500.00 (whichever is less)	\$5,000.00

**ALTA RESIDENTIAL TITLE INSURANCE POLICY (6-1-87)
EXCLUSIONS**

In addition to the Exceptions in Schedule B, you are not insured against loss, costs, attorneys' fees, and expenses resulting from:

- 1. Governmental police power, and the existence or violation of any law or government regulation. This includes building and zoning ordinances and also laws and regulations concerning:
 - (a) and use
 - (b) improvements on the land
 - (c) and division
 - (d) environmental protection

This exclusion does not apply to violations or the enforcement of these matters which appear in the public records at Policy Date.

This exclusion does not limit the zoning coverage described in Items 12 and 13 of Covered Title Risks.

- 2. The right to take the land by condemning it, unless:
 - (a) a notice of exercising the right appears in the public records on the Policy Date
 - (b) the taking happened prior to the Policy Date and is binding on you if you bought the land without knowing of the taking

3. Title Risks:
 - (a) that are created, allowed, or agreed to by you
 - (b) that are known to you, but not to us, on the Policy Date -- unless they appeared in the public records
 - (c) that result in no loss to you
 - (d) that first affect your title after the Policy Date -- this does not limit the labor and material lien coverage in Item 8 of Covered Title Risks
4. Failure to pay value for your title.
5. Lack of a right:
 - (a) to any land outside the area specifically described and referred to in Item 3 of Schedule A OR
 - (b) in streets, alleys, or waterways that touch your land

This exclusion does not limit the access coverage in Item 5 of Covered Title Risks.

2006 ALTA LOAN POLICY (06-17-06)
EXCLUSIONS FROM COVERAGE

The following matters are expressly excluded from the coverage of this policy, and the Company will not pay loss or damage, costs, attorneys' fees, or expenses that arise by reason of:

1. a. Any law, ordinance, permit, or governmental regulation (including those relating to building and zoning) restricting, regulating, prohibiting, or relating to
 - i. the occupancy, use, or enjoyment of the Land;
 - ii. the character, dimensions, or location of any improvement erected on the Land;
 - iii. the subdivision of land; or
 - iv. environmental protection;

or the effect of any violation of these laws, ordinances, or governmental regulations. This Exclusion 1(a) does not modify or limit the coverage provided under Covered Risk 5.
- b. Any governmental police power. This Exclusion 1(b) does not modify or limit the coverage provided under Covered Risk 6.
2. Rights of eminent domain. This Exclusion does not modify or limit the coverage provided under Covered Risk 7 or 8.
3. Defects, liens, encumbrances, adverse claims, or other matters
 - a. created, suffered, assumed, or agreed to by the Insured Claimant;
 - b. not Known to the Company, not recorded in the Public Records at Date of Policy, but Known to the Insured Claimant and not disclosed in writing to the Company by the Insured Claimant prior to the date the Insured Claimant became an Insured under this policy;
 - c. resulting in no loss or damage to the Insured Claimant;
 - d. attaching or created subsequent to Date of Policy (however, this does not modify or limit the coverage provided under Covered Risk 11, 13, or 14); or
 - e. resulting in loss or damage that would not have been sustained if the Insured Claimant had paid value for the Insured Mortgage.
4. Unenforceability of the lien of the Insured Mortgage because of the inability or failure of an Insured to comply with applicable doing-business laws of the state where the Land is situated.
5. Invalidity or unenforceability in whole or in part of the lien of the Insured Mortgage that arises out of the transaction evidenced by the Insured Mortgage and is based upon usury or any consumer credit protection or truth-in-lending law.
6. Any claim, by reason of the operation of federal bankruptcy, state insolvency, or similar creditors' rights laws, that the transaction creating the lien of the Insured Mortgage, is
 - a. a fraudulent conveyance or fraudulent transfer, or
 - b. a preferential transfer for any reason not stated in Covered Risk 13(b) of this policy.
7. Any lien on the Title for real estate taxes or assessments imposed by governmental authority and created or attaching between Date of Policy and the date of recording of the Insured Mortgage in the Public Records. This Exclusion does not modify or limit the coverage provided under Covered Risk 11(b).

The above policy form may be issued to afford either Standard Coverage or Extended Coverage. In addition to the above Exclusions from Coverage, the Exceptions from Coverage in a Standard Coverage policy will also include the following Exceptions from Coverage:

EXCEPTIONS FROM COVERAGE

This policy does not insure against loss or damage (and the Company will not pay costs, attorneys' fees or expenses) that arise by reason of:

1. (a) Taxes or assessments that are not shown as existing liens by the records of any taxing authority that levies taxes or assessments on real property or by the Public Records; (b) proceedings by a public agency that may result in taxes or assessments, or notices of such proceedings, whether or not shown by the records of such agency or by the Public Records.
2. Any facts, rights, interests, or claims that are not shown by the Public Records but that could be ascertained by an inspection of the Land or that may be asserted by persons in possession of the Land.
3. Easements, liens or encumbrances, or claims thereof, not shown by the Public Records.
4. Any encroachment, encumbrance, violation, variation, or adverse circumstance affecting the Title that would be disclosed by an accurate and complete land survey of the Land and not shown by the Public Records.
5. (a) Unpatented mining claims; (b) reservations or exceptions in patents or in Acts authorizing the issuance thereof; (c) water rights, claims or title to water, whether or not the matters excepted under (a), (b), or (c) are shown by the Public Records.
6. Any lien or right to a lien for services, labor or material not shown by the public records.

2006 ALTA OWNER'S POLICY (06-17-06)
EXCLUSIONS FROM COVERAGE

The following matters are expressly excluded from the coverage of this policy, and the Company will not pay loss or damage, costs, attorneys' fees, or expenses that arise by reason of:

1. a. Any law, ordinance, permit, or governmental regulation (including those relating to building and zoning) restricting, regulating, prohibiting, or relating to
 - i. the occupancy, use, or enjoyment of the Land;
 - ii. the character, dimensions, or location of any improvement erected on the Land;
 - iii. the subdivision of land; or
 - iv. environmental protection;

or the effect of any violation of these laws, ordinances, or governmental regulations. This Exclusion 1(a) does not modify or limit the coverage provided under Covered Risk 5.

b. Any governmental police power. This Exclusion 1(b) does not modify or limit the coverage provided under Covered Risk 6.
2. Rights of eminent domain. This Exclusion does not modify or limit the coverage provided under Covered Risk 7 or 8.
3. Defects, liens, encumbrances, adverse claims, or other matters
 - a. created, suffered, assumed, or agreed to by the Insured Claimant;
 - b. not known to the Company, not recorded in the Public Records at Date of Policy, but known to the Insured Claimant and not disclosed in writing to the Company by the Insured Claimant prior to the date the Insured Claimant became an Insured under this policy;
 - c. resulting in no loss or damage to the Insured Claimant;
 - d. attaching or created subsequent to Date of Policy (however, this does not modify or limit the coverage provided under Covered Risk 11, 13, or 14); or
 - e. resulting in loss or damage that would not have been sustained if the Insured Claimant had paid value for the Insured Mortgage.
4. Unenforceability of the lien of the Insured Mortgage because of the inability or failure of an Insured to comply with applicable doing-business laws of the state where the Land is situated.
5. Invalidity or unenforceability in whole or in part of the lien of the Insured Mortgage that arises out of the transaction evidenced by the Insured Mortgage and is based upon usury or any consumer credit protection or truth-in-lending law.
6. Any claim, by reason of the operation of federal bankruptcy, state insolvency, or similar creditors' rights laws, that the transaction creating the lien of the Insured Mortgage, is
 - a. a fraudulent conveyance or fraudulent transfer, or
 - b. a preferential transfer for any reason not stated in Covered Risk 13(b) of this policy.
7. Any lien on the Title for real estate taxes or assessments imposed by governmental authority and created or attaching between Date of Policy and the date of recording of the Insured Mortgage in the Public Records. This Exclusion does not modify or limit the coverage provided under Covered Risk 11(b).

The above policy form may be issued to afford either Standard Coverage or Extended Coverage. In addition to the above Exclusions from Coverage, the Exceptions from Coverage in a Standard Coverage policy will also include the following Exceptions from Coverage:

EXCEPTIONS FROM COVERAGE

This policy does not insure against loss or damage (and the Company will not pay costs, attorneys' fees or expenses) that arise by reason of:

1. (a) Taxes or assessments that are not shown as existing liens by the records of any taxing authority that levies taxes or assessments on real property or by the Public Records; (b) proceedings by a public agency that may result in taxes or assessments, or notices of such proceedings, whether or not shown by the records of such agency or by the Public Records.
2. Any facts, rights, interests, or claims that are not shown by the Public Records but that could be ascertained by an inspection of the Land or that may be asserted by persons in possession of the Land.
3. Easements, liens or encumbrances, or claims thereof, not shown by the Public Records.
4. Any encroachment, encumbrance, violation, variation, or adverse circumstance affecting the Title that would be disclosed by an accurate and complete land survey of the Land and not shown by the Public Records.
5. (a) Unpatented mining claims; (b) reservations or exceptions in patents or in Acts authorizing the issuance thereof; (c) water rights, claims or title to water, whether or not the matters excepted under (a), (b), or (c) are shown by the Public Records.
6. Any lien or right to a lien for services, labor or material not shown by the public records.

ALTA EXPANDED COVERAGE RESIDENTIAL LOAN POLICY (07-26-10)
EXCLUSIONS FROM COVERAGE

The following matters are expressly excluded from the coverage of this policy, and the Company will not pay loss or damage, costs, attorneys' fees, or expenses that arise by reason of:

1. a. Any law, ordinance, permit, or governmental regulation (including those relating to building and zoning) restricting, regulating, prohibiting, or relating to
 - i. the occupancy, use, or enjoyment of the Land;
 - ii. the character, dimensions, or location of any improvement erected on the Land;
 - iii. the subdivision of land; or
 - iv. environmental protection;

or the effect of any violation of these laws, ordinances, or governmental regulations. This Exclusion 1(a) does not modify or limit the coverage provided under Covered Risk 5, 6, 13(c), 13(d), 14 or 16.
- b. Any governmental police power. This Exclusion 1(b) does not modify or limit the coverage provided under Covered Risk 5, 6, 13(c), 13(d), 14 or 16.
2. Rights of eminent domain. This Exclusion does not modify or limit the coverage provided under Covered Risk 7 or 8.
3. Defects, liens, encumbrances, adverse claims, or other matters
 - a. created, suffered, assumed, or agreed to by the Insured Claimant;
 - b. not Known to the Company, not recorded in the Public Records at Date of Policy, but Known to the Insured Claimant and not disclosed in writing to the Company by the Insured Claimant prior to the date the Insured Claimant became an Insured under this policy;
 - c. resulting in no loss or damage to the Insured Claimant;
 - d. attaching or created subsequent to Date of Policy (however, this does not modify or limit the coverage provided under Covered Risk 11, 16, 17, 18, 19, 20, 21, 22, 23, 24, 27 or 28); or
 - e. resulting in loss or damage that would not have been sustained if the Insured Claimant had paid value for the Insured Mortgage.
4. Unenforceability of the lien of the Insured Mortgage because of the inability or failure of an Insured to comply with applicable doing-business laws of the state where the Land is situated.
5. Invalidity or unenforceability in whole or in part of the lien of the Insured Mortgage that arises out of the transaction evidenced by the Insured Mortgage and is based upon usury or any consumer credit protection or truth-in-lending law. This Exclusion does not modify or limit the coverage provided in Covered Risk 26.
6. Any claim of invalidity, unenforceability or lack of priority of the lien of the Insured Mortgage as to Advances or modifications made after the Insured has Knowledge that the vestee shown in Schedule A is no longer the owner of the estate or interest covered by this policy. This Exclusion does not modify or limit the coverage provided in Covered Risk 11.
7. Any lien on the Title for real estate taxes or assessments imposed by governmental authority and created or attaching subsequent to Date of Policy. This Exclusion does not modify or limit the coverage provided in Covered Risk 11(b) or 25.
8. The failure of the residential structure, or any portion of it, to have been constructed before, on or after Date of Policy in accordance with applicable building codes. This Exclusion does not modify or limit the coverage provided in Covered Risk 5 or 6.
9. Any claim, by reason of the operation of federal bankruptcy, state insolvency, or similar creditors' rights laws, that the transaction creating the lien of the Insured Mortgage, is
 - a. a fraudulent conveyance or fraudulent transfer, or
 - b. a preferential transfer for any reason not stated in Covered Risk 27(b) of this policy.

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.

Please contact EDR at 1-800-352-0050
with any questions or comments.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

EXECUTIVE SUMMARY

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.

Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: Also known as Superfund, the National Priority List database is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund program. The source of this database is the U.S. EPA.

A review of the NPL list, as provided by EDR, and dated 03/26/2015 has revealed that there is 1 NPL site within approximately 1 mile of the target property.

<u>Equal/Higher Elevation</u>	<u>Address</u>	<u>Direction / Distance</u>	<u>Map ID</u>	<u>Page</u>
<i>SAN FERNANDO VALLEY</i>	<i>NORTH HOLLYWOOD WELL</i>	<i>0 - 1/8 (0.000 mi.)</i>	<i>0</i>	<i>8</i>

Federal CERCLIS list

CERCLIS: The Comprehensive Environmental Response, Compensation and Liability Information System contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the CERCLIS list, as provided by EDR, and dated 10/25/2013 has revealed that there is 1 CERCLIS site within approximately 0.5 miles of the target property.

<u>Equal/Higher Elevation</u>	<u>Address</u>	<u>Direction / Distance</u>	<u>Map ID</u>	<u>Page</u>
<i>SAN FERNANDO VALLEY</i>	<i>NORTH HOLLYWOOD WELL</i>	<i>0 - 1/8 (0.000 mi.)</i>	<i>0</i>	<i>8</i>

Federal CERCLIS NFRAP site List

CERC-NFRAP: Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List

EXECUTIVE SUMMARY

(NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

A review of the CERC-NFRAP list, as provided by EDR, and dated 10/25/2013 has revealed that there are 6 CERC-NFRAP sites within approximately 0.5 miles of the target property.

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 06/09/2015 has revealed that there is 1 CORRACTS site within approximately 1 mile of the target property.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-TSDF list, as provided by EDR, and dated 06/09/2015 has revealed that there is 1 RCRA-TSDF site within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 06/09/2015 has revealed that there are 5 RCRA-LQG sites within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 06/09/2015 has revealed that there are 28 RCRA-SQG sites within approximately 0.25 miles of the target property.

Federal institutional controls / engineering controls registries

US ENG CONTROLS: A listing of sites with engineering controls in place.

A review of the US ENG CONTROLS list, as provided by EDR, and dated 09/10/2015 has revealed that there is 1 US ENG CONTROLS site within approximately 0.5 miles of the target property.

<u>Equal/Higher Elevation</u>	<u>Address</u>	<u>Direction / Distance</u>	<u>Map ID</u>	<u>Page</u>
SAN FERNANDO VALLEY	NORTH HOLLYWOOD WELL	0 - 1/8 (0.000 mi.)	0	8

US INST CONTROL: A listing of sites with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

A review of the US INST CONTROL list, as provided by EDR, and dated 09/10/2015 has revealed that there is 1 US INST CONTROL site within approximately 0.5 miles of the target property.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifies sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 08/03/2015 has revealed that there are 19 ENVIROSTOR sites within approximately 1 mile of the target property.

EXECUTIVE SUMMARY

State and tribal registered storage tank lists

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, and dated 09/14/2015 has revealed that there are 5 UST sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

Local Lists of Registered Storage Tanks

SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there are 15 SWEEPS UST sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 06/09/2015 has revealed that there are 4 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

HAZNET: The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000-1,000,000 annually, representing approximately 350,000-500,000 shipments. Data from non-California manifests & continuation sheets are not included at the present time. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source is the Department of Toxic Substance Control is the agency. This database begins with calendar year 1993.

A review of the HAZNET list, as provided by EDR, and dated 12/31/2013 has revealed that there are 2 HAZNET sites within approximately 0.001 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR US Hist Auto Stat: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR US Hist Auto Stat list, as provided by EDR, has revealed that there are 2 EDR US Hist Auto Stat sites within approximately 0.125 miles of the target property.

Summary Details:

Conditions at proposal October 15, 1984): San Fernando Valley Area 1) is an area of contaminated ground water in the vicinity of the North Hollywood section of the City of Los Angeles, Los Angeles County, California. This area is part of the San Fernando Valley Basin, a natural underground reservoir that represents an important source of drinking water for at least 3 million people in the Los Angeles metropolitan area. The contaminated ground water, which underlies an area of approximately 5,156 acres, contains trichloroethylene (TCE) and perchloroethylene (PCE), and to a lesser extent, carbon tetrachloride and chloroform, according to analyses conducted by the California Department of Health Services, as well as numerous local government agencies. The State's recommended drinking water guideline for TCE and PCE (5 and 4 parts per billion respectively) are exceeded in a number of public wells in this area. To alleviate this contamination, wells are either taken out of service or blended with water from clean sources to ensure that the public receives water with TCE/PCE concentrations below the State's guidelines. Status June 10, 1986): EPA and the Los Angeles Department of Water and Power are entering into a cooperative agreement for a remedial investigation of the San Fernando Valley Basin and a feasibility study targeted at Area 1, the most contaminated area. The RI is scheduled to begin in early 1986.

Site Description: The North Hollywood-Burbank Well Field is located within the North Hollywood National Priorities List (NPL) Site, which is one of four NPL sites in the San Fernando Valley. It is also located in the San Fernando Valley Groundwater Basin. The sites were proposed for inclusion on the NPL because of the discovery of trichloroethylene and other volatile organic contaminants (VOCs) in the groundwater. The San Fernando Valley Groundwater Basin comprises 112,000 acres of valley fill situated among the Coastal Ranges within the Los Angeles metropolitan area. The area is used for residential, commercial, and industrial purposes. Groundwater from the basin is distributed by various municipalities and water districts to the residents of the metropolitan area. The Los Angeles Department of Water and Power (DWP) operates the North Hollywood-Burbank Well Field to provide drinking water to the residents of the City of Los Angeles,

SAN FERNANDO VALLEY (AREA 1) (Continued)

1000709322

located to the south of the San Fernando Valley. The San Fernando Groundwater Basin can provide drinking water for approximately 500,000 people residing in the San Fernando Valley and Los Angeles. In times of water shortages, the groundwater shortage can be drawn upon to supply about one million people. It is also an important source of water for the Cities of Burbank, Glendale, and San Fernando. The North Hollywood Operable Unit (NHO) is one of two geographically-defined operable units within the San Fernando Valley (SFV) (Area 1) Superfund Site. The NHO comprises approximately 4 square miles of contaminated groundwater underlying an area of mixed industrial, commercial, and residential land use in the community of North Hollywood (a district of the City of Los Angeles). The NHO is approximately 15 miles north of downtown Los Angeles and immediately west of the City of Burbank, and has approximate Site boundaries of Sun Valley and Interstate 5 to the north, State Highway 170 and Lankershim Boulevard to the west, the Burbank Airport to the east, and Burbank Boulevard to the south. The EPA is the lead agency for the current and planned future groundwater remedial activities at the NHO. The EPA's response activities at the NHO are and have been conducted under the authority established in the federal Superfund law, the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), as amended, 42 U.S.C. Section 9601 et seq. The lead state agency is the California Department of Toxic Substances Control (DTSC). The Los Angeles Regional Water Quality Control Board (RWQCB) has provided and continues to provide substantial support, particularly with the investigation and cleanup of sources of contamination in the SFV. The expected source of cleanup monies for the NHO is an enforcement settlement with the Potentially Responsible Parties (PRPs). Prior to World War II, most land in the SFV was occupied by farms, orchards, and ranchland. By 1949, after the war, nearly all the land in Burbank and North Hollywood was occupied by housing developments, industrial facilities, retail establishments, and the Burbank Airport. Accompanying these land use changes in the 1940s was a substantial increase in population and groundwater withdrawals from the SFV. In the 1950s, the North Hollywood, Erwin, Whitnall, and Verdugo Well Fields were constructed by the Los Angeles Department of Water and Power (LADWP) in the North Hollywood area to meet the increasing demand for water. In 1968, groundwater withdrawals from the SFV were reduced to achieve "safe yield" from the basin, and more surface water was imported to the basin from external sources. In 1979, industrial contamination was found in groundwater in the San Gabriel Valley (to the east of the SFV), prompting the California Department of Public Health (CDPH; formerly the California Department of Health Services) to request that all major water providers in the region, including those in the SFV, sample and analyze groundwater for potential industrial contaminants. Trichloroethylene (TCE) and tetrachloroethylene (PCE) were consistently detected in a large number of production wells in the SFV at concentrations greater than Federal and State Maximum Contaminant Levels (MCLs) for drinking water. TCE and PCE were widely used in the San Fernando Valley starting in the 1940s for dry cleaning and for degreasing machinery. Disposal was not well regulated at that time, and releases volatile organic compound (VOC)-contaminated groundwater that extends from the NHO to the southeast. To replace wells within the NHO area contaminated by TCE and PCE, and to provide more operational flexibility for groundwater recharge and pumping in the SFV, LADWP constructed the Rinaldi-Toluca Well Field in 1988 and 1989, and the Tujung Well Field in 1993. Based on the significant levels of groundwater contamination present in the SFV and the impact of that contamination on numerous municipal water supply wells, EPA added four SFV Sites to the National Priorities List (NPL) in 1986 and defined them as areas of regional groundwater contamination. Three of the four Sites (Areas 1, 2 and 4) are contiguous areas within whose boundaries are well fields that serve the water supply systems for the cities of Los Angeles,

MAP FINDINGS

SAN FERNANDO VALLEY (AREA 1) (Continued)

1000709322

Burbank and Glendale. There is a large, continuous plume of groundwater contamination that runs through these three Sites. The fourth Site, Area 3, lies in the Verdugo basin, a geographically separate area of the eastern San Fernando Valley. In the SFV Area 1 Site, located at the upgradient end of the contaminated groundwater plume, the selection and implementation of the initial interim remedy - the Existing NHOU Extraction and Treatment System - for the LADWP's North Hollywood well field was given fast-track status because of the potential for contamination to spread to other well fields and areas of uncontaminated groundwater. In 1986, LADWP completed the Operable Unit Feasibility Study for the North Hollywood Well Field Area of the North Hollywood-Burbank NPL Site, which was the basis for selection and implementation of the Existing NHOU Extraction and Treatment System. The 1987 Record of Decision (ROD) for the Site selected the Existing NHOU Extraction and Treatment System as an interim groundwater containment remedy. In 1989, LADWP constructed the Existing NHOU Extraction and Treatment System with financial support from EPA. The Existing NHOU Extraction and Treatment System consists of eight groundwater extraction wells (NHE-1 through NHE-8), an air-stripping treatment system to remove VOCs from the extracted groundwater, activated carbon filters to remove VOCs from the air stream, and ancillary equipment. The treated groundwater is discharged into an LADWP blending facility where it is combined with water from other sources before entering the LADWP water supply system. The Existing NHOU Extraction and Treatment System commenced operation in December 1989 and remains in operation today. In 1989, EPA issued a ROD for the Burbank OU (BOU) of the SFV Area 1 Site. That ROD also selected an interim remedy (containment) for the VOC-contaminated groundwater within the Burbank area, where ten of the city's water supply wells had been shut down due to contamination. The BOU remedy, which provides treated water for the City of Burbank's water supply system, began operation in 1996 and remains in operation to this day. OU01 1991 ESD: In June 1986, the United States Environmental Protection Agency (EPA) evaluated the threat posed by a number of well fields within the San Fernando and Verdugo Groundwater Basins, and designated them as National Priorities List (NPL) hazardous substance sites. Industrial chemicals had been detected in groundwater from these areas. Although four sites in the basin were listed on the NPL, EPA and DWP are managing the investigation of the four sites and the adjacent area as a single project consistent with the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) Section 104(d)(4). The San Fernando Valley Groundwater Basin (SFVGB) has historically been, and continues to be, an important source of drinking water for the Los Angeles metropolitan area, including the unincorporated area of La Crescenta, and the cities of Burbank, Glendale, and San Fernando. The groundwater basin provides these communities with enough water to serve approximately 600,000 residents. Groundwater from the SFVGB is used for residential, commercial, and industrial purposes, and is especially important during years of drought. The groundwater that has become contaminated is difficult to replace. The current water supply from surface water may not always be available in the future because of periodic drought conditions and state and federal water rights issues. The Burbank Operable Unit (OU) was developed to address the areal extent of groundwater contamination that is presently generally located in the area of the Burbank Well Field and including any areas to which the groundwater contamination migrates. The Site is part of the SFV Area 1 (North Hollywood) NPL site and includes an area beyond that originally designated as SFV Area 1. The City of Burbank's production wells have been shut down because the water they produce contained trichloroethylene (TCE) and perchloroethylene (PCE) in concentrations exceeding state and federal maximum contaminant levels (MCLs). Consequently, the City of Burbank now purchases 100 percent of its water, which is imported supply, from the Metropolitan Water District of

Southern California (MWD). On June 30, 1989, the U.S. Environmental Protection Agency (EPA) signed a Record of Decision (ROD) for the San Fernando Valley (SFV) Area 1 - Burbank Operable Unit (Burbank OU). The Burbank OU is the second OU, but is named OU03 at the SFV Area 1 NPL site. The purpose of this Explanation of Significant Differences (ESD) is to explain the significant differences between the interim remedial action originally selected in the 1989 ROD and the interim remedy which will be implemented at the Site. EPA is issuing this ESD in order to take into account technical data received after the ROD was signed in June of 1989 and to clarify any ambiguities regarding the selected remedy. An Explanation of Significant Differences addressing OU01 the San Fernando Site was completed in November, 1990. Operable Unit 3: The following gives a brief background of the Burbank Operable unit (OU) and a short summary of the remedy selected in the Record of Decision (ROD) and modified by Explanation of Significant Differences (ESD) 1. Further background information can be found in the ROD (dated June 30, 1989), and in ESD1 (dated November 20, 1990), as well as in other documents in the Burbank OU Administrative Record. In June 1986, the U.S. Environmental Protection Agency (EPA) evaluated the threat posed by groundwater contamination at a number of water supply wellfields within the San Fernando Valley and Verdugo groundwater basins. The chief contaminants of concern are trichloroethylene (TCE) and perchloroethylene (PCE). As a result of its investigation, EPA designated four wellfield areas as National Priorities List (NPL) sites. EPA is managing the four sites as a single project consistent with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) Section 104(d)(4). The San Fernando Valley Groundwater Basin has historically been an important source of drinking water for the Los Angeles metropolitan area, including the City of Burbank. The groundwater basin provides enough water to serve approximately 600,000 residents. Groundwater extracted from the basin is especially important during years of drought. Due to contamination by volatile organic chemicals (VOC), including TCE and PCE, beneficial use of the groundwater resource has been partially lost. Surface water supplies have replaced the lost resource, but are costly, and may not be available in the future due to periodic drought conditions and the potential for changing water rights policy. The Burbank OU is located within the San Fernando Valley groundwater basin and encompasses wellfields which were operated by the City of Burbank prior to being shut down as a result of contamination. The Burbank OU was specifically developed to address this areal extent of groundwater contamination. The City of Burbank's production wells have been shut down since the early 1980s because of the presence of TCE and PCE in concentrations exceeding federal and state Maximum Contaminant Levels (MCL). Consequently, the city purchases close to one hundred percent of its water from the Metropolitan Water District of Southern California, which supplies surface water imported from outside the San Fernando basin. (The city does operate a granular activated carbon groundwater extraction and treatment plant during parts of the year, but the contribution of this plant toward meeting the overall water demand is small). On June 30, 1989, EPA signed a Record of Decision (ROD) for the San Fernando Valley Area 1 Superfund Site, Burbank Operable Unit OU. On November 21, 1990, EPA signed an Explanation of Significant Differences (ESD1) modifying the interim remedial action selected in the ROD. A second ESD addressing the Burbank Operable Unit (Operable Unit 3) at the San Fernando Valley (Area 1) site was completed in February 1997. In December 1992, a remedial investigation (RI) for the SFV groundwater basin, including installation and subsequent regular monitoring of 84 groundwater wells, was completed under a cooperative agreement between EPA and the LADWP. The RI was conducted to evaluate the groundwater quality throughout the SFV basin and assist in identifying the best treatment method(s) and optimal locations to install groundwater treatment systems to address the SFV groundwater

SAN FERNANDO VALLEY (AREA 1) (Continued)**1000709322**

contamination EPA listed the SFV Sites as groundwater only, with the intent to focus on addressing the regional groundwater contamination, with an agreement with the state agencies to address the sources. From the late 1980s to late 1990s, EPA provided funds to RWQCB to conduct assessments of facilities in the SFV to determine the extent of solvent usage and to assess past and current chemical handling, storage, and disposal practices. These investigations were conducted pursuant to RWQCB's Well Investigation Program and resulted in source remediation activities under RWQCB oversight at several facilities within the SFV, including two within the NHOU. Source investigations and remediation activities are currently in progress under the lead of RWQCB and DTSC. In 1993, 1998, 2003, and 2008, EPA conducted five-year reviews (as required by CERCLA) to evaluate the protectiveness of the NHOU interim remedy. The Third NHOU Five-Year Review reported that the TCE and PCE groundwater plume that the remedy was designed to capture was migrating vertically and laterally beyond the remedy's zone of hydraulic control. This conclusion was based largely on EPA's evaluation of the current NHOU groundwater conditions and LADWP findings in the Draft Evaluation of the North Hollywood Operable Unit and Options to Enhance Its Effectiveness. The Final Evaluation of the North Hollywood Operable Unit and Options to Enhance Its Effectiveness also raised concerns regarding detections of total chromium and hexavalent chromium in extraction well NHE-2 of the NHOU interim remedy. Well NHE-2 is located just a short distance from the former Bendix facility, one of the major VOC sources in the NHOU. In July 2006, after a year of unusually high rainfall and rising groundwater levels in the SFV, the total chromium concentration detected at NHOU extraction well NHE-2 began to increase. Chromium was used in the metal plating and aerospace industry (metal fabrication), as well as for corrosion inhibition in industrial cooling towers, from the 1940s through the 1980s. It was also used extensively at the former Bendix facility. In 2007, the elevated concentrations of chromium at well NHE-2 caused total chromium concentrations in the combined NHOU treatment system effluent to exceed 30 micrograms per liter (ug/L) (60 percent of the state MCL). As a result, CDPH advised LADWP to shut down well NHE-2 or divert the water produced by the well to a nonpotable use. Chromium concentrations at this well have subsequently ranged from approximately 280 to 440 ug/L. In addition, 1, 4-dioxane was detected at well NHE-2 during 2007 and 2008 at concentrations ranging from 4 to 7 ug/L. There is no MCL for 1, 4-dioxane, but the CDPH notification level for 1, 4-dioxane is 3 ug/L. Extraction well NHE-2 remained shut down until September 2008, when the installation of a wellhead VOC treatment unit and modification of the discharge piping were completed, which allowed this well to return to service. The NHE-2 effluent, which still contains elevated levels of chromium, is currently discharged to the Los Angeles Bureau of Sanitation sewer system. This work was conducted by Honeywell International (a corporate successor to Bendix) as an interim measure, pursuant to a Cleanup and Abatement Order (CAO) from RWQCB that requires Honeywell to clean up the chromium contamination and to restore lost water caused by the shut down of well NHE-2. A long-term wellhead treatment system for well NHE-2, including treatment for chromium and, if necessary, 1,4-dioxane, to meet drinking water standards is expected to be implemented pursuant to the RWQCB CAO prior to the implementation of the NHOU Second Interim Remedy. Following construction and start up of the Existing NHOU Extraction and Treatment System, EPA issued general and special notice letters to PRPs. In 1996 and 1997, EPA reached two separate settlements with PRPs in which the settling parties agreed to pay EPA's past costs and fund operation of the Existing NHOU Extraction and Treatment System for the remainder of its fifteen-year term. In 2008, when the funds collected pursuant to the 1996 and 1997 settlements were close to being exhausted, EPA entered into an administrative order on consent with a number of parties from 1996 and 1997 settlements and issued a unilateral administrative

MAP FINDINGS

SAN FERNANDO VALLEY (AREA 1) (Continued)

1000709322

order to the remaining viable parties in order to secure funding to continue operating the Existing NHOU Extraction and Treatment System until the Second Interim Remedy is constructed and operational. In preparation for the selection and implementation of the Second Interim Remedy, EPA has conducted additional PRP search activity. The RWQCB has issued CAOs to two parties in the NHOU. In December 1987, Lockheed was issued a CAO directing it to remediate contaminated soil and groundwater at Plant B-1 (in the BOU) and to complete a comprehensive Site assessment at all of Lockheed's other Burbank Airport facilities, including Plants B5 and C1 (in the NHOU), to determine the sources and extent of soil and groundwater contamination. The RWQCB issued a CAO in February 2003 to Honeywell International, Inc., for VOC and chromium contamination in groundwater at the former Bendix facility in North Hollywood. This CAO was amended in April 2007 to include investigation and mitigation of emerging contaminants at the former Bendix facility and to address elevated chromium concentrations at NHOU extraction well NHE-2. The land use in the SFV Area 1 Site, including the NHOU, consists of mixed residential, industrial, and commercial use. The SFV is fully developed and land uses in the NHOU are not expected to change significantly in the next 20 years or longer. The SFV groundwater basin is an important source of drinking water for the Los Angeles metropolitan area, including the cities of Los Angeles, Glendale, Burbank, and San Fernando. The SFV is located in the Upper Los Angeles River Area (ULARA), which is under adjudicated water rights regulated by the ULARA Watermaster. Through court action in 1975, the City of Los Angeles was granted rights to all groundwater in the San Fernando Basin that is derived from precipitation within ULARA. There are a number of production well fields in the eastern SFV, including six LADWP well fields located in or near the NHOU. The output from the existing NHOU remedy accounts for approximately 1 to 2 percent of LADWP's total extraction from the SFV groundwater basin. The need for drinking water development in the eastern SFV, including the NHOU, is expected to increase over the next 20 years as restrictions on importing water to Southern California increase and imported water becomes more expensive. An Interim ROD addressing Operable Unit 4 was completed in September 2009.

Background Info:	The San Fernando Valley Ground Water Basin (SFVGWB) is located within the Upper Los Angeles River Area, and consists of the eastern portion of the San Fernando Valley and the entire Verdugo Basin. The SFVGWB encompasses approximately 112,000 acres of alluvial valley fill deposits and provides enough water to serve approximately 600,000 residents. The Basin is bounded on the north and the northwest by the Santa Susana Mountains, on the northeast by the San Gabriel Mountains, on the west by the Simi Hills and on the south by the Santa Monica Mountains.

SAN FERNANDO VALLEY (AREA 1) (Continued)

1000709322

The San Fernando Valley Study area includes four National Priorities List (NPL) sites. They are:

Area #1 - North Hollywood NPL Site covers 9336 acres in the eastern part of the San Fernando Valley. The site has been divided into the North Hollywood Operable Unit(OU) and the Burbank OU.

Area #2 - Crystal Springs NPL Site covers 3975 acres located southeast of the North Hollywood NPL site and is in the cities of Glendale and Los Angeles.

Area #3 - Verdugo NPL Site covers 2673 acres in the eastern part of the SF Valley and is located in and adjacent to La Crescenta in the Verdugo Mountains.

Area #4 - the Pollock NPL Site covers 1635 acres in the south-eastern part of the San Fernando Valley and is located in and adjacent to the cities of Los Angeles and Glendale.

Groundwater contamination in the SFVGWB is linked to prewar, postwar, and current industrialization in the San Fernando Valley.

The primary contaminants of concern are the volatile organic compounds (VOCs) trichloroethylene (TCE) and tetrachloroethylene (PCE). These compounds have been and/or are being used in many San Fernando Valley industries, such as aeronautical, automotive dry cleaning, and metal plating. These solvents have found their way to the groundwater basin as a result of both past and improper use, storage and disposal practices. The SFVGWB Superfund sites, added to the NPL in 1986, are areas where groundwater from wells have been found to contain VOCs above the state and federal drinking water standards. Groundwater contamination in numerous wells have been so severe with TCE and PCE that these wells have essentially been put out of commission. Exposure of receptors to contaminants can possibly occur through ingestion of contaminated drinking water, inhalation of VOC vapors released from the contaminated water as in taking showers, and dermal exposure as in washing or bathing. However, with the strict regulatory control over water quality by the State's Department of Health, Office of Drinking Water (ODW), the RWQCB, and other agencies, residents are assured that the water they consume is safe and that no one is drinking water which contains concentrations of contaminants above regulatory standards. Federal, state, and local agencies have been conducting investigations and cleanup of contaminated groundwater in the San Fernando Valley since contamination was discovered in 1979. These activities involve measuring the extent of contamination, developing and implementing cleanup remedies, and identifying responsible parties. EPA provided oversight of the basinwide Remedial Investigation (RI) of groundwater contamination conducted by the Los Angeles Department of Water and Power (LADWP). The RI objectives were to collect lithological and water quality data and information regarding basin operations for the eastern SF and Verdugo basins; develop a regional characterization of geology, hydrology, hydrogeology and the nature and extent of groundwater contamination within the eastern and Verdugo basins; study fate and transport of compounds in the environment; identify Applicable or Relevant and Appropriate Requirements; (ARAR's) and evaluate the potential risk to human health and the environment. The Remedial Investigation of the SFVGWB was divided into two

phases.

Phase I activities have included vertical profile borings and installation of monitoring wells to obtain preliminary contamination information. Monitoring wells have been installed as follows: 34 in North Hollywood (Area #1); 29 in Crystal Springs (Area #2); 7 in Verdugo (Area #3); and 17 in Pollock (Area #4).

Information obtained from Phase I investigation activities identified the need for several operable units. Operable Unit is a federal term which is similar to the State's definition of a removal action.

Phase II activities consist of a basinwide remedial investigation conducted by the LADWP.

Remedial Actions (RAs):

North Hollywood (Area #1) -- Two RAs were identified for Area #1, the North Hollywood OU and the Burbank OU.

A Record of Decision (ROD) for the North Hollywood RA was signed in September 1987, selecting groundwater extraction and treatment (air stripping) of 2,000 gallons per minute (gpm) of contaminated water as an interim remedy. This RA was constructed with funding from EPA and the State and has been treating contaminated groundwater since March 1989. This facility is located at 11845 Vose Street in the N. Hollywood section of Los Angeles.

A ROD for the Burbank OU was signed in June 1989, again selecting groundwater extraction and treatment of about 12,000 gpm of contaminated water. Phase I of the Burbank OU began operations in January 1996 treating groundwater at a rate of 6,000 gpm. Phase II began operations in May 1998 adding an additional 3,000 gpm to the Burbank OU's treatment capacity.

Crystal Springs (Area #2) -- LADWP has completed a focused RI/FS for this proposed RA. The Glendale OU has been separated into a North OU and a South OU based on the amount of contamination and the facilities contributing to the GW contamination. A ROD for each OU was signed on June 18, 1993 designating groundwater extraction and treatment as the interim remedy. The PRPs have formed a group and combined the RA efforts for each OU into one document. The selected alternative is GW extraction and treatment. The Glendale OU began operations in September 2000.

Verdugo and Pollock (Areas #3 and #4) --

Currently no RAs have been identified for Area #3 or for Area #4.

In October 2003 US EPA proposed No Remedial Action for Verdugo Basin (Area #3).

Another contaminant of concern, hexavalent chromium, has been identified in the San Fernando Valley Groundwater Basin.

EPA and the RWQCB are currently identifying potential sources of contamination and pursuing PRPs that may be responsible for contaminating groundwater. As these PRPs are identified, individual site investigations and mitigation activities will be pursued. Enforceable agreements and orders will be implemented at numerous specific potential source sites within the Basin by RWQCB and DTSC

Comments Date:

01011984

Comments:

Groundwater contaminated with TCE and PCE is discovered.

Environmental Interest/Information System

California Department of Toxic Substances Control EnviroStor System (DTSC-EnviroStor) is an online search and Geographic Information System (GIS) tool for identifying sites that have known contamination or sites for which there may be reasons to investigate further. The EnviroStor database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites.

CERCLIS (Comprehensive Environmental Response, Compensation, and Liability Information System) is the Superfund database that is used to support management in all phases of the Superfund program. The system contains information on all aspects of hazardous waste sites, including an inventory of sites, planned and actual site activities, and financial information.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when

complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

HAZARDOUS AIR POLLUTANT MAJOR

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Case Worker: LR
Local Agency: Not reported
RB Case Number: 104.0150
File Location: All Files are on GeoTracker or in the Local Agency Database
Potential Media Affected: Aquifer used for drinking water supply, Soil
Potential Contaminants of Concern: Chromium VI
Site History: The Site was formerly occupied by Aviall, Inc. (Aviall), which conducted metal finishing operations as a function of its aviation manufacturing processes. The Site was investigated, by the Regional Board, for total petroleum hydrocarbons, VOCs and heavy metals. In May 1992, a Well Investigation Program Phase II Report (Phase II Report) was submitted to the Regional Board by SCS Engineers, describing the results of a soil investigation conducted at the Site. The Phase II Report confirmed a release of heavy metals at the location of the former plating shop and limited soil excavation and removal was performed.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

 Site History:

Actual:
727 ft.

The Site was included as part of the US EPA Superfund investigation on VOC impacted areas in San Fernando Valley. The investigation was concluded jointly by USEPA and LARQWCB, on December 31, 1996, that the Image Transform Laboratory is No longer part of the USEPA Superfund process, and USEPA and Regional Board plan no further action concerning the facility. The closure was granted with respect to the VOC investigation conducted under the Well Investigation Program (WIP) during that time. The case was a WIP case only, and never was an open SLIC Case under the Regional Board's oversight.

Environmental Interest/Information System

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

SIC Code: 3643

SIC Code 2: Not reported

Primary Waste Type: Designated/Influent or Solid Wastes that pose a significant threat to water quality because of their high concentrations (E.G., BOD, Hardness, TRF, Chloride). 'Manageable' hazardous wastes (E.G., inorganic salts and heavy metals) are included in this category.

Primary Waste: STORMS

Waste Type2: Not reported

Waste2: Stormwater Runoff

Primary Waste Type: Designated/Influent or Solid Wastes that pose a significant threat to water quality because of their high concentrations (E.G., BOD, Hardness, TRF, Chloride). 'Manageable' hazardous wastes (E.G., inorganic salts and heavy metals) are included in this category.

Secondary Waste: Not reported

Secondary Waste Type: Not reported

Design Flow: 0

Baseline Flow: 0

Reclamation: No reclamation requirements associated with this facility.

POTW: The facility is not a POTW.

Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.

Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or those who must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

HAZARDOUS AIR POLLUTANT MAJOR

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or those who must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

File Location: Regional Board
Potential Media Affected: Aquifer used for drinking water supply, Indoor Air, Other Groundwater (uses other than drinking water), Soil, Soil Vapor, Under Investigation

Actual:
689 ft.

Potential Contaminants of Concern: Not reported

Site History: After reviewing (1) Vapor Extraction System Operation Report dated December 19, 2008, and (2) Temporary VES Operation Report & Closure Borings Workplan dated August 12, 2009, Regional Board staff M. Zaidi had a meeting on 11/10/2009 with the RP and staff of The Source Group at the site. Mike Wood of the Source Group sent an email to Mr. Zaidi summarizing the meeting notes, which were reviewed and amended by Mr. Zaidi and sent back to Mr. Wood in an email dated 11/25/09. After collecting soil gas samples from the wells, The Source Group will submit a technical report after receiving the analytical results of the soil gas samples to the Regional Board staff for their review. The RP consultant has collected soil gas samples for a rebound test on 2/19/2010, and plans to drill two confirmation soil borings in March 2010. Regional Board staff issued a No Further Requirements for Soil Only letter dated 3/30/11 for the Former Premier Cleaners site. The Site was found to be an open lot during staff's site inspection in 2010.
